Mr. R. J. Pugh pointed out that in a resolution proposed by Mr. A. Withy at the previous meeting of the committee it was stated that salicylates, amongst other products, had advanced in price to nearly double, which was not true in the case of his (the speaker's) chief product, sodium salicylates. The supply was also quite equal to the demand for this product—in fact, his own business was 90 per cent. export. Mr. Pugh was asked why, if only 10 per cent. of his sodium salicylate was for home consumption, he required to be protected against the import of foreign sodium salicylate. He replied that though his own business was chiefly for foreign markets, this was not the case of many other manufacturers. Mr. Keene reminded Mr. Pugh that a day or so before the meeting at which the resolution was passed, he (Mr. Pugh) was not able to supply salicylic acid for a month, and was quoting 1s. 6d. a pound, whereas Mr. Keene could have sold the American salicylic acid for 1s. 3d. There was no question of dumping at a lower price here. The acid had been bought in America at a very low figure just before it increased considerably in price, and, therefore, after adding the cost of freight and insurance and leaving a reasonable margin for profit, the American product could be legitimately sold in this market at a lower price than the British. Mr. Pugh then protested that the resolution stated that the import restrictions had raised the price to nearly double. In his opinion that was not correct. It was pointed out, however, that on the average it was so, because some of the chemicals mentioned had risen 300 per cent. After a lengthy discussion the committee decided that sodium salicylate should be excluded from the resolution, though it appeared to be perfectly correct to include all other salicylates and their derivatives.

CUSTOMS STATISTICS.

The following letter, it was announced, had been sent on behalf of the Committee on Drugs, Chemicals, and Dyestuffs to the Board of Trade:—

"The Committee on Drugs, Chemicals, and Dyestuffs of the American Chamber of Commerce in London beg to draw the attention of the Board of Trade to the disadvantages under which the industry of this country suffers by reason of the lack of detailed information as to the quantities of specific drugs and chemicals imported into and exported from the United Kingdom.

"It is impossible to ascertain of which drugs the present returns consist, and without such detailed information it is impossible for any industry to ascertain—(a) What the country's requirements are for any particular product; (b) the demand abroad for the same products.

"We are confident you will realise that the present position of industry and the unsatisfactory rate of exchange require that all available information should be forthcoming to enable manufacturers and merchants to concentrate upon the goods most urgently needed abroad, and to avoid unnecessary importation. Information upon these two essential points would be provided by the compilation of the statistics suggested below. An added advantage is that the American authorities are arranging for the provision of improved trade statistics throughout the United States, and an exchange of

these particulars between the two countries would, we believe, afford a profitable opportunity for co-operation.

"The particulars of exports and imports which occur to this committee as most urgently needed may be summarised under the following headings:—

1. The name of the chemical, drug, or dyestuff, raw or manufactured.
2. The total weight of each separate article.
3. The total value, f.o.b. and c.i.f., of each separate article.
4. Countries of origin arranged in order of their participation, and showing the percentage of such participation.

"The publication of such statistics monthly would serve, in the opinion of this committee, not only as a valuable guide to merchants, but would permit of intelligent guidance of domestic chemical industries through the dangers of foreign competition."

DYESTUFF LICENSING SYSTEM.

Reference was made to the fact that the British Chemical Trade Association was drawing up a petition for presentation to the Premier, protesting against the present constitution of the Licensing Sub-Committee and also against the appointment of Messrs. Fairclough, Dodd, and Jones (under the name of the "Central Importing Agency") as the Government's agents in connection with the importation of dyestuffs from the United States.

Mr. S. J. C. Mason, hon. secretary of the British Chemical Trade Association, asked that the Chamber should obtain as many signatures as possible on the petition forms. Good support already had been received, and in this connection Mr. Keene read one of the resolutions of the Association of British Chambers of Commerce to be considered at their next meeting, which "demanded the immediate removal of all restrictions on the importation of dyestuffs and the abolition of the Licensing Sub-Committee appointed by the Board of Trade to control such imports, or the representation on such a committee of the smaller manufacturers, of merchants, and of the independent consumers."

In regard to the combined sub-committee appointed by the American Chamber of Commerce and the British Chemical Trade Association, Mr. Mason stated it was hoped that the Government would grant an interview to the deputation, and suggested that it might be considered essential for, at any rate, a proportion of the representatives of such a deputation to have technical knowledge. It seemed likely that if the deputation took place the Government's representatives would have extensive technical experience, and it would be necessary for the delegates to meet them on their own ground.

Mr. Keene pointed out that nearly all the members of the Chamber interested in the subject of dyes were merchants. He was of the opinion that the merchants knew better than anyone where the present system of licensing dyes and chemicals was at fault, and it would not need any technical knowledge to put their case to the Government.

IMPORTATION OF LACTIC ACID.

At the close of the meeting Mr. J. Hilborn asked whether the committee could help him to import lactic acid from America. He understood it was prohibited. It was not a key industry, as only a very small amount of commercial lactic acid was manufactured in this country, and he believed that no edible lactic acid was made at all.

The committee agreed that it would be quite permissible for them to take action in the matter if full details were put before them.

RESEARCH IN THE NON-FERROUS METAL INDUSTRIES.

CO-OPERATIVE SCHEME AT BIRMINGHAM.

AN interesting co-operative scheme, within the domain of science and technology, in relation, primarily, to the non-ferrous metal industries, has recently been inaugurated in Birmingham. It is an example of what may be accomplished by groups of firms in association. The aim of the movement, known as the Midland Laboratory Guild, is to provide facilities by which small manufacturing firms, who cannot afford the cost of laboratory practice, may invoke the aid of science. By means of co-operation on the part of ten firms engaged in different branches of trade, but all interested in, and using, non-ferrous metals and alloys, a system of scientific control has been organised to meet their requirements without attempting to instal separate laboratories in each individual works. The work is entirely on a non-profit basis, and is restricted in a large measure to the firms concerned; in other words, outside work is not sought, though from time to time applications for analyses, determinations, etc., are dealt with. The organisation is in the form of a company registered under the Board of Trade and limited by guarantee. The objects are as follows:—

"To promote, maintain, and control scientific work in connection with the non-ferrous trade or industry, and also any other metal trade or industry carried on by any one or more members of the Guild for the time being; to establish, equip, and maintain chemical, metallurgical, physical, and mechanical laboratories to carry on the work of analytical and metallurgical chemists; as also the physical and mechanical examination of metals and metallic alloys, and of all substances and processes carried on by any member of the Guild in his trade or manufacture."

The equipment in King Alfred's Place provides for: (1) A complete chemical laboratory fitted with every necessary appliance, and affording special facilities for electro-chemical methods of analysis, as also for the examination of fuels and refractory materials, to which subjects considerable attention will be paid; (2) a metallographic laboratory fitted with one of the latest and most complete types of photomicrographic apparatus, together with photographic dark-room; (3) a physical testing laboratory, the plant of which consists, *inter alia*, of a 25-ton Olsen testing machine, Brinell hardness-testing machine, Sankey bend-testing apparatus, a 5-inch Drummond lathe, drilling machines, etc.; (4) a pyrometric laboratory equipped for calibrating and testing thermo-electric pyrometers, effecting repairs and adjustments. One room has been set apart as a scientific library.

The administration of the laboratory is carried on by a committee or a board of directors, consisting of one member approved by each firm constituting the membership. This committee is responsible for the financial and commercial administration of the scheme, but not for the scientific control. This latter is provided for by means of a small consultative board of three metallurgists, who are jointly responsible for the scientific equipment and methods, and to whom special technical problems which may crop up can be referred. The immediate management of the laboratory and staff is in the hands of Mr. Seymour Pile, M.A. (Camb.). This pioneer movement will be, it is hoped, an important factor in paving the way for research associations.

FRENCH CUSTOMS DUTIES ON CHEMICAL PRODUCTS.

THE French Senate on October 18 adopted a Bill, which had already been adopted by the Chamber of Deputies, to revise the existing French Customs Tariff in so far as concerns chemical products, which deals also with the customs regime of German dyestuffs, etc., to be imported into France under the reparation clauses of the Peace Treaty. The Bill, as passed by the Senate, provides as follows:—

Article 1.—Under reserve of the provisions of Article 2 below, the Law of the 11th January, 1892, establishing the French Customs Tariff (as modified by the Laws of the 3rd March, 1892, 4th April, 1898, 10th July, 1899, 30th April, 1903, 21st November, 1906, 29th March, 1910, 7th June, 1911, 5th February, 1912, and 4th January, 1913), is completed and modified in conformity with the schedule attached to the present measure.

Article 2.—Colouring materials, chemical products, pharmaceutical products, and other products coming into France as the result of the levy imposed on Germany by the Peace Treaty (Annex XI. of the clauses relating to reparations) shall be admitted into France free of all customs duties. These products shall be distributed under Government control.

Until otherwise decided, licences must be obtained before any such colouring materials, chemical products, pharmaceutical products, etc., from Germany *in excess* of the levy imposed by the above-mentioned provisions of the Treaty of Peace, can be imported. With this reservation their importation shall be effected under the conditions laid down in the tariff.

Article 3.—All previous legal provisions contrary to the present Law are thereby repealed.

For the most part the provisions consist of a rearrangement and elaboration of the provisions of Section XVIII. of the existing Customs Tariff (Tariff Nos. 234-282—"Chemical Products"), but affect also certain other sections—*e.g.*, colours. The changes proposed under the Schedule are too numerous and complicated to be summarised. In some cases the duties are reduced, in others (and these appear to be the majority) they are increased. In some cases only the "general" rates of duty are amended, the "minimum" tariff rates (to which, of course, United Kingdom goods are subject) remaining unchanged. The existing tariff provision imposing *ad valorem* duties (7½ per cent. in the general tariff, and 5 per cent. in the minimum) on "chemical products not specified in the tariff" is superseded in respect of a large number of chemical products not enumerated in the present Tariff by specific rates.

From the official report of the proceedings in the Senate on October 18 it appears that the present measure is largely based on proposals made in 1915 by the "Syndicat des Produits Chimiques." Prices having increased considerably since that date, proposals were made that the new duties should be brought within the scope of the "co-efficient of increase" system (chemicals have hitherto been exempted from the co-officients of increase), and M. Clementel, the Minister of Commerce, intimated that the Inter-Departmental Commission established to revise the co-efficients of increase would immediately examine and give satisfaction to these proposals.—*Board of Trade Journal*.

ITEMS OF INTEREST.

SPANISH IMPORT DUTY ON SULPHUR BLACK.—Customs duty on thiocarbon (sulphur black) imported into Spain is now leviable at the rate of 25 centavos per kilogramme, under Tariff No. 204.

OIL AND COLOUR CHEMISTS' ASSOCIATION.—The November meeting of the Association will be held on the 13th inst. at the Food Reform Club, 2, Fumival Street, Holborn, London, E.C., at 7 p.m. At 7.30 p.m. a paper entitled "Monazo-dystuffs Suitable for the Production of Lake and Pigment Colours" will be given by Mr. W. Allsebrook.

ZINC AND ZINC DUST PRICES.—Australian high-grade zinc dust (88/92 per cent. metallic zinc) continues in exceptionally strong demand at £75. per ton, with practically very little offering for prompt supply. Australian electrolytic zinc (99.95 per cent. purity) is unchanged at £42. per ton, f.o.b., Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

GERMAN EXPLOSIVES WORKS' INCREASED CAPITAL.—After the announcement of the enormous increase in the capital of the German chemical companies, there follows an analogous announcement respecting the explosives factories, the whole group of which is about to double its capital. Thus the Köln-Rottweil Co. is increasing its present 33,000,000 marks capital to 66,000,000; the Rhine-Westphalian Explosives Company increases its capital from 13,000,000 to 26,000,000 marks; the Siegerner dynamite factory in Cologne from 600,000 to 1,200,000 marks. These three concerns belong to the so-called explosives group. The Dynamite Company, in Hamburg, which is in agreement with the group named, is also to double its capital—namely, from 36,000,000 to 72,000,000 marks.

FIRE.—A destructive fire occurred on Tuesday evening at the stores of Messrs. James A. Kemp and Co., varnish manufacturers, Birkenhead Road, Seacombe, near Liverpool. The Birkenhead and Wallasey brigades were quickly in attendance, and were confronted by a terrific blaze, a large number of barrels and drums of turpentine, linseed, and other oils and varnish having been ignited. The fire blazed furiously for an hour and a half, by which time the inflammable material involved had burned itself out. The damage is estimated at between £7,000, and £8,000., and is stated to be covered by insurance. It is believed that the fire was caused by the overflowing of a glue-pot on a stove in the varnish factory.—From an unknown cause a fire broke out last week on the premises of Messrs. Stafford Allen and Sons, Ltd., chemical manufacturers and drug grinders, of 7, Cowper Street, Finsbury, E.C. The fire was fortunately confined to the laboratory, where the contents were slightly damaged. George Harris, aged 58 years, was burned on the back, and had to be removed to hospital.—A disastrous fire broke out on Wednesday at the works of the Scottish Fish-oil and Guano Company, Ltd., near Falkirk. The damage is estimated at £50,000.

DISTILLATION OF HARD PITCH.—Hert A. Fischer, of Weinböhla, narrates in the *Journal für Gasbeleuchtung* that during the war the requirements of munition works enormously increased the demand for electrolytically deposited metals. For these, carbon electrodes must be provided; and in order to supply these they had to resuscitate the process of distillation of hard pitch, which had been abandoned. The material softens at from 140° to 167° F., so that any coking plant suitable for coal is not suitable for it. For distillation any form of brickwork or stonework is too porous. Large iron retorts are therefore used for the preliminary distillation, with a diameter from 5ft. to 9ft. Iron is not an ideal material, since it is attacked and wears away; but it is the best available. Still, the most careful handling is required in order to prevent overheating of the iron, which may even lead to collapse of the metal under the interior vacuum. The process is continued until some 30 to 40 per cent. has come over as oil, 4 to 6 per cent. as resin, with traces of ammonia and a certain quantity of uncondensed gases; and the residue is coked by continued heating. The difficulty is to extract the product; the retort is taken apart and the residue dug into. It is found to vary considerably from one part of the charge to another. The best parts contain 96 to 97 per cent. of carbon and $\frac{1}{2}$ to 1 per cent. soluble in benzole; and they are very porous. The ash rarely exceeds 1 per cent.—*Gas World*.

PERSONAL.—Mr. C. F. Chance was this week elected a member of the Birmingham City Council. He was managing director of Chance and Hunt Ltd., chemical manufacturers, Oldbury, and is a son of the late Mr. Alexander Chance.

LINSEED CROPS.—The production of linseed in Canada, the United States, British India, Italy, Japan, and Tunis for 1919 is estimated at 13,965,000 cwt., or 34.3 per cent. less than the previous year's production, and 35.5 per cent. less than the average production of the five years 1913-17.

EDIBLE OILS FREED FOR EXPORT.—Under a proclamation dated October 31 all edible oils and fats may now be exported freely without licence except coconut, groundnut, and palm kernel oil. Imitation (compound) lard, neutral lard, and mustard seed are also freed for export.

OBITUARY.—The death has occurred at his residence, 50, Armitage Road, Milnsbridge, near Huddersfield, of Mr. James Watson Leitch. He was 47 years of age, and was associated with his brother in the firm of Messrs. J. W. Leitch and Co. Ltd., chemical manufacturers, of Milnsbridge.

TURPENTINE SUBSTITUTE.—The operation of the Turpentine, etc., Control Order, 1918, is, by an Order of the Ministry of Munitions, suspended until further notice in so far as it relates to turpentine substitute as defined in the Order—namely, mineral turpentine, white spirit, white oil, or any product of petroleum (except motor spirit and benzine) capable of being used as a substitute for spirits of turpentine.

BUSINESS NOTICE.—Arrangements have been completed for the amalgamation of the business carried on by Mr. Robert W. Paul at New Southgate, London, with the Cambridge Scientific Instrument Company, Ltd. Mr. Paul will join the board of directors, and the manufacture of instruments will be continued both at Cambridge and at New Southgate. Until the end of the year the selling and manufacturing arrangements will be unchanged, but on January 1, 1920, the name of the company will be altered to the Cambridge and Paul Instrument Company Ltd., and as soon as possible the head office and showrooms transferred to London.

POLISH IMPORT RESTRICTIONS.—As a consequence of the exemption of so many classes of goods from the necessity of obtaining licences, the issue of licences by the Polish Commercial and Financial Agency in London has been suspended, and applications for permission to import into Poland goods not specified in the subjoined list must be addressed to the Polish Government Import and Export Commission, Elektoralna, 2, Warsaw. The importation of such goods also requires the authorisation of the Central Foreign Exchange Committee recently established by the Polish Government. Raw materials: Coal; coke; chalk, ordinary and purified; china clay (kaolin); potash and minerals for manufacture of glass; borax; raw celluloid; indiarubber; caoutchouc; silica sand; and cork bark. Metals, raw and semi-manufactured: Copper; aluminium; nickel; lead; tin; wolfram; mercury; metallic bismuth; ferro-manganese; ferro-silicon; iron ores; and tool steel. Chemicals: Acetate of lead; aniline dyes; printing inks; lithographic colours; formaline; phosphorus; lactic acid; oxalic acid; red arsenic; borax chloride; ferric-chloride; acetone; benzole; naphthaline; bisulphide of carbon; and aniline.

PROPOSED GERMAN-AUSTRIAN CARBIDE MONOPOLY.—Until now, water-power installations have been adapted to the supply of water available with certainty during nine months of the year; but it would be better if they were enlarged so that the greatest quantity of water available at any time could be utilised. A steady supply of energy should then be delivered at a high price during the whole year to the consumers of light and power, whilst the excess, available only from time to time, would serve for selected chemical factories using only cheap current and making a product easy to be stored and not requiring further treatment. The manufacture of calcium carbide, which could be carried on intermittently, fulfils these conditions, and it would be possible to make 6,500,000 tons of this material from the 500,000 metric tons of gas-coke annually produced in Germany and Austria. The necessary electrical energy (5.76 million kilowatt-hours) could be provided by the excess energy of the enlarged water-power stations, and the cost of electrical power would be reduced to all consumers. Carbide, to the value of 910 million kroner per year, could be produced, and at a much lower cost than obtains in most other countries. This industry is well suited to be a State monopoly.—*Zeit. für ange. Chem.*, through *Tech. Rev.*

CANADIAN CHEMICAL INDUSTRY.

THE enormous impetus given to the Canadian chemical industry, due to exceptional demands during the war, is shown in a report issued by the Dominion Bureau of Statistics, prepared for the Honorary Advisory Council of Scientific and Industrial Research. This report contains a directory of Canadian chemical industries, with names, addresses, and products of firms. The number of plants operated is given as 634, 161 of which are situated in the Province of Quebec.

The outstanding progress made during the war was probably the construction of the world's largest glacial acetic acid plant at Shawinigan, Quebec. An entirely new process beginning with acetylene was developed, while acetone, paraldehyde, crotonaldehyde, mercuric oxide, and manganese acetate are now also produced, and magnesium of a purity ranging from 99 per cent. to 99.9 per cent. is made electrolytically from its fused salts.

The following figures show the increase in value of exports of Canadian drugs, dyes, and chemicals during the fiscal years March 31, 1912-19: 1912, \$1,677,216; 1913, \$1,800,437; 1914, \$1,730,203; 1915, \$3,543,701; 1916, \$6,449,145; 1917, \$9,218,415; 1918, \$14,207,609; 1919, \$17,053,074. The imports for consumption of drugs, dyes, and chemicals into Canada in the last fiscal year amounted to \$32,788,704, of which \$28,785,191 represents the value of chemical products imported from foreign countries, and \$4,003,513 the value of such products imported from British markets.

PARLIAMENTARY NEWS.

Quality of British Dyes.

In the House of Commons on Monday, Major McKenzie Wood asked the President of the Board of Trade whether he is aware that the subsidised dye manufacturers are supplying to woollen manufacturers dyes which are not fast to milling; whether, in consequence, large quantities of good material are being spoiled weekly; and whether he will take steps to enable woollen manufacturers to obtain dyes which can be guaranteed?

Sir A. Geddes: No, Sir. I have no information of the kind suggested, but if the hon. and gallant member will furnish me with any concrete evidence on the subject I shall be glad to receive it.

Major Wood: Have not certain manufacturers already communicated with the Board of Trade on this subject?

Sir A. Geddes: Yes, Sir, I have frequent communication from manufacturers, but I have had none on this specific question.

Major Wood: I will send the right hon. Gentleman particulars.

Cement.

Captain R. Terrell asked the President of the Board of Trade if he is aware that the short supply of cement in this country is hampering building operations in the home counties; whether he is aware that quantities are being sent abroad, presumably at a higher price; and whether the Government will take steps to secure that an adequate amount of cement is available for home needs before overseas demands are supplied?

Mr. Kellaway: I have been asked to answer this question. There are considerable stocks of cement in manufacturers' works, but delivery of orders is being seriously delayed by lack of railway transport facilities. I am advised that it is this lack of transport, and not the export trade, which is prejudicially affecting building operations in certain parts of the country.

Patent Rights and Renewal Fees.

Colonel Wedgwood asked the President of the Board of Trade whether his attention has been called to the case of holders of patents taken out before the war; whether he is aware that these holders have had to pay renewal fees during the war although they have not been allowed during the war

to manufacture the goods in respect of which the patents were granted; and whether it is proposed to extend the patent rights for a period to correspond with that during which they have been debarred from using them?

Sir A. Geddes: The proposals of the Government dealing with this matter are embodied in Clauses 6 and 7 of the Patents and Designs Bill, which is at present awaiting second reading in another place.

Quinine.

Mr. Spoor asked the President of the Board of Trade whether he is aware that the whole of the quinine (chinchona) production of the world, apart from the small quantity produced by the Government of India for local use, has lately been made the subject of a monopoly of the Dutch and British producers; whether he is aware that this monopoly is fortified, so far as this country is concerned, by an equally firm monopoly of the wholesale chemists of the United Kingdom; whether he realises that the consumer is now being charged 3s. 6d. per ounce, as compared with 1s., or even less, pre-war; and what steps he proposes to take to enable this commodity to be obtained without profiteering?

Mr. Bridgeman: The answer to the first part of the question is in the affirmative. The whole question of the prices and supply of quinine sulphate to this country is being investigated under Section 3 of the Profiteering Act, and I hope that the findings of the investigators will be ready for publication shortly.

Workmen's Compensation.

Major Baird, replying to Mr. Rose, said: My right hon. friend the Home Secretary hopes to be able to introduce very shortly a Bill to increase the amount payable under the Workmen's Compensation (War Addition) Act, 1917. The question of the permanent revision of the scales of compensation both in fatal and non-fatal cases must await the Report of the Departmental Committee on Workmen's Compensation, which is conducting a careful and thorough inquiry into the whole subject.

Importation of Matches.

Mr. A. Shaw asked the President of the Board of Trade whether any restrictions are in operation against the importation of Swedish or Belgian matches; and, if so, for what reason?

Sir A. Geddes: The importation of matches is not subject to any restriction.

Tinplate Prices.

Mr. Bridgeman, replying to Lieut.-Commander Chilcott on Tuesday, said: I am informed that the maximum price of tinplates when control ceased was 33s. 10½d. per box of 112 sheets (108lb.), f.o.r. at makers' works, and that the corresponding price at the present time is 41s. The desirability of instituting an inquiry into the price of tinplates is under consideration.

CORRESPONDENCE.

***We do not hold ourselves responsible for the opinions expressed by our correspondents.*

Ammonia and Alumina.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—In your last week's article, "Aluminium from Labradorite," I was delighted to note the research work accomplished by Professor V. M. Goldschmidt on the extraction of alumina from home raw materials—a subject which I, in common with others, have studied. The enforced abandonment by him of the method of extraction by sulphuric acid, then precipitation by ammonia, due to the great cost of the ammonia, reveals once more the great obstacle to scientific progress and cheap production that dear ammonia presents. The parent of all chemicals, we have been promised it at 2d. per lb.; it is still 1s. 10d.! Why? I may be wrong, but your article leads me to infer that the alumina obtained from labradorite is not free from soda, lime, and iron; and in Mr. J. T. Pattison's excellent little work on "Aluminium" I find the alumina obtained from bauxite is likewise contaminated with silica in addition. I know of no method for producing pure alumina from ferruginous materials, like fireclay, other than the one discarded by Professor Goldschmidt, and when Norwegian chemists succeed, as I believe they will, in producing "twopenny ammonia," the outcome will be impossible to realise.—Yours, etc.,

Burton-on-Trent, November 3, 1919.

A. E. TANNER.

LEGAL INTELLIGENCE.

Chemical Merchants' Bankruptcy Examination

Under the failure of Perry Mills and Co., export chemical merchants and agents, Capel House, 54, New Broad Street, E.C., and 67, Hanging Ditch, Manchester, Joseph A. H. Duke and Henry Slater, the partners at the date of the receiving order, attended before Mr. Registrar Mellor on Tuesday at the London Bankruptcy Court for public examination upon accounts showing gross liabilities £30,919. 17s. 4d. (unsecured £14,139. 18s. 11d.); assets estimated to produce £3,137. 7s. 10d.; and a deficiency reported at £11,002. 11s. 1d. The receiving order was made last August at the instance of the Nippon Shoko Company, Ltd., who claim £4,600. under a judgment in respect of an unfulfilled contract.

The debtor Duke was first examined, and in reply to Mr. Walter Boyle, Official Receiver, stated that prior to 1908 he acted as a clerk and half-commission man on the Stock Exchange. In that year he borrowed £2,000. from a friend to invest in the shares of a margarine company which he had assisted to promote, and of which he acted as director at a fee of £350. per annum. He had not reported that friend as a creditor under this bankruptcy, because he was his cousin, and had told him to regard the debt as forgiven. Witness knew nothing about the manufacture of margarine, and when the company went into compulsory liquidation in April, 1910, he found that he had lost £2,300. over the concern. In 1912 he assisted in the promotion of Oil Refiners, Ltd., which carried on business at Hammersmith as margarine manufacturers and oil refiners. He acted as joint manager and director at a fee of £700. per annum until July 31 last. That company was still carrying on a successful business. Whilst acting as director of the company, witness entered into partnership with Mr. R. D. Petty in the business of chemical agents at 29, Gracechurch Street, under the style of Perry Mills and Co. Neither partner put in any capital. They acted as manufacturers' agents for several German and other firms, who sent their accounts directly to and received payments from the customers. In 1913 they also became buying agents for home firms, and continued to act as selling agents for foreign firms. Witness and Mr. Petty continued the trade with considerable success. At the end of June, 1917, the accounts showed a surplus of £2,043. The partnership with Mr. Petty was dissolved in November, 1917, by mutual consent, the business being then solvent. The only partnership debt now outstanding was £600. due to Messrs. Schlinck and Co., of Hamburg, for goods supplied, and he had returned himself a debtor to that firm for his share of £300. He had notified the Public Trustee of the existence of that debt, and he agreed that it would have been better had they handed over the £600. to that official, and thus got rid of the liability some time ago.

On the retirement of Mr. Petty, witness was joined in partnership by Mr. Slater, who had acted as their manager for two years and three months. That gentleman brought in £700., and was given a half share of the business. During the whole time the business was carried on it was largely left to the management first of Mr. Petty, and subsequently of Mr. Slater, for the reason that witness's time was chiefly devoted to the affairs of Oil Refiners, Ltd. In November, 1918, witness joined the Department of the Ministry of Food, and was engaged in research work, for which services he received £300. per annum until he resigned the appointment in March, 1919.

The Manchester branch was opened in August, 1918. They employed a manager, expended £1,000. per annum on that branch, and in the result made heavy losses owing to mismanagement. The business was chiefly the export of chemicals (drugs, dyes, etc.) to the Continent, and as a rule they only purchased against orders received. The trading showed a profit down to the declaration of the Armistice in November, 1918. At the date of the Armistice they had paid for and shipped goods to the value of £13,654. to three Italian firms who had previously ordered the goods. They obtained an advance of £6,400. on the bills of lading from the Banca Commerciale Italiana, who informed them in January, 1919, that the bills had not been taken up, and upon their wiring to their customers they received replies to the effect that the Armistice had cancelled existing contracts. The real reason, however, doubtless was that in the meantime the markets had fallen, and the firms were waiting to see whether they would rise again. A portion of the goods had since been

realised by the Bank, who were returned by witness as creditors for £6,400., but hold three securities to the value of £4,770., leaving an unsecured balance of £1,630. They (debtors) instructed a solicitor at Genoa to take proceedings against the three customers, and a settlement was in course of negotiation.

The signing of the Armistice brought down prices all round, which placed them in a very awkward position, as they had entered into several large contracts with which to execute orders already obtained. After the end of May, when these bankruptcy proceedings were instituted, they did no business except for cash. The claim of the petitioning creditors was in respect of breach of contract for not taking up 50 tons of Japanese farina which witness ordered in October, 1918, to supply to a firm at Marseilles. The latter did not carry out the contract. The petitioning creditors, who invoiced the goods to witness's firm at £118. per ton, sold them at £29. 10s., and obtained a judgment for £4,600. last May. In consequence of these proceedings, witness severed his connection with Oil Refiners, Ltd. He attributed the failure of the firm to the default of the Italian customers to take delivery of the goods ordered by them and to the heavy fall in prices after the beginning of the Armistice.

The debtor Slater, having corroborated the evidence given by his partner, the sitting was adjourned till December 9 for the debtors to amend the statement of affairs by inserting certain claims which they disputed on the grounds that they were unjust and immoral.

T.N.T. Factory Explosion.

The case of the Holley Hill Rabb. and Chemical Company, Ltd., and the Royal Insurance Company, Ltd., and three other insurance companies, was mentioned in the Court of Appeal on Monday.

The case came before the court last month upon the appeal of the plaintiffs from a judgment of Mr. Justice Bailhache. The plaintiffs had erected premises at Ashton-under-Lyne in which they manufactured T.N.T., and the question in the arbitration which took place between the parties arose out of fire insurance policies effected on these premises with defendants. On June 13, 1917, a fire broke out on the premises which burnt fiercely for 20 minutes, and did great damage. Later an explosion took place which shattered the premises. A quantity of T.N.T. in closed receptacles was exposed to the intense heat of the conflagration, and this caused the explosion. The loss suffered by the assured up to the time of the explosion was assessed by the arbitrator at £12,740. The loss suffered by the assured through the fire and the explosion together amounted to a sum far in excess of the aggregate amount of the sum insured under the policies which had been issued to the assured by the insurance companies. The insurance companies admitted that they were liable to indemnify the assured for the loss suffered by them through the fire, but they contended that they were not liable under the policies for the loss which followed the explosion, on the ground that the conditions of the policies exempted them from that liability. Plaintiffs contended they were entitled under the policies to be indemnified not only for the loss caused by the fire, but also for the loss caused by the explosion, upon the ground that the explosion was an incident in the course of the fire, and that the proximate cause of the whole loss was the fire. The arbitrator and Mr. Justice Bailhache upheld the contention of the insurance companies, and the Court of Appeal on October 20 affirmed their decision, but directed that a further question affecting the Royal should be considered as to whether that company was estopped from relying on the true meaning of the policies legally construed by reason of certain statements by the agent of the Royal in two letters during the negotiations of the policies, and their lordships then decided that the appeal should stand over for a week for this point to be argued, unless the parties, in the meantime, could come to an agreement.

Mr. Douglas Hogg, K.C., now stated, on behalf of the plaintiffs, that the parties had now come to terms upon the point which had been reserved, and it had been decided that the order of Mr. Justice Bailhache as to costs against the plaintiffs and in favour of the Royal should be discharged, and, save to that extent, the appeal to be dismissed without costs to either side.

Mr. Keogh, for the Royal, agreed. He said that order only applied to the order as to costs against the Royal. Their lordships had already disposed of the appeal against the other respondents.

Soap Contract.

A claim for damages for alleged breach of contract to supply soap came before Mr. Justice Roche in the Commercial Court of the King's Bench Division on Monday. The action was brought by Mr. Robert Otto Wiener (trading as R. O. Wiener and Co.), of Water Lane, London, against G. A. Green (a partnership firm), of Commercial Street, London.

Plaintiff's case was that on May 15, 1919, defendants sold to him 4,350 cases of Sunlight soap, 72 x 12oz., delivery as to 350 on the following day, May 16, and as to 4,000 cases delivery before the end of the following week, at 60s. 6d. less 2½ per cent. gross, free delivered, wharf, London. Defendants delivered 350 cases, but had wholly failed and neglected, it was alleged, to deliver the balance of the cases. Plaintiff had suffered damage.

Defendants said that plaintiff bought 350 cases only of Sunlight soap, and they duly delivered the goods. By a separate verbal agreement on May 15, 1919, it was agreed that defendants would endeavour to obtain further supplies of the soap from Messrs. Lever Bros., and that provided they should be able to obtain delivery from Messrs. Lever Bros. the defendants would sell up to 4,000 further cases of the soap. Defendants denied that the delivery of the 350 cases was a delivery of part of a larger contract, as alleged. They were unable to obtain delivery from Messrs. Lever Bros. of any further cases of the soap, and were therefore under no obligation to make any further delivery to the plaintiff.

Evidence in support of the plaintiff's case was given by Mr. Robert Pintas, manager to the plaintiff.

Mr. John Dean, defendants' buyer and sales manager, denied that the defendants agreed to sell to the plaintiff 4,350 cases of Sunlight soap. Defendants' warehouse would not hold them; they would have to come from Port Sunlight. Witness had no authority on May 15 to make a future sale of Sunlight soap at a fixed price for delivery in a stated time.

Mr. J. A. Compston, K.C., on behalf of the defendants, said there was a conflict of testimony, but the balance of probabilities was absolutely against the plaintiff's case. What man in his senses on May 15 would have agreed to sell a large quantity of Sunlight soap at a fixed price for delivery on a fixed day, well knowing that when he got the soap from Lever Brothers it might be at a very largely increased price, because they knew the price did go up very appreciably in a short space of time, and well knowing that Lever Brothers reserved the right to cancel if there was a shortage of raw materials?

Mr. Justice Roche, in giving judgment, said he had come to a conclusion in favour of the defendants, and gave judgment for the defendants with the costs of the action.

Insurance of Nitrate Cargoes.

At the Liverpool Assizes on Friday, October 31, before Mr. Justice McCardie, an action was brought by Thomas Cheshire and Co. against Vaughan Brothers and Co. for negligence and breach of contract.

The action turned upon a dispute with regard to certain cargoes of nitrate of soda shipped from South America to this country, and intended to be stored in warehouses at Liverpool, Birkenhead, and Newport belonging to the plaintiffs. But owing to the war it was liable to be diverted by the Government to other ports on the Continent; and against this risk of diversion, by which the plaintiffs would lose on storage, as well as marine and war risks, the plaintiffs maintained that they instructed the defendants to effect certain insurances. When some of the vessels were diverted to Italy, and the underwriters refused to pay, the plaintiffs in the present action sued them and failed both in the High Court and on appeal. The plaintiffs now sued the defendants, contending that they had been guilty of negligence and breach of duty in not carrying out their instructions as to effecting an insurance which would have covered the risk of loss due to the diversion of the ships.

For the defence, it was claimed that the onus was upon the plaintiffs to prove that there was insurable interest in the adventure. This, it was held, had not been proved.

Giving judgment on Monday, his Lordship said that on the evidence of the plaintiffs he was satisfied that the defendants must be held guilty of negligence and breach of duty in not disclosing the actual risks and in not procuring a policy worded with the appropriate breadth *prima facie*, therefore judgment would be against the defendants; but two serious points were raised by defendants against that, the first being that the policy which they were requested to obtain was a

P.P.I. policy, which was void under Section 4 of the Marine Insurance Act of 1906, and therefore the plaintiffs could not recover thereunder; the second point was that plaintiffs had no insurable interest in the cargo or profits. These points were of a grave and general importance. His lordship held that plaintiffs were not entitled to recover the amount claimed, £1,800., or even nominal damages, and gave judgment for the defendants.

Libel Action by Director of Petroleum Executive.

In the King's Bench Division on October 30, before the Lord Chief Justice, a settlement was announced of a libel action brought by Sir John Cadman (director of the Petroleum Executive) against Mr. Lloyd Eastlake and his wife, Mrs. Evelyn Eastlake.

Mr. E. F. Spence, for plaintiff, said Sir John Cadman had, since about January, 1917, been a member of several Government Departments, formed for the purpose of obtaining oil. During this period there existed in these Departments two sharply opposed theories as to the best means of obtaining oil for the nation, plaintiff being the chief exponent for the one theory. The adherents of these respective theories became exceedingly bitter, and the result of this bitterness was that several newspaper attacks were made on plaintiff. Mrs. Eastlake, who during part of the period in question was a member of the staff of the Petroleum Executive, took at the time a very strong view of the conduct of plaintiff and his assistants, and the result was that she wrote three signed letters to him, containing serious charges against him. Between March 29, 1918, and January 20, 1918, eight anonymous letters were addressed respectively to the Secretary of the Admiralty (Mr. Walter Long), the editor of the *Oil News*, Sir Marcus Samuel, and Sir Charles Greenaway, in all of which serious and untruthful charges of misconduct and incompetence were made against plaintiff. Plaintiff and his advisers came to the conclusion that defendant was the author of these letters, and consequently brought this action for libel, in which the only defence was denial of authorship. The parties had come to terms. Plaintiff accepted defendant's assurance that she did not write the letters complained of, and defendants, in turn, recognised that plaintiff was not acting unreasonably in instituting proceedings. The terms included a full indemnity to plaintiff for his costs and the signing of an apology by defendant. Counsel therefore asked his lordship to stay the action upon these terms.

His lordship consented to the action standing out of the list on the terms agreed.

Damages for Non-delivery of Soda Ash.

In the Bow County Court, on Friday of last week, an action arising out of the non-delivery of 40 tons of soda ash was decided before Judge Graham, K.C. The plaintiffs were Messrs. V. L. North and Co., of 76, Finsbury Pavement, E.C., dealers in chemicals; and the defendants, Messrs. Senior Crozier and Company, Union Works, Union Street, Stratford, chemical manufacturers, the claim being for £63. 18s. 6d.

Mr. Medcalf, who appeared as counsel for the plaintiffs, said that the action had been remitted from the High Court. He understood that overtures had been made by the other side for settlement, and a figure having been arrived at, they were agreeable for judgment to be entered for that amount. Of the sum claimed £33. 18s. 6d. represented the balance due for goods sold and delivered, and £30. was a sum agreed upon as damages for the defendants failing to deliver 40 tons of soda ash at the docks by an agreed date, causing the plaintiffs to have to go into the open market and purchase at a higher figure. The order was placed on March 12 for delivery on March 25, but it was not carried out. A sum of £18. 18s. 6d. had been paid into court, and the agreed balance was £45. He might say these transactions had been going on for years and years between the parties, and this was simply an unfortunate happening.

Judge Graham entered judgment for the plaintiffs for £45. and costs.

Customs Seizure of Pyrogallic Acid.

In the King's Bench Division on Tuesday, before Mr. Justice Sankey, Mr. R. A. Wright, K.C., applied in the case of the Attorney-General v. Brown and Forth, chemical merchants and importers of Farringdon-street, London, and Manchester, to fix a date for the hearing of an information on the Revenue side of the King's Bench Division.

His Lordship said he would fix the hearing for November 18.

REPORTS OF COMPANIES.

Alby United Carbide Factories, Ltd.

The report for the period ended December 31, 1918, states that the net profit (after writing off over £34,000 for depreciation of buildings, plant, ships, etc.), amounts to £26,596, and £14,132, was brought in, making £39,728. Dividend on 5½ per cent. preference shares, less tax, £1,959; dividend of 6 per cent. on ordinary shares, less tax, paid February 3, 1919, £27,381; carried forward, £6,837. During the period covered by the accounts the adverse exchange was again a serious factor; owing to continued war conditions great difficulty was also again experienced in keeping the works supplied with the necessary raw materials and in maintaining adequate labour. From North Western Cyanamide Co., Ltd., a dividend of 15 per cent. and from Nitrogen Products and Carbide Co., Ltd., a dividend of 9 per cent. have been received. The dividend received from A/S Meraker is somewhat lower than that for the previous twelve months.

At an extraordinary meeting of the Alby United Carbide Factories, to be held in London on Tuesday next, the scheme for the amalgamation of the company and Nitrogen Products and Carbide Company, Ltd., will be submitted to the shareholders for approval. In the circular calling the meeting it is stated that: "Nitrogen Products, through shareholdings, is the proprietor of the cyanamide works at Odda (Norway), to which, under contract, the Alby Company supplies a very large proportion of its output of carbide. In normal times such an assured annual sale was a very valuable factor in relation to the cost of production, but the conditions brought about by the war have so altered circumstances that certain clauses of the contract have become not only harsh and unjust, but also, the directors are advised, practically unenforceable. As a consequence, difficulties have been created that would disappear under the proposed scheme, and the Alby directors are, therefore, of opinion that interests would be best served by an amalgamation with the company owning the cyanamide factory. By adopting this course it is stated that the company should be able to take immediate advantage of any variation in the demand for its products, and so divert its output to whatever channel promises the more remunerative return. The directors feel confident that by the amalgamation the position of both companies will be greatly strengthened, and the dividend earning capacity of the combined enterprises materially increased."

"In the event of the shareholders approving the amalgamation, it is proposed to capitalise and distribute a portion of Alby United's accumulated reserve by allotting to each shareholder of Alby United, and paying up on his behalf, one additional ordinary £1. share for every eight ordinary shares held. For that purpose, and for the purpose of providing the shares to be received by the shareholders of Nitrogen Products, it is proposed to increase the capital of Alby United to £2,332,916 by the creation of 1,607,916 new ordinary shares of £1. each, ranking *pari passu* with the existing ordinary shares. In the event of the shareholders of both companies passing the necessary resolutions, Nitrogen Products will go into voluntary liquidation and its assets and liabilities will be taken over by Alby United, which will give in exchange one fully-paid new ordinary £1. share in Alby United for every similar share held in Nitrogen Products. Alby United, as the holder of 500,035 fully-paid shares of Nitrogen Products, will not claim any allotment of shares. As a result of the amalgamation, the boards of the two companies will be combined, but, as the shareholders know, six of the present directors of Alby United are members of the board of Nitrogen Products."

Nitrogen Products and Carbide Company, Ltd.

The report to December 31, 1918, states that the profit for the year, subject to excess profit duty (if any), amounts to £188,814., and £24,049. was brought in, making £142,863. A dividend of 9 per cent., less tax, was paid on February 3 last, absorbing £118,467., and there has been transferred to reserve for contingencies £10,000., leaving to be carried forward £14,396. The factory at Odda worked continuously, but the maximum output was not reached, as it was impossible to maintain supplies of raw materials, owing to the conditions incidental to the war. A ready market was assured for all the cyanamide manufactured, the bulk of which was utilised in the manufacture of explosives for the Allies. Work on the Aura water power scheme was continued on a limited scale, and will be proceeded with more energetically as soon as con-

ditions are again normal. Whilst hostilities continued, large quantities of nitric acid were produced at the works in France, where the company's catalytic process was employed, and £50,000 has accrued by way of royalty.

Production of ammonium nitrate at Dagenham was rendered unprofitable, owing to the fact that the plant was intended to deal with cyanamide as the base of the ammonia supply, and that on account of the conditions brought about by the war the importation of cyanamide became impracticable. In order to discharge the contract and carry out the contract and provide the Government with such a vital product as ammonium nitrate, recourse was had to gas liquor. The latter was found not to lend itself to satisfactory treatment by the plant as then installed; but we continued working, although at a great disadvantage. The Toker water rights have been sold to the Norwegian Government for a sum of £29,518 in excess of the figure at which that asset stood in the balance-sheet.

Oilfields of England, Ltd.

The statutory general meeting was held on October 30, in London, Mr. William Ivey, presiding. The Chairman said that the statement of accounts presented was quite satisfactory. Theirs was the first British company formed in Great Britain to bore for oil in Great Britain itself, though millions of money had been raised in Great Britain for the development of oilfields abroad. The company had the honour of holding the first British licence granted by the British Government for that purpose, and he trusted they would also be the first to prove that oil existed in commercial quantities. With regard to the prospects of the company, he saw nothing to alter the views held out in the prospectus. The company's future was speculative, but only as regarded the amount of oil they would get. They knew beyond the shadow of a doubt that oil existed on the Kelham estate, and the only thing they had to prove was whether there was sufficient oil to pay a dividend, and by sufficient oil he meant whether it was a commercial proposition. On that point he could not tell the shareholders anything more than they were told three months ago. With regard to the subject of oil generally, his opinion was that oil had not been appreciated at its true value. He would take the responsibility of saying that he did not think even oilmen appreciated the potential value of a barrel of oil. They had heard much about the misuse and waste of coal, but worse than the misuse and waste of coal were the waste and misuse of oil. He believed the day would come when it would be proved beyond a doubt that the essential component parts of a barrel of crude oil contained more power, more wealth, than any other commodity of commercial value in the world. He thought the Government should assist in the matter of laboratory research to prove the real value of a barrel of oil. The Germans proved years ago beyond a doubt that hundreds of thousands of pounds could be usefully and beneficially spent in the laboratory. In this country we late in life had discovered that too, and in the matter of aniline dyes and other products we were trying to make up for lost ground. He believed that contained in a barrel of oil were such properties, such powers, medicinal, economical, and mechanical, as would absolutely bar it from ever being used as crude oil in its present condition.

Langdale's Chemical Manure Company, Ltd.

The directors, in their report for the year to September 30 last, state that the forward outlook for the manure trade is hopeful in the immediate future, and they only wait for a more plentiful supply of raw material to enable the trade to develop again. The Irish trade has been given up, and the Government forbid any export trade abroad. The profit for the year is £6,918., and £3,643. was brought in, making £10,561. The directors propose to pay a dividend of 5 per cent., free of tax, for the year 1919, and a final dividend of 2 per cent., free of tax, for the year 1918, leaving to be carried forward £2,931., subject to excess profits duty and income-tax.

Alexander Fergusson and Company, Ltd.

Report to September 30 last states that the year's trading has resulted in the profit—after providing for all charges, including managing directors' salaries, directors' fees and provision for excess-profits duty and contingencies of £16,173., which, with £6,636 brought in, makes £22,809. There has been applied in depreciation of property, plant, machinery, etc., £4,000., and transferred to reserve fund £3,500. The directors recommend a final dividend on preference at rate of 5

per cent. p.a., less tax, and dividend on "A" and "B" ordinary at rate of 12½ per cent p.a., less tax, leaving to be carried forward £6,134.

Loders and Nucoline, Ltd.

A proposal has been received for the acquisition of the holdings of the shareholders in Loders and Nucoline, Ltd., on terms which the directors consider are advantageous to the shareholders. So soon as terms are definitely arranged a further communication will be issued.

DIVIDENDS.

BRITISH OXYGEN COMPANY.—Interim dividend of 5 per cent. (1s. per share), free of income-tax, on the ordinary shares.

BORAX CONSOLIDATED LTD.—Interim dividend of 1s. per share, less tax, on deferred ordinary in respect of year ending September 30, 1919.

BRUNNER, MOND AND CO., LTD.—Interim dividend for the six months ended September 30 at the rate of 10 per cent. per annum, less tax. The dividend is the same as that of the corresponding period last year.

NEW COMPANIES.

British Sugar Refiners' Association.—Registered as a company limited by guarantee, without share capital, having an initial number of members not exceeding 100, each liable for one guinea in the event of winding up. Objects: To promote and protect the commercial interests of British sugar refiners, to define trade usages and customers, etc. Registered office: 5, London Wall Buildings, E.C.

Lewis and Peat, Ltd.—Capital £500,000., £1. shares. Object: To take over the business of produce brokers carried on as "Lewis and Peat." Registered office: 6, Mincing Lane, E.C.

Turner's Glass Works Company, Ltd.—Capital £50,000., £1. shares (30,000 7 per cent. preference). Registered office: Carlton Road, Worktop.

Albert Dumont and Co., Ltd.—Private company. Capital £1,000., £10. shares. Tallow merchants, tanners, drysalers, importers, and manufacturers of and dealers in oils, fats, paints, varnishes, etc., in Great Britain, Russia, or elsewhere. Registered office: 14, Copthall Avenue, E.C.

Canbee, Ltd.—Private company. Capital £1,000., £1. shares. Sheet-metal and tinplate workers, manufacturers of and dealers in tin, iron, copper, and enamelled wire, etc. Registered office: 584A, High Road, Leytonstone

Cattle Cake Company, Ltd.—Private company. Capital £25,000., 1s. shares. As title Agreement with the Tregaron Peat Company, Ltd. Solicitor: G. H. Barchard, 22, College Hill, E.C.

Chemical and Commercial Trust, Ltd.—Private company. Capital £25,000., in 20,000 ordinary shares of £1. each and 100,000 deferred shares of 1s. each. Manufacturing and analytical chemists, etc. Registered office: 41, Finsbury Square, E.C.

General Mining Company, Cornwall, Ltd.—Private company. Capital £25,000., £1. shares (10,000 preferred). Copper, zinc, lead, tin, wolfram, and general miners, etc. Registered office: 7-8, Lilypot Lane, E.C. 2.

Holder and Son, Ltd.—Private company. Capital £3,000., £1. shares. Pharmaceutical, analytical, manufacturing, or consulting chemists, etc. Registered office: Wellington Chambers, 46, Cannon Street, E.C. 4.

John C. Van der Taelen, Ltd.—Private company. Capital £25,000., £1. shares. Object: To take over the business of a rubber merchant formerly carried on by J. C. Van der Taelen as "John C. van der Taelen," at 37, Mincing Lane, E.C.

John J. Bowater, Ltd.—Private company. Capital £20,000., £1. shares. Object: To take over the business carried on by J. J. Bowater at West Bromwich. Oil and colourmen, merchants, importers and manufacturers of and dealers in oils, paints, etc.

P.E.T. Syndicate, Ltd.—Private company. Capital £20,000., £1. shares. Extractors, purifiers of and dealers in petroleum and other mineral oils, etc. Solicitors: Wreford Brown, Hewel and Co., 38, Old Jewry, E.C. 2.

Scientific Instrument Makers, Ltd.—Private company. Capital £6,000., £1. shares (3,000 12 per cent. preference). Wholesale or retail scientific glass instrument makers, metal workers, coppersmiths, glass blowers, etc. Registered office: 47-8, Langburn Chambers, Fenchurch Street, E.C.

Q-Ozone Processes, Ltd.—Private company. Capital £10,000., £1. shares. Object: To acquire and deal with certain patents and rights relating to the use of ozone and chemical processes for various electrical, chemical, metallurgical, and commercial applications, etc. Solicitor: F. A. C. Redden, 17, Victoria Street, S.W.

Mersey Paint Works, Ltd.—Private company. Capital £100,000., £1. shares (40,000 preference). Object: To take over the business of paint, colour, ships' composition and varnish manufacturers, oil boilers and refiners, etc., carried on by J. and W. Wilson, Ltd., at Liverpool. Registered office: 31, Wapping, Liverpool.

Parry Pure Drug Company, Ltd.—Private company. Capital £5,000., £1. shares. Registered office: 10, Adam Street, Adelphi, W.C. 2.

Organic Research Company, Ltd.—Private company. Capital £21,000., in 20,000 ordinary shares of £1. each and 20,000 founders' shares of 1s. each. Research work for the purpose of proving and developing certain patents referred to in an agreement between C. Weizmann, W. A. Bromwich, and the company, and for the discovery and development of new inventions and processes relating to organic solvents, etc. Office: 10A, Featherstone Buildings, Holborn, W.C.

Technogor Mining and Engineering Trading Company (England), Ltd.—Private company. Capital £25,000., £1. shares. Object: To acquire any mines, rights, oil wells, oil-producing and metalliferous land in the U.K. or elsewhere. Office: 98, Gt. Tower Street, E.C.

Townmead Oil Works, Ltd.—Private company. Capital £100,000., £1. shares. Seed importers, exporters, crushers, extractors, and merchants, oil merchants, refiners, and hardeners, etc. Office: Townmead Road, Fulham, S.W.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence further information may be obtained:—

Australia.

A manufacturers' agent in Sydney desires to secure the representation, in Australia, of United Kingdom manufacturers of chemicals in bulk. (Reference No. 912.)

British India.

A manufacturers' travelling representative desires to represent British manufacturers of soap and candles. (Reference No. 915.)

New Zealand.

A Dunedin firm of general merchants desire to secure the representation, for the Dominion, of United Kingdom manufacturers of linseed oil and white lead, and lubricating oils and greases. (Reference No. 941.)

South Africa.

A member of a Johannesburg firm, who is at present in this country, desires to get into touch with United Kingdom suppliers of superphosphates and heavy chemicals for industrial purposes. (Reference No. 944.)

Spain.

H.M. Consul, Malaga, reports that a Spanish firm in that town desire to secure an agency, for the whole of Spain, for chemical fertilisers, for which the applicant states there is a great demand. (Reference No. 969.)

The Acting Consul-General, Seville, reports that a Spanish doctor of that town desires to obtain an agency for a British firm dealing in chemicals. (Reference No. 970.)

Greece.

A general commission agent established in Athens is desirous of representing in that city United Kingdom firms dealing in chemicals. (Reference No. 959.)

Netherlands.

A Dutch importer at Tilburg wishes to be put into touch with a United Kingdom manufacturer of tanning extracts. (Reference No. 961.)

Norway.

A Stavanger firm desires to represent British manufacturers and exporters of paints and oils. (Reference No. 962.)

Algeria.

A business man in Oran, Algeria, wishes to act as agent for British manufacturers of soap and mineral and vegetable oils. (Reference No. 972.)

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

October 27th to November 1st (inclusive).

- Phenolic Condensation Products. Alger, H. P. 26,403.
 Treating Coal Tar, etc. Anderson, W. 26,759.
 Separating and Powdering Minerals. Ann, A. E. 26,704.
 Production of Aluminium Nitride, etc., by Electrically Generated Heat. Armour Fertiliser Works. 26,332.
 Fertiliser. Baker, W. B.; and Shepherd, M. C. 26,780.
 Drying and Distilling Apparatus. Benton, W. A. 26,462.
 Diethyl Sulphate. Boake, Roberts, and Co., A.; and Plant, S. G. P. 26,700.
 Manufacture of Mercuric Oxide, etc., by Decomposition of Nitrates. Borelli and Co., Dr. V.; and Brusa, G. 26,740.
 Dyeing or Colouring Fibres, Threads, or Fabrics. British Cellulose and Chemical Manufacturing Co.; Briggs, J. F.; and Palmer, C. W. 26,801.
 Automatic and Continuous Analysis and Recording of Gases. Brown, W. D. R.; and Pickston, W. T. 26,640.
 Recovery of Selenium and Noble Metals from Electrolytic Slimes, etc. Chikashige, M.; and Uno, D. 26,470.
 Rotating Colour Mixing or Blending Devices. Clifton, W. E.; and Ewart, J. S. 26,888.
 Obtaining Copper from Lyes Resulting from Treatment of Cupriferosus Pyrites. Cottineau, H. P. Soulié 26,819.
 Vapour-condensation Plant. Crush, E. H. 26,453.
 Manufacture of Rubber. Davidson, S. C. 26,735.
 Heat-insulating Composition. Dyring, I. T. 26,504.
 Phenolic Condensation Products. Froom H. 26,403.
 Composition Impervious to Oils, Spirits, Water, etc. Ivinston, C. H.; and Roberts, G. S. 26,426.
 Anti-corrosive Paint or Composition. Ivinston, C. H.; and Roberts, G. S. 26,427.
 Paint-distemper. Leach, P. 26,293.
 Carbonisation and Distillation of Moist Carbonaceous Materials. McLeod, H. N. 26,833.
 Igniting-composition for Matches. Mellgren, O. J. 26,827.
 Leaching and Separation of Ore. Middlemiss, E. T. 26,530.
 Extraction of Ammonia from Gases, etc. Pease, E. L. 26,589.
 Electric Furnaces. Redmayne, W. 26,663.
 Apparatus for Mixing Pigments or Colours. Smith, E. 26,782.
 Apparatus for Slaking Lime. Spoerri and Co. 26,354.
 Refining Arsenious Acid. Uchino, M. 26,317.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25 Southampton Buildings, Chancery Lane, W.C.

1914.

- Manufacture of Salts or Compounds of Choline and of Its Higher Homologues. Johnson (Vereingte Chemische Werke Akt.-Ges.). 8,031.
 Apparatus for Use in Obtaining China Clay. Nalder. 14,788.

1918.

- Ferro-tungsten and Other Tungsten Alloys. Blackwell, H. A. 12,363.
 133,981
 Production of Paraffin Waxes, Oils, or Fats from Peat, and the Like. Porat, K. H. V. von. 15,357.
 133,989
 Manufacture of Glue and Similar Materials. Mumford, R. W. 17,185.
 134,011
 Apparatus for Producing Sulphuric Acid. Welch, H. V. 17,226.
 134,015
 Dry Distillation with Strong Bases in the Presence of Steam of the Waste Liquors of the Cellulose Manufacture or Other Similar Waste Liquors. Rinman, E. L. 17,718.
 120,724
 Apparatus with Horizontal Diaphragm for Electrolysis of Alkaline Chlorides. Norsk Alkali Aktieselskabet. 18,702.
 125,935
 Heat Treatment of Chemical Compounds. Covers, F. X. 19,271.
 129,962

1919

- Manufacture of Acetone and Carbonic Acid. Soc. Anon. des Acieries and Forges de Firminy. 4,019.
 134,144
 Treating Spathic Iron Ore to Render it Suitable for Use in the Manufacture of Hydrogen. Bates, W. J.; and Bates, W. R. 6,051.
 134,155
 Centrifugal Separating-machines. Sturgeon, R. A. 6,611.
 134,158
 Connecting of New, or Repairing of Broken, Lead or Other Soft Metal Pipes. Sprague, W. 11,281.
 134,171
 Bhalogenethylaminobenzoic esters. Soc. Chimique des Usines du Rhone. 13,761.
 128,553
 Balkylaminoethylaminobenzoic alkyl esters. Soc. Chimique des Usines du Rhone. 13,762.
 128,554
 New Substituted Benzoic Acid Esters. Soc. Chimique des Usines du Rhone. 14,550.
 128,912

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1919.

- Manufacture of Alkaloids. Chimische Fabrik vorm. Sandoz. 20,223.
 134,197
 Effecting Crystallisation from Solution. Norsk Hydro-Elektrisk Kvaestofaktieselskab. 25,013.
 134,207
 Process of Making Sodium Salts. Salzwerk Heilbronn. 25,676.
 134,214

Water-soluble and Water-emulsible Substances. Melamid, M.; and Grotzinger, L. 25,932.
 134,223
 Filters. De Haen Chemische Fabrik List, E. 26,045.
 134,228
 Synthesis of Nitric Acid. Mage, L. A. 26,135.
 134,229

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Pigments. J. F. Duke, Shortlands, Kent. British Patent, 131,769, of 1918.

A black pigment suitable for printers' ink, boot polish, etc., is prepared by treating starch, cornflour, dextrine, or other carbohydrate with tannic or other acid and perchloride or other salt of iron. For example, to 80 parts by volume of boiling water 20 parts by volume of the carbohydrate are added, the carbohydrate being previously mixed with part of the water. With 1,000 volumes of the solution thus obtained are thoroughly mixed five volumes of tannic acid, and finally two volumes of iron perchloride solution of 50 per cent. strength, whereupon the black pigment is immediately produced. The above proportions may be varied in different purposes, but the proportion of carbohydrate should not be varied by more than 10 per cent.

Cyanides. N. Testrup and Techno-Chemical Laboratories, Ltd., London. British Patent, 131,964, of 1918.

In the production of cyanides such as barium cyanide, by spraying a mixture of powdered carbon and a metal compound into a heated atmosphere containing nitrogen and enough oxygen to burn the excess of carbon to carbon monoxide, the reaction product is received upon a layer of finely-divided material forming a moving bottom to the reaction chamber. The apparatus is of the type described in Specifications 115,087, 129,758, and 129,771. A shallow reaction chamber *a* has a hollow box-like bottom *c* with extensions *c*¹ and *c*², the latter being perforated to act as a sieve. A layer of reaction substance, or inert material covered by reaction substance, or inert material alone is spread

by scrapers on an endless conveyer *e*, the lower portion of which passes over the surface *f* at the bottom of the apparatus. The air enters the box *c* at *c*¹ and passes out at *c*² and thence through passages *g*, *g*¹, *g*², *g*³ to the inlet *g*¹ of the reaction chamber, where it meets a stream of powdered barium carbonate and carbon from a hopper *m*. The gaseous products escape by a path *h*¹, *h*², *h*³, *h*⁴ so as to heat the incoming air. The powdered material forming the moving bottom is supplied from a hopper *d* and falls through the sieve *c*² and is returned to the hopper *d* by the lower portion of the conveyer *e* and by the conveyer *j*, while the barium cyanide passes over the sieve *c*² and is received in a hopper *k*.

Organic Acid Anhydrides and Chlorides. T. H. Durrans, Oxford; and A. Boake, Roberts and Co., Stratford, London. British Patent, 131,379, of 1918.

Organic acid anhydrides other than acetic anhydride are prepared by mixing anhydrous organic salts of the alkali or alkaline earth metals with phosphorus and treating the mixture with chlorine, the materials being used in the proportions of 6 to 8 molecular parts of alkali salt (or 3 to 4 of alkaline earth salt) to 1 atomic part of phosphorus and 3 to 5 atomic parts of chlorine; the products are isolated by distillation or by extraction with a solvent such as carbon tetrachloride. The preparation of phenylacetic anhydride is described in an example; butyric anhydride is also specified. Organic acid chlorides other than acetyl chloride are prepared similarly, but using the reagents in the proportions of 3 to 4 molecular parts of alkali salt (or 1½ to 2 molecular parts of

alkaline earth salt) to 1 atomic part of phosphorus and 3 to 5 atomic parts of chlorine; the products are isolated by distillation or by extraction with a solvent. The preparation of benzoyl chloride is described in an example; propionyl chloride also is specified.

Chromium Salts. J. R. Blockey and W. Walker and Sons, Bolton. British Patent, 131,772, of 1918.

Chrome liquors and salts for use in tanning are made by acidulating bichromate with sulphuric or hydrochloric acid, and reducing the compound so as to obtain trivalent salts by the addition of waste tannery products such as spent tanning materials, waste chrome or vegetable leather, waste sludge from tan pits, either wet or dry, or the dust from tanning material extraction plant.

Removing Paint. Q. Marino, Hendon, London. British Patent, 131,709, of 1918.

Rust, paint, varnish, or grease is removed from iron and steel and paint, varnish, grease, oxide, or sulphide from copper by an electrolytic process, the electrolyte being a solution of caustic soda or potash of 12°-20° Bé. to which is added crystallised oxalic acid and sulphate of soda, potash, or magnesium. The electrolysis is carried out in iron vats at 90 to 100° C., the anode being iron or carbon and the cathode the article to be cleared. The current employed is 80-100 amperes per sq. foot at a voltage of 4-5 volts. The paint, varnish, or grease may be partly removed before carrying out the process by dipping the article in caustic soda.

Electrolytic Pickling of Metals. I. Jascowitz and J. Rosenbaum, London. British Patent, 131,455, of 1918.

An electrolyte consists of a solution of spent caustic melt, obtained in the manufacture of β -naphthol, phenol, alizarine, resorcin, etc., and consisting of caustic soda, sodium sulphite, sulphate, and carbonate, and a little phenolate or the like. Alternately, a prepared solution of similar composition may be used. The electrolyte may be heated to 90° C. The articles form cathodes.

Glycols. C. Weizmann, Kensington, London; and E. G. Bainbridge, Ashton-under-Lyne. British Patent, 131,628, of 1918.

Glycols are prepared by heating dichlorparaffins in aqueous suspension under pressure at 100-200° C. with aluminium hydroxide, chalk, lead carbonate, or borax, or by heating the dichlorparaffins with sodium bicarbonate alone under pressure at 100-200° C. Examples are given of the treatment of a mixture of 1 : 3 - and 1 : 2 - dichlorbutane prepared by passing chlorine into butyl chloride vapour and fractionating the product.

Removing Sodium Sulphate from Solutions. F. A. Freeth, Sandiway, Cheshire; and H. E. Cocksedge, Herne Hill, London. British Patent, 131,956, of 1918.

Sodium sulphate is removed from solution by treatment with calcium sulphate or a salt from which calcium sulphate is produced in the solution, such as calcium chloride or nitrate, the double salt $\text{CaSO}_4 \cdot \text{Na}_2\text{SO}_4$ being formed and separated. The double salt may be decomposed into its constituents by digesting with water.

Hydrogen and Nitrogen. J. Harger, Gateacre, Lancashire; and Lever Bros., Port Sunlight, Cheshire. British Patent, 131,684, of 1918.

In the manufacture of hydrogen by passing steam over heated iron, alternated by the reduction of the iron oxide obtained, copper oxide, or other suitable metallic oxide, is used in close proximity to the iron for the purpose of obtaining regenerative heating effects by combustion of the residue of "spent" reducing gas, and also alternately, by oxidation of the reduced copper by air or oxygen. In addition, nitrogen and carbon dioxide are produced by the use of gas mixtures containing air, water gas, producer gas, etc. The iron and the copper oxide may be placed in a number of small tubes which run through a larger pipe containing the iron. Preferably the copper oxide is prepared in a porous condition by mixing the oxide or carbonate or oxalate with kieselguhr, clay, or other binding material, moulding into bricks, with or without perforations, drying, and baking. Soluble salts such as the

nitrate may also be mixed with clay, kieselguhr, etc. In carrying out the main process, a composite mass containing both the iron and the copper material—e.g., in bricks made in two portions—may be interposed between the principal masses of the iron and copper materials.

Nitrogen Oxides. J. R. Partington, Lostock Gralam, Cheshire; and E. K. Rideal, London. British Patent, 131,942, of 1918.

In the catalytic oxidation of ammonia, more oxygen is employed than would be sufficient to produce nitric oxide only, and the product is cooled to 30° C. in not more than 30 seconds to separate water before the nitric oxide has had time to oxidise further. The hot gases may be passed into a tower *a*, Fig. 1, which may be externally cooled by water, the gases

entering by a tangential pipe *b*. Additional air may be admitted by another tangential pipe *c*. Alternatively the gases from the catalytic apparatus *f*, Fig. 3, may be passed through cooling-tubes *g* and a worm *h* in a tank *i*. In either case, condensed water collects in a tube *d* and is drawn off by a valve *e*.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Sodium Hydrate. Dorr Company, New York, U.S.A. British Patent, 131,272. Convention date, August 16, 1918.

Sodium hydrate is made by treating soda ash—obtained, for example, by evaporating and calcining the spent liquor from pulp digesters—with freshly slaked lime, or unslaked lime and a liquid lime-slaking medium, in a closed circuit grinding system, and separating the resulting solution of sodium hydrate. In the apparatus shown, soda ash, obtained from the spent liquors from pulp digesters 1, is conveyed to a bin 2, and is fed, together with lime from a bin 3 and fresh soda ash, to replace waste, from a bin 4, to a grinding mill 5 supplied with water or other lime-slaking medium—for example, wash-water or a solution of sodium carbonate or hydrate. The dis-

charge from the mill passes to a classifier 6, which returns the insufficiently ground material to the mill 5, the sufficiently ground material accumulating as a slime in a sump from which it is conveyed to a series of reaction vessels 7 heated to about 95° C. and provided with agitating means. The resulting solution of sodium hydrate is separated from the calcium carbonate mud by decantation in vessels 8, 9, 10. The sodium hydrate solution overflowing from the vessel 8 is conveyed to a storage vessel 11 connected to the digesters 1. The residue from the vessel 8, after being mixed with the wash-water from the vessel 10, is pumped into the second vessel 9, the overflow from which may be used as the lime-

slaking medium or as a diluent for the material discharged from the classifier into the reaction vessels. The residue from the vessels 9 is pumped into the vessel 10 after mixing with fresh water, and the residual mud is conveyed away for further treatment. More than three decantation vessels may be employed.

Dinitrophenol. T. J. Brewster, Perth Amboy, New Jersey, U.S.A. British Patent, 131,403. Convention date, November 20, 1917.

Dinitrophenol is prepared by treating benzene at 50-60° C. with nitric acid of 45-55 per cent. strength in the presence of a mercury compound, further nitration to picric acid being avoided by continuously or intermittently withdrawing the liquid reaction mixture, cooling it to crystallise out the dinitrophenol, filtering off the crystals, and returning the filtrate to the reaction chamber. Silver nitrate may be used in conjunction with the mercury. Using the apparatus shown, the nitrator 1 is charged with nitric acid of 50 per cent. strength containing dissolved mercury, the charge is brought to 70° C. and a proportion of benzene is run in from tank 31. The hot acid liquor is pumped through a cooler 12, the crystallised dinitrophenol is separated in the filter 15, and the filtered

liquor passes back to the nitrator by pipe 17. A portion of the acid is diverted by pipe 18 through tank 19 to a concentrator 20, and the concentrated acid then passes back to the nitrator by pipe 21. The benzene vapours and nitrogen oxides evolved in the nitration pass to a cooler 6, where the benzene condenses and flows back to vessel 1, while the nitrogen oxides pass on to a tower 9 where they are reoxidised by air to nitric acid. Fumes from the concentrator 20 similarly pass to a cooler 24 where weak acid condenses, while uncondensed fumes pass on by pipe 26 to the tower 9. Fresh nitric acid and benzene are supplied as required from tanks 27, 30. Any dinitrophenol collecting in the cooler 12 may be removed by circulating benzene from tank 31 therethrough at intervals, such benzene containing dissolved dinitrophenol being then sent into the nitrator.

Nitro-compounds. F. Gros and Bouchardy and L. J. J. Perruche, Paris. British Patent, 131,982. Convention date, September 24, 1917.

Aromatic compounds are nitrated by passing oxygen or ozonised air, or air under pressure, into a well-cooled mixture of the compound with liquid nitrogen peroxide and traces of water. The product may be worked up by distilling off the excess nitrogen peroxide and separating the nitro-body from nitric acid, or the mixture of nitro-body and nitric acid may be heated with sulphuric acid to give polynitro-bodies. The body treated may be dissolved in an inert solvent—e.g., carbon tetrachloride. Examples are given of the nitration of benzene and anisol.

Electrolytic Production of Zinc Salts. Electrolytic Zinc Co. of Australasia Proprietary, Melbourne. British Patent, 131,702. Convention date, August 17, 1917.

Before electro-deposition of zinc, the electrolyte, which may be obtained by leaching ores with sulphuric acid, is freed from cobalt by addition of arsenic and treatment with zinc dust. Arsenious acid or sodium arsenite may, for instance, be added

to the solution, or arsenic ores or calcines to the unroasted or roasted zinc ore. A copper compound such as the sulphate is also added if sufficient copper is not already present. The treatment is best effected with the solution slightly acid, and at 60° C. Addition of the zinc dust is preferably made in stages, the first addition being sufficient to precipitate copper, cadmium, and arsenic; the second to remove most of the cobalt; and the third to complete and preserve the purification. After each addition, the solution is agitated with as little access of air as possible. Before treatment, iron is precipitated by limestone.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The condition of the hematite pig-iron trade is not such as to offer any hope at present of an improvement in the Cumberland coking and by-product trade. It is due, of course, to the dulness of the demand for ordinary iron that the Cumberland by-product ovens, with the exception of two of the plants, are not working at more than a third of their capacity. Even requirements of low phosphorus iron are now falling off, and when that takes place the ordinary iron trade is not as a rule in a healthy condition. Makers are resigned, however, to a continuance of the existing unsatisfactory position so long as there is no settlement of the iron moulders' strike. But for the persistency with which some people who believe in a boom in the iron trade in the spring, and have accordingly been stocking, the situation now confronting makers would have been reached some weeks ago. It is evident that things may have to grow worse before they become better. The make of by-products is being fairly well disposed of. Benzole and sulphate of ammonia find a ready market, and pitch is moving away freely, a good deal of it being exported to Spain. Creosote is also in fair request.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

China Clay Corporation, Ltd., London, E.C.—F. F. Fuller, 638, Salisbury House, London Wall, E.C., appointed receiver October 17.

New Sulphosa Salt Company, Ltd.—Claims to T. F. Wild, 22-28, Broad Street Avenue, E.C., liquidator.

Surrey Fullers Earth Company, Ltd.—Resolved October 1, confirmed October 21: That the company be wound up. H. Kaye, Hill Crest, Beaumont Park Road, Huddersfield, liquidator. That in winding up the company the liquidator carry out the terms contained in agreement dated September 25 between the company of the first part, the shareholders of such company of the second part, and Fullers Earth Union, Ltd., of the third part. Meeting of creditors at office of liquidator, Aspley Place, Huddersfield, November 10, at 11 a.m.

Wear Portland Cement Company, Ltd.—Meeting of creditors, 26, John Street, Sunderland, November 3. Claims to H. S. Squance, 26, John Street, Sunderland, liquidator, forthwith.

COMING EVENTS.

Society of Chemical Industry: Birmingham and Midland Section.—Meeting will be held jointly with the Birmingham Metallurgical Society in the University Buildings, Edmund Street, Birmingham, at 7 p.m. on **Thursday, November 13.** Paper: "Production of Artificial Abrasives in the Electrical Furnace," by C. J. Brockbank, of Thorold, Ontario.

TRADE CATALOGUES.

Silvertown Association Cables and Wires: List No. 40.—Containing full particulars and prices of the products of the India Rubber, Gutta Percha, and Telegraph Works Company, Ltd.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—Last month's shipments from Chili have not been officially announced at the time of writing, but they will no doubt show a considerable expansion, as steamers have been arriving on the West Coast, and no delay will take place in the loading. A large one has just been despatched to Alexandria (Egypt) after discharging a cargo of bags from Calcutta, and it is to be hoped that a sufficient supply of these will be available for the export of the large quantity of nitrate sold for delivery up to the end of March. The total reported is about 1,600,000 tons, of which six to seven hundred thousand tons went to the United States, Japan, etc., and the remainder to Europe. Considerable mystery still surrounds the disposal of nearly a million tons of the Chilean-fertiliser in the latter direction, considering that Germany and Austria, formerly the largest consumers, are out of the market; while the depreciation of the French, Belgian, and Italian currencies raises the cost in these cases to a fabulous level. The cultivation of sugar-beet will be resumed next spring, but on nothing like the pre-war scale pending the restoration of the factories in the devastated regions. Holland, as shown in our last issue, is overstocked with nitrate of soda. Spain and the Scandinavian countries are small users; and Russia, long trumpeted as a vast potential outlet, is "off the mat." The maximum deliveries (including exports) in the United Kingdom were 120,000 tons per annum when prices were 50 per cent. lower and before sulphate of ammonia had been successfully adopted as a substitute. The nitrate producers, although not obtaining their originally "fixed prices," are to be congratulated on having disposed of so large a proportion of their crushing stocks, and it will be interesting to see the ultimate destination of same. Up to the present there are no signs of a large agricultural demand next spring.

Continental Fertiliser Items.—The director of the Chili Saltpetre Investigation Service at The Hague has written a work on what has been done experimentally with this product in the Dutch Indies, it having been used pretty extensively recently owing to the interrupted supply of ammonia salts. Unfortunately, he does not indicate the results of the experiments, which are yet incomplete; but as they have been done on a considerable scale, light is promised in a subsequent volume.

It is announced that a French basic-slag bureau has been formed in Paris with a capital of 500,000 francs. The object of this combination is to take the place of a similar establishment that existed under German control prior to the war.

The Produits Azotes Company, which held its meeting on October 17, declared a dividend of 20 francs for the old shares and 10 francs for the new ones on the 1918-19 working year. The development of business has determined the board to seek fresh waterfalls in Savoie and to establish hydro-electric stations, and such have been found, so that the company will soon be able to produce itself the raw material for its industry. It is experimenting on the production of a high-class fertiliser, which will soon be offered to agriculturists. Progress has been made also in the production of special cyanamide derivatives.

Sulphate of Ammonia.—This material exhibits a home demand that persists, with something also moving for export. In some quarters complaints about present high prices for sulphate of ammonia continue, but when the whole range of circumstances is taken into account it does not appear that the agriculturist has any very substantial grounds for his alleged grievance. He enjoys the highest possible prices for his own produce, and in many other ways the Government have been looking after him with the utmost care. This, of course, has been good national policy in the war-time and the difficult period following the war. It might, in fact, be said that the fertiliser manufacturer has more to make an honest complaint about than the farmer has. One thing is quite clear, and that is that the prices fixed for sulphate of ammonia are such as to suggest strongly to the British farmer the wisdom of early purchases. For example, what he can get for £20. 15s. per ton now, will cost him £22. next spring. The fact that prices are higher than those of a year ago is accounted for by the withdrawal of the Government subsidy and the substantial increase in wages and costs of coal and other raw materials.

Slag and Superphosphate.—There is no special change to be noted in these markets. Superphosphate for Government delivery is slightly dearer, a guaranteed 30 per cent. soluble material, in bags, being £7. 14s.; with 33 per cent. at £8. 9s.; and 35 per cent. at £8. 19s. Potassic superphosphate, 4 per cent. and 26 per cent. is quoted at £9. 1s. 6d. to £9. 2s. 6d. per ton. Slag prices are unchanged for delivery to February.

Nitrate of Ammonia.—Some interesting business is being offered in this very effective nitrogenous fertiliser. The Ministry of Munitions offers material containing 33½ per cent. nitrogen at £25. per ton. Furthermore, 50 per cent. of this nitrogen is in the form of nitrate, and very active. The fertiliser is packed in barrels, which are supplied free.

Cyanamide and Nitrolim.—Both these manufactured forms of nitrates are again reported to be becoming available for the British market at an early date. Both materials have only a short sea voyage to come, and the special demands for war purposes have now, of course, ceased. A great deal of activity, financial and manufacturing, is reported to have taken place in connection with these products of late, and therefore it is high time that some results should mature.

Potash.—The available supplies of potash are declared to be increasing. The Alsatian potash which is being produced is being offered apparently as 14 per cent. sylvinite, 20.22 per cent. sylvinite, and 50.60 per cent. chloride of potash, the first-mentioned description showing 19.25 per cent. of potassium chloride, 60.66 per cent. sodium chloride, 2.5 per cent. calcium sulphate, and 10.12 per cent. insoluble. Furthermore, increased supplies of German potash are expected. United Kingdom supplies of potash are also regarded more optimistically. Recent investigations appear to suggest that the best home sources from which potash can be obtained would be the blast-furnaces of the country. It has even been declared in a recent address that from these blast-furnaces could be produced more than double our pre-war requirements of potash. A current quotation for kainit, 14 per cent. potash, in bags, is £7. 5s. per ton, ex works.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

There has been an exceptionally large number of inquiries for tinplates and manufacturers have little or no trouble in getting rid of their production. The export trade is rapidly expanding, and the industrial situation in America is having a good effect in South Wales tinplate circles. There is now a good demand for all sizes, and the home packers are very urgently pressing for immediate deliveries. The question of re-starting more mills is to be brought before the Manufacturers' Association.

The patent fuel trade continues brisk, and the outputs are still increasing. The expansion of foreign trade is a hopeful sign in this industry, which is growing rapidly, and providing work for many additional hands. At Cardiff, the workers, who asked for 20 per cent. increase in wages, have been granted 15 per cent. to be consolidated into permanent wages. The exports for the week have been very good, and show great advances on those of a few months ago. The Cardiff makers sent out some large cargoes, including 4,050 tons to Havre, and 5,181 tons to Algiers. The shipments from Swansea were in the aggregate the largest since the war, and included 4,268 tons to Venice, 6,150 tons to Antwerp, 3,254 tons to Bordeaux, 8,000 tons to St. Nazaire, 5,168 tons to Civitavecchia, 4,500 tons to Rouen, besides smaller quantities to Dieppe, St. Brieux, La Rochelle, and Dunkirk.

Mr. Edgar Evans, of the Rhondda Research Laboratories, and formerly head of the Chemistry Department of the South Wales School of Mines, is about to proceed to India in connection with coal carbonisation. His services have been secured by a powerful group of financiers, which includes Messrs. R. G. Shaw and Co., Calcutta (who are best known on this side in connection with the Anglo-Persian Oil Co.), Messrs. Tata, Ltd., Bombay, and Messrs. Kilburn and Co. A syndicate has been formed in order to take over and develop an estate belonging to the Earl of Lisburne for the raising of certain blende and lead ore. The new company will have a capital of £50,000.

The coke ovens are all working, and by-product outputs are slightly on the increase. Sulphate of ammonia is selling well, and there are scarcely any stocks on hand. There is an improvement at the basic slag mills, but deliveries are still far behind what they should be.

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d., naked; pure, 3s., naked, at works. Carboic acid, crude, 60%, East and West Coast, nominally 1s. 7d. to 1s. 8d.; crystals, 39-40%, 3½d. to 9d., f.o.b. Crude tar, London, 45s. to 50s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Refined tar, 32s. 6d. per barrel. Pitch, 80s.; East Coast, 70s. to 75s., f.o.b.; West Coast, 62s. 6d. to 65s., f.a.s. Solvent naphtha, naked, London, 90-190%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-160%, naked, London, 2s. 5d.; North, 2s. 2d. to 2s. 3d. Crude naphtha, naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthaline, £16. to £18.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 5¾d.; heavy oil, 6½d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 7d. to 2s. 8d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: home trade, October £20. 10s., November £20. 15s., basis 24½%. Nitrate of soda, £22. to £22. 10s.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of soda continues firm, the quotation on spot for 95-96% quality remaining at £20. 2s. 6d. per ton, net cash, f.o.r. Liverpool, prompt delivery. East Indian bone meal for shipment is without alteration, the quotation for November-December shipment being £17. 10s. per ton, net cash, ex ship Liverpool, for 4½% ammonia and 52% phosphates. On spot, Liverpool, holders ask £17. 10s. per ton, net cash, for 4½% and 45% quality. Mineral phosphates are without alteration, and values at present are only nominal. Dried blood scarce, the value being 30s. to 32s. 6d. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £100. 12s. 6d. to £100. 17s. 6d., cash; £101. 12s. 6d. to £101. 17s. 6d., three months; electrolytic, £113. to £117. Tin: Standard, £277. to £277. 5s. cash; £277. 5s. to £277. 10s. three months; Straits, £276. 15s.; English, £276. to £277. Lead: Soft foreign, £32. 17s. 6d.; English, £34. Spelter, £44. 15s.; hard, £32. to £33. Antimony, English regulus, 90%, £47. 10s. Aluminium, £150. Nickel, £205., delivered; packages extra. Quicksilver, £17. 5s. to £17. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 32s. 6d. per unit.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

Business generally for all heavy chemicals continues good, and values all round are well maintained. Makers are well engaged with orders for caustic soda, bleaching powder, and bicarbonate of soda, and quotations are firm at recent rates. Roasted saltcake steady at 70s. per ton, in bulk, carriage paid. Chlorate of potash easy at 1s. per lb. Soda in fair request at 6d. per lb. Recovered rock sulphur, £16. 10s., on rails. 58% alkali, £6. 10s., on rails, makers' works. Sulphate of copper continues flat, and price nominal at £40. per ton, f.o.b. Commercial hypo. soda firm at £19. per ton. Phosphate of soda higher at £28. per ton. Concentrated sodium sulphide, casks, easy at £21. 10s. per ton. Nitrate of soda scarce on the spot, and price firm at £60. per ton. Nitrate of soda, £21. per ton. White powdered arsenic continues scarce, and price maintained at £60. per ton for Cornish make. Yellow prussiate of potash unchanged at 1s. 10d. per lb. Soda firm at 1s., with very little offering. Acetate of soda in better inquiry, and price steady at £48. per ton. Acetic acid unaltered. English brown acetate of lime, £12. per ton. Grey, £17. per ton. Lead salts are only moving slowly. English white acetate at £83. per ton. Brown, £66., and nitrate £55. per ton. Bichromates are in short supply, and quotations firm. There is only small inquiry for sulphocyanides. Demand for copperas is improving, but there is no change in price. Oxalic acid is now offering at 1s. 1d. per lb. delivered.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

The demand for the heavier chemicals continues active, and a fairly brisk inquiry has been made for the lighter products. There is still a scarcity of some chemicals much in demand, and the prices of them continue very firm. Bleaching powder

has been in fair request. The price for the home trade is £17. per ton, free on rail or conveyance, in buyers' packages. For export, £15. to £18. per ton is quoted. Chloride of calcium has been rather more in request, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has been well inquired for, and stocks are still very small. It is £24. per ton for 76%; £22. per ton for 70 to 72%, and £19. per ton for 60 to 62%. Nitrate of soda has been in fair demand, and is £21. to £22. per ton. Saltcake has again been in good request, and is £6. 10s. per ton, in casks; f.o.b. Soda crystals have met with a brisk inquiry, and are £5. 10s. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda continues to be well inquired for, and is £8. 5s. to £10. per ton, according to terms of delivery. Borax has been in very fair demand. Ordinary is £39. per ton, and powdered £40. per ton. Ammonia alkali has been in good request, but has been in limited supply for early deliveries. Prices are £6. 10s. to £6. 15s. per ton, f.o.r. at works. Hyposulphite has been quiet, and is £18. 10s. per ton for ordinary, and £22. per ton for pea crystals, in 1cwt. bags. Sulphite of sodium has been in moderate request, and is £10. per ton for ordinary, and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been rather more inquired for, and is £20. per ton in casks, and £22. per ton, in drums. Prussiate of soda has been in very fair inquiry, and is 11d. to 1s. per lb. Bichromate of soda has been quieter, and is 9d. per lb. Phosphate of soda has been in quietly steady request, and is £25. per ton. Chlorate of potash has been in moderate demand, and is 1s. per lb. Permanganate of potash has been in somewhat freer inquiry, and is 3s. 6d. per lb. Sulphate of potash has moved but slowly, and is £25. per ton. Carbonate of potash has been in steady demand, and is £95. to £100. per ton for 80 to 85%. Caustic potash has been in good request, and is £120. per ton. Nitrate of potash has sold a little more freely, and is £55. to £60. per ton for refined, and £40. per ton for ordinary. Canadian potashes have been but little in request. First quality Montreal are £200. to £220. per ton, and second quality, £190. to £210. per ton. Bichromate of potash has again been in fair demand, and is 1s. 6d. per lb. Yellow prussiate of potash has been steadily called for, and is 1s. 9d. to 1s. 10d. per lb. Sal ammoniac has been more inquired for, and has again been in short supply. First quality lump is £85. per ton; second quality is £80. per ton, and crushed is £5. per ton extra. Sulphate of ammonia has been in quietly steady demand. Prices are: £20. 15s. per ton for November; £21. for December; £21. 7s. 6d. for January, 1920; £21. 15s. for February; and £22. per ton for March to May, 1920. Carbonate of ammonia has sold rather more freely, and is 6½d. per lb. Muriate has been very quiet, and is £48. to £50. per ton. Magnesia has been in fair request. Carbonate is £2. 5s. per cwt., and sulphate, £11. to £16. per ton, according to grade. Alum has been in moderately active demand, and supplies are still small. Prices are £18. 10s. per ton for home uses, and £18. 10s. to £19. 10s. per ton for export. Aluminoferric has been but little called for, and is £8. 10s. to £12. per ton according to quality. Sulphate of alumina has been in slightly better request, and is £12. to £17. per ton according to grade. Sulphur has been steadily called for, and supplies are still very light. English flowers are £32. per ton; roll is £28. per ton, and rock £22. per ton, in bags, f.o.r. Sicilian grades are, flowers, £28. per ton; roll, £22. 10s. per ton, and rock, £17. 15s. per ton. Cream of tartar has again been in very fair request, and is £12. 10s. to £13. per cwt. Tartaric acid continues to meet with a steady inquiry, and is 3s. 2d. to 3s. 3d. per lb. Boracic acid has been steadily called for, and supplies have been light. Crystals are £72. per ton, and powdered, £74. per ton. From £2. to £3. per ton extra is charged, for delivery in casks. Oxalic acid has been in fair request, and is 1s. to 1s. 1d. per lb. Citric acid has had a quietly steady sale, and is 4s. 3d. per lb. White acetate of lead has been quiet, and is £83. per ton. Arsenic has been in fair, but irregular demand. From £58. to £60. per ton is quoted for white powdered. Sulphate of copper has again been very lethargic. For home trade lots, £40. per ton is asked, and for export, £40. to £41. per ton, less 5%, f.o.b.

TYNE CHEMICAL REPORT.

TUESDAY.

Inquiry continues active, and caustic soda and bleaching powder are in strong request both for home consumption and export. Soda crystals locally are scarce and firm at £5. 10s. per ton, 2cwt. bags. Sulphur very firm.

The following prices are per ton, net: Bleaching powder, softs, £17.; caustic soda, 76-77%, £24.; do., 74-76%, £23. 10s.; do., 70%, £22. 5s.; do., 60%, £21. 10s.; recovered sulphur, 2cwt. bags, £22.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda (saltcake), in bulk, £4.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market very firm and with better shipping facilities. All prompt coals are practically cleared off the market. Forward the position is very firm, and the results of the American strike are being carefully watched. To-day's quotations: Best Northumbrian steam, 95s. to 100s. per ton; do., second qualities, 90s. to 95s.; Northumberland small coals, 75s. to 80s.; do., seconds, 70s. to 75s.; best Durham gas coals, 80s. to 85s.; do., seconds, 65s. to 75s.; Durham bunkers, 70s. to 80s.; do., seconds, 65s. to 67s. 6d.; foundry coke, 100s.; gas coke, 95s. to 100s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

During the past week there was a continued steady and firm demand for all classes of chemicals, and the run of business altogether has compared well with several weeks past. Prices have been to some extent on an up and down level, and noticeable changes are cream of tartar, which is £11. 15s. per cwt., as against £11. 10s. previously, and tartaric acid at 3s. 3d.,

as against 3s. 6d. per lb. previously. The salammoniac group has also changed in value to the prices quoted below, and current quotations at the moment of writing rule as follows:—Arsenic, £62. per ton, net, Glasgow; bicarbonate of soda, £9. 15s., and £10. 10s. per ton for 6-8 casks and 1cwt. kegs, net, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags; and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £25. per ton net, Glasgow; chlorate of potash, 1s. 1d. per lb., net, Glasgow; chlorate of soda, 8d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 98%, £11. 15s. per cwt., net, Glasgow; paraffin wax, U.K. deliveries, 125°, 6½d. to 6¾d.; 121-3°, 5½d. to 5¾d.; 118-20°, 5d.; 110-12°, 4d. to 4½d.; and 98-102°, 4d. to 4½d.; salammoniac, £90. and £85. per ton, net, any port, for first and second lump respectively; salammoniac crystals, £70. per ton, net, Glasgow; saltpetre, £3. net, Glasgow; tartaric acid, 3s. 3d. per lb., 5%, Glasgow.

There has been a good volume of business passing among the different sea oils, but there are no price variations to be recorded on this occasion. Whale oils have been well in the forefront at the old figures of 92s. for pale, 76s. for brown, and 74s. for black; and, as for several weeks past, no yellow has been obtainable by inquirers. Newfoundland cod keeps to the steady level of 80s., and is in good all-round demand; while pale seal at 96s., and Menhaden at 80s., continue to go into consumption with whatever quantities are on the market.

In the coal trade the position of affairs is unaltered, and demand keeps steady with supplies still to the short side. Both from the industrial and domestic standpoint inquiries are on the increase, and prices on the basis fixed by the Coal Controller.

Adelaide, 10 c., £214.; Bahia, 4 c., £111.; Calcutta, 2 c., £58.; Colombo, 3 c., £75.; Durban, 1 c. (F.), £15.; Hong Kong, 5 c., £113.; Knysna, 2 c. (F.), £40.; Melbourne, 3 t. 10 c., £1,495.; Ostend, 1 c., £14.; Pt. Elizabeth, 1 c., £23.; Pt. Elizabeth, 2 c. (F.), £44.; Santiago, Chile, 1 c., £32.; Singapore, 4 c., £101.; Trinidad, 1 cs. (pt.), (F.), £7.; Valparaíso, 1 cs. (pt.), £17.; Wellington, 1 c. (F.), £15.

COAL PRODUCTS—

Alizarine
Bombay, 2 cks., £43.; Melbourne, 8 kgs., £224.; New York, 10 cks., £279.; Sydney, 2 kgs., £56.

Aniline Colour

Adelaide, 3 cs. (pt.), £54.; Alexandria, 3 pkgs., £179.; Brussels, 4 cks., £60.; Calais, 1 ck., £55.; Danzig, 1 cs. (pt.), £8.; Melbourne, 70 pkgs. (pt.), £2,595.; Newcastle (U.S.A.), 1 cs., £10.; Suva, 1 cs. (pt.), £21.

Aniline Dye

Bombay, 2 cks., £79.; Osaka, 13 cks., £691.; Paris, 35 pkgs., £1,123.; Pt. Elizabeth, 9 pkgs., £206.; Rio Grande do Sul, 1 cs. (pt.), £16.; Sydney, 9 pkgs., £360.

Benzonaphthol

Switzerland, 1 cs., £10.

Carbolic Acid

Channel Islands, 1 ck., £9.

Carbolic Crystals

Antwerp, 8 cs., £22.

Cresosote

Rotterdam, 25 cks., £100.

Naphthalene

Kilindini, 2 cs., £6.; Zanzibar, 1 cs., £7.

Pitch

Galatz, 45 cks., £65.; Lagos, 10 brls., £16.; Rosario, 229 cks., £306.; Rotterdam, 2465 t., £7425.

Tar

Accra, 70 pkgs., £50.; Cape Coast Castle, 5 cks., £10.; Galatz, 48 cks., £81.; Kilindini, 5 cks., £9.; Lagos, 5 rnts., £8.; Penang, 45 cks., £81.; Pt. Sudan, 612 drms., £408.

COPPER ACETATE—

Brussels, 1 cs., £21.

COPPERAS—

Shanghai, 4 cks., £7.

CREAM OF TARTAR—

Barbados, 1 c. (F.), £11.; Colombo, 1 c., £14.; Calcutta, 2 c. (F.), £52.; Calcutta, 2 c., £32.; Delagoa Bay, 1 c. (F.), £18.; Durban, 3 c. (F.), £60.; East London, 2 c. (F.), £29.; Fremantle, 2 c. (F.), £25.; Fremantle, 3 c., £39.; East London, 5 c. (F.), £68.; Hong Kong, 1 c., £14.; Karachi, 1 cs., £8.; Karachi, 1 c. (F.), £12.; Mossel Bay, 4 c. (F.), £60.; Paranaguá, 1 c. (F.), £15.; Pt. Elizabeth, 8 c. (F.), £139.; Wanganni, 1 c., £13.

DISINFECTANTS (otherwise undes.)

Aden, 1 c., £7.; Alexandria, 6 c., £12.; Bangkok, 2 t. 14 c., £133.; Brisbane, 2 t. 14 c., £130.; Buenos Ayres, 96 t. 12 c., £5,159.; Calcutta, 5 t. 4 c., £301.; Canton, 4 t. 7 c., £146.; Colombo, 3 t. 7 c., £147.; Constantinople, 6 c., £20.; Corinto, 2 t. 1 c., £124.; Durban, 3 c., £9.; Fiji Islands, 2 c., £6.; Hong Kong, 3 t. 15 c., £146.; Jamaica, 13 c., £21.; Kilindini, 4 c., £21.; Lyttleton, 3 t. 13 c., £48.; Lagos, 4 c., £22.; Madras, 2 c., £12.; Montreal, 2 c., £16.; Newcastle (N.S.W.), 2 c., £14.; Paris, 9 t. 4 c., £250.;

DISINFECTANTS (otherwise undes.)

Perth, 15 c., £53.; Pt. Elizabeth, 5 c., £14.; Rangoon, 9 c., £14.; St. Kitts, 4 c., £12.; Shanghai, 1 t. 14 c., £93.; Trinidad, 5 c., £28.; Winnebago, 14 c., £18.; Zanzibar, 7 c., £15.

ETHER—

Malta, 2 cs. (pt.), £7.

ETHER (SULPHURIC)—

Alexandria, 1 dr., £9.

ETHYL BROMIDE—

Buenos Ayres, 1 cs., £7.

FORMALDEHYDE—

Durban, 1 cs., £6.; Malta, 2 cs., £8.

FULLER'S EARTH—

Montreal, £357.

GELATINE—

Madras, 2 c.; Melbourne, 5 c.; Newcastle, 1 c.

GLUE—

Perth, 10 c.; Rangoon, 2 t. 10 c.

GLUE, SIZE, AND GELATINE—

Alexandria, 1 t. 10 c.; Antwerp, 8 c.; Bombay, 9 c.; Buenos Ayres, 1 t.; Brisbane, 1 t. 8 c.; Calcutta, 5 c.; Cape Town, 3 t. 2 c.; Constantinople, 4 c.; Durban, 2 c.; Dunedin, 1 c.; Genoa, 1 t. 2 c.; Hong Kong, 1 c.; Kobe, 1 c.; Monte Video, 12 c.; Montreal, 18 c.; Rangoon, 4 t. 10 c.; Rotterdam, 5 t. 9 c.; Tokio, 2 t.; Yokohama, 10 t.

GLYCERINE—

New York, 10 t., £600.

GLYCERINE (DISTILLED)—

Amoy, 3 c., £22.; Alexandria, 2 c., £17.; Bangkok, 3 c., £22.; Bahia, 1 c., £8.; Bombay, 3 c., £31.; Calcutta, 1 c., £14.; Constantinople, 1 cs., £8.; Durban, 1 c., £6.; Galatz, 7 c., £50.; Karachi, 1 cs., £6.; Malta, 1 c., £11.; Oporto, 2 t., £221.; Santiago, Chile, 12 c., £106.; Talcahuano, 4 c., £36.; Tokio, 1 c., £16.

HYDROCHLORIC ACID—

Alexandria, 10 c., £22.; Bombay, 2 c., £11.

HYDROGEN PEROXIDE—

Alexandria, 2 cs., £8.; Bombay, 1 cs., £7.

HYPOPHOSPHATE OF LIME—

Oporto, 47 pkgs. (pt.), £41.

IODINE—

Bombay, 10 pkgs. (pt.), £6.; Genoa (F.), 17 cks., £9,767.; Shanghai, 1 cs. (pt.), £33.

IODINE (RESUBLIMED)—

Barcelona, 2 cs., £220.

IRON AND AMMONIUM CITRATE

Bombay, 10 pkgs. (pt.), £5.; Rotterdam, 1 pkg., £25.

IRON HYPOPHOSPHITE—

New York, 4 cs., £101.

LACTIC ACID—

Buenos, 1 cs. (pt.), £5.; Piraeus, (F.), 5 cs. (pt.), £24.

LEAD ACETATE—

Bombay, 2 t., £138.; Genoa, 14 cks., £164.

MAGNESIUM CARBONATE—

Buenos Ayres, 1 ck., £9.

MAGNESIUM CHLORIDE—

Genoa, 1 ck., £5.

MAGNESIUM CITRATE—

Limon, 4 cs., £48.; Shanghai, 1 cs., 1 cs. (pt.), £22.

MAGNESIUM SULPHATE—

Auckland, 5 t. 1 c., £196.; Bombay, 7 c., £20.; Brisbane, 10 c., £20.; Barbados, 13 c., £28.; Cairns, 1 t., £40.; Cape Town, 5 c., £11.; Durban, 14 c., £34.; East London, 16 c., £34.; Fremantle, 3 c., £6.; Dunedin, 6 c., £12.; Galatz, 1 t., £38.; Ipswich (Queensland), 1 t. 6 c., £50.; Karachi, 3 c., £8.; Lyttleton, 1 t. 6 c., £50.; Maryborough, 5 c., £10.; Napier, 5 c., £10.; Perth, 10 c., £20.; Paranaguá, 10 c., £24.; Pt. Elizabeth, 1 t., £44.; Shanghai, 2 t. 6 c., £50.; Wellington, 1 t. 6 c., £50.

MANGANESE BORATE—
Genoa, 1 t. 9 c., \$92.

MANGANESE HYPOPHOSPHITE—
New York, 8 cs., \$317.

MERCURY PERCHLORIDE—
Buenos Ayres, 2 cs. (pt.), \$26.

METHYL SALICYLATE—
Durban (F.), 1 cs., \$9.; Genoa, 9 cs., 18 drms., \$285.; Piraeus (F.), 5 cs. (pt.), \$5.

MIRBANE OIL—
Barcelona, 6 drms., \$37.

MURIATIC ACID—
Trinidad, 1 t., \$40.

NICKEL SULPHATE—
Cologne, 20 cks., \$260.

PHOSPHORIC ACID—
Durban, 1 cs., \$7.; Shanghai, 1 cs., \$8.; Toronto, 6 cbrys., \$81.

PITCH—
Hong Kong, 4 t.; Lagos, 6 t.

PITCH (MARINE)—
Hong Kong, 4 t.

PITCH (SWEDISH)—
Calcutta, 5 t. 10 c.

PLUMBAGO—
Bilbao, 15 t. 3 c.; Christiania, 1 t. 2 c.

POTASSIUM ACETATE—
Shanghai, 1 cs., \$5.

POTASSIUM BICHROMATE—
Beyrout, 10 c., \$300.; Limon, 1 kg., \$10.

POTASSIUM BISULPHITE—
Auckland, 4 c., \$52.

POTASSIUM BROMIDE—
Bombay, 2 cs., \$44.; Durban (F.), 1 cs., \$9.

POTASSIUM CARBONATE—
Bombay, 48 cs. (pt.), \$3.

POTASSIUM CHLORATE—
Piraeus, 2 c., \$18.

POTASSIUM CITRATE—
Bombay, 3 cs., \$78.; Brisbane, 1 cs., \$9.

POTASSIUM CYANIDE—
Alexandria, 1 cs., \$5.; Bangkok, 1 cs., \$14.; Bombay, 1 cs., \$24.

POTASSIUM FERROCYANIDE—
Alexandria, 1 ck., \$31.

POTASSIUM HYPOPHOSPHITE—
New York, 10 cs., \$373.; Paris, 1 cs., \$35.

POTASSIUM IODIDE—
Bombay, 10 pkgs. (pt.), \$11.; Melbourne, 1 cs. (pt.), \$20.; Shanghai, 1 cs., \$77.

POTASSIUM METABISULPHITE—
Antwerp, 3 c., \$39.; Christchurch, 2 c., \$23.; Colombo, 2 c., \$28.; Piraeus, 2 kgs., \$42.

POTASSIUM PERMANGANATE—
Bombay, 10 pkgs. (pt.), \$28.

POTASSIUM SILICATE—
Alexandria, 2 drms., \$10.

POTASSIUM SULPHATE—
Channel Islands, 20 t., \$460.

QUININE—
Antwerp, 3,488 ozs.; Bombay, 12,228 ozs.; Kilindiini, 4,000 ozs.

RESORCIN—
Piraeus (F.), 1 brl. (pt.), \$6.

ROSIN OIL—
Rotterdam, \$122.

SALAMMONIAC—
Kobe, 5 t., \$362.

SALICYLIC ACID—
Bangkok, 2 cs., \$12.

SALT—
Cape Town, 1 t.; Christchurch, 1 t. 2 c.; Cuba, 4 c.; Smyrna, 4 c.

SALTPETRE—
Antwerp, 16 c., \$58.; Bordeaux, 168 t. 13 c. (F.), \$7,500.; Beira, 2 c., \$6.; Barcelona, 2 t., \$106.; Bilbao, 5 t., \$270.; Bombay, 3 c., \$11.; Calais, 2 c., \$1.; East London, 9 c., \$28.; Colombo 8 c., \$28.; Kilindiini, 2 c., \$9.; Pto. Alegre, 19 c., \$60.; Malta, 4 c., \$13.; Paranagua, 5 c., \$18.;

SALTPETRE—
Rio de Janeiro, 1 t. 19 c., \$117.; Santos, 9 t. 18 c., \$600.

SHEEP DIP—
Durban, 1 t. 16 c., \$73.; Madagascarc, 8 c., \$33.

SOAP—
Acera, 3 c.; Alexandria, 5 t.; Adelaide, 9 c.; Amsterdam, 9 c.; Antwerp, 224 t. 17 c.; Auckland, 1 t. 17 c.; Bangkok, 3 c.; Barbados, 1 t. 3 c.; Barcelona, 4 c.; Bermuda, 3 c.; Beyrout, 4 c.; Bilbao, 11 c.; Buenos Ayres, 5 c. Bombay, 2 t. 17 c. Boulogne, 4 t. 9 c.; Canton, 1 c.; Calais, 16 c.; Calcutta, 2 t. 16 c.; Canaries, 2 t.; Cape Town, 1 c.; Casablanca, 5 t. 3 c.; Christiania, 18 c.; Channel Islands, 2 t. 18 c.; Christchurch, 1 c.; Colombo, 1 t. 1 c.; Cologne, 78 t. 11 c.; Copenhagen, 25 t.; Constantinople, 5 t. 10 c.; Cyprus, 1 c.; Demerara, 9 c.; Dunedin, 7 c.; Durban, 12 c.; East London, 1 c.; Genoa, 7 c.; Gibraltar, 1 t. 5 c.; Gothenburg, 1 c.; Havre, 6 c.; Hong Kong, 3 c.; Italy, 4 c.; Jaffa, 1 c.; Karachi, 16 c.; Kilindiini, 1 c.; Lyttleton, 2 c.; Malta, 10½ c.; Melbourne, 4 c.; Milan, 10 c.; Montreal, 3 c.; Mombasa, 6½ c.; Napier, 2 c.; New York, 4 c.; Odessa, 10 t.; Ostend, 2 c.; Perth, 3 c.; Penang, 2 c.; Piraeus, 9 c.; Rotterdam, 22 t. 5 c.; Rangoon, 17 c.; Restoff, 4 t.; Salonica, 4 t. 12 c.; Saigon, 2 c.; Seychelles, 2 c.; Shanghai, 9 c.; Singapore, 3 c.; Smyrna, 4 t. 12 c.; Trinidad, 13 c.; Valparaiso, 2 c.; Wellington, 2 t. 19 c.

SODA ASH—
Alexandria, 10 c., \$13.

SODIUM ARSENITE—
Durban, 1 t. 18 c., \$125.

SODIUM BENZOATE—
Calcutta, 1 cs., \$17.; Piraeus, 3 cs. (pt.), 1 brl. (pt.), \$22.

SODIUM BICARBONATE—
Canton, 1 t., \$30.; Calcutta, 1 c., \$6.; Cape Town, 5 c., \$13.; Cologne, 10 t., \$110.; Colombo, 10 c., \$25.; East London, 6 c., \$10.; Fremantle, 5 c., \$3.; Montreal, 10 c., \$22.; Paranagua, 15 c., \$31.; Pt. Elizabeth, 16 c., \$26.

SODIUM BISULPHITE—
Pt. Swettenham, 10 t., \$300.

SODIUM BROMIDE—
East London, 1 cs. (pt.), \$6.

SODIUM HYPO—
Alexandria, 10 c., \$13.

SODIUM HYPOCHLORITE—
Auckland, 5 c., \$18.

SODIUM HYPOPHOSPHATE—
Bombay, 3 c., \$100.

SODIUM HYPOPHOSPHITE—
Oporto, 47 pkgs. (pt.), \$22.

SODIUM IODIDE—
Gothenburg, 2 cs., \$185.; Shanghai, 1 cs. (pt.), \$11.

SODIUM SALICYLATE—
Bombay, 2 cs., \$21.; Calcutta, 1 cs., \$22.; East London, 1 cs. (pt.), \$7.; Shanghai, 1 cs., \$11.

SODIUM SILICATE—
Delagoa Bay, 2 c., \$9.

SODIUM SULPHITE—
Dunedin, 5 c., \$13.

SULPHUR—
Delagoa Bay (F.), 3 c., \$7.

SULPHURIC ACID—
Hong Kong, 5 t., \$48.; Singapore, 15 c., \$18.; Smyrna, 10 c., \$18.; Trinidad, 10 t., \$174.

TALLOW—
Alexandria, 1 t. 5 c.; Antwerp, 50 t.; Shanghai, 7 c.

TANNIC ACID—
Buenos Ayres (F.), 1 cs. (pt.), \$35.

TARTARIC ACID—
Bahia, 4 c., \$86.; Barbados, 1 c. (F.), \$10.; Beira, 1 c., \$24.; Bombay, 1 cs. (F.), \$8.

TARTARIC ACID—
C. Town, 5 c., \$96.; Christchurch, 2 c., \$38.; Calcutta, 7 c., \$134.; Callao, 2 c., \$39.; Durban, 2 c. (F.), \$36.; Durban, 6 c., \$126.; Karachi, 13 c. (F.), \$219.; Kobe, 10 c., \$187.; Limon, 1 c. (F.), \$18.; Madras, 1 cs. (pt.), \$5.; Pt. Elizabeth, 1 c. (F.), \$10.; Pt. Elizabeth, 2 c., \$34.; Rio de Janeiro, 1 cs., \$5.; St. John's, N.F., 2 c., \$39.; Singapore, 10 c., \$191.; Santiago, Chile, 2 c., \$34.; Talcahuano, 1 c., \$14.

THEOBROMINE AND SODIUM SALICYLATE—
Piraeus (F.), 1 brl. (pt.), \$7.

WAX—
Amsterdam, 1 t. 8 c.; Alexandria, 10 c.; Barcelona, 7 t. 8 c.; Galatz, 1 t.

WHITE LEAD—
Aden, \$71.; Antwerp, \$619.; Bombay, \$125.; Bordeaux, \$620.; Casablanca, \$137.; Calcutta, \$892.; Channel Islands, \$166.; Karachi, \$7.2.; Mauritius, \$140.; Ostend, \$149.; Penang, \$54.; Pt. Said, \$51.; Restoff, \$2,039.; Singapore, \$340.; Timaru, \$111.

MANCHESTER.

Week ending October 29.

ALUM—
Alexandria, 54 pkgs.; Treport, 31 cs.

BLEACHING POWDER—
Rotterdam, 1 ck.

BORAX—
Rotterdam, 80 bgs.

CITRIC ACID—
Alexandria, 1 kg.

COAL PRODUCTS (otherwise undes.)
Alexandria, \$621.; Bombay, \$5,696.; Malta, \$140.; Rotterdam, \$50.; Tonnay Charente, \$2,535.; Rouen, \$80.; Winneb, \$13.

DISINFECTANTS (otherwise undes.)
Bombay, 190 drms.

DYESTUFFS (otherwise undescribed)
Alexandria, 50 cks.

FATTY ACIDS—
Antwerp, 60 brls.

GLYCERINE—
Alexandria, 20 cs.

GLYCERINE (DISTILLED)—
Malta, 7 cs.

IODIFORM—
Bakana, 3 cs.

LEAD ACETATE—
Antwerp, 8 cks.

POTASSIUM BICHROMATE—
Treport, 11 brls.

POTASSIUM NITRATE—
Alexandria, 6 bgs.

SALT—
Montreal, 6,760 sks.; Opobo, 2,500 bgs.; Pt. Harcourt, 1,000 bgs.; St. John, 4,200 pkgs.

SHEEP DIP—
Alexandria, 25 drms.

SOAP—
Alexandria, 3,900 cs.; Bombay, 433 cs.; Cape Palmas, 5 cs.; Malta, 119 cs.; Rotterdam, 32 cs.

SODA ASH—
Rotterdam, 683 pkgs.

SODIUM BICARBONATE—
Alexandria, 20 bgs.; Treport, 6 brls.

SODIUM BICHROMATE—
Gothenburg, 11 cks.

SODIUM HYDROSULPHITE—
Rotterdam, 10 kgs.

TALLOW—
Treport, 47 cks.

TARTAR EMETIC—
Rotterdam, 1 ck.

TITANIUM SODIUM OXALITE—
Treport, 8 pkgs.

MIDDLESBROUGH.

Week ending November 1.

ALUMINA HYDRATE—
Dieppe, 1 t., \$40.

AMMONIUM SULPHATE—
Kobe, 1,784 t., \$34,132.; Yokohama, 231 t., \$4,240.

BARIUM BINOXIDE—
Dieppe, 20 t., \$2,308.; Yokohama, 1 t., \$127.

BARIUM CHLORIDE—
Rouen, 10 t., \$193.

CAUSTIC SODA—
Madras, 51 t., \$901.

COAL PRODUCTS—
Benzole
Dieppe, 8,417 galls., \$788.
Disinfectant
Natal, 47 t., \$1,383.
Solvent Naphtha
Dieppe, 24 galls., \$701.
Toluene
Dieppe, 8,283 galls., \$244.

DYESTUFFS (otherwise undescribed)
Madras, 5 c., \$295.

MAGNESIUM CARBONATE—
Rouen, 11 t., \$423.

PITCH—
Rotterdam, 883 t., \$2,853.

SODA ASH—
Genoa, 19 t., \$134.

SODIUM SILICATE—
Kobe, 20 t., \$240.; Yokohama, 30 t., \$375.

NEWCASTLE-ON-TYNE

Week ending November 1.

BORAX—
Rotterdam, 2 t.

CAUSTIC SODA—
Genoa, 19 t. 2 c.

CHROME ORE—
Bilbao, 250 t.

FERRO MANGANESE—
Bilbao, 200 t.

PITCH—
Dunkirk, 5 t. 5 c.

RED LEAD—
Rotterdam, 1 t.

SODA CRYSTALS—
Rotterdam, 20 t.

TALLOW—
Genoa, 5 t.

WHITE LEAD—
Rotterdam, 6 t.

N. & S. SHIELDS.

Week ending November 1.

ANTIMONY—
Christiania, 10 c.; Montreal, 10 c.

ANTIMONY OXIDE—
Christiania, 1 t. 10 c.

FERRO MANGANESE—
Montreal, 20 t.

GELATINE (EDIBLE)—
Christiania, 11 c.

MAGNESIA—
Montreal, 7 t.

RED LEAD—
Christiania, 1 t.
Montreal, 1 t. 17 c.

SODIUM SILICATE—
Christiania, 10 t. 2 c.

WHITE LEAD—
Montreal, 4 t.

SWANSEA.

Week ending November 1.

CHEMICALS (otherwise undescribed)
Bordeaux, 499 t., \$25,000.

COBALT OXIDE—
Shanghai, 1 t. 1 c., \$1,187.

NICKEL SULPHATE—
Kobe, 11 t., \$660.

ZINC OXIDE—
Genoa, 30 t., \$1,890.

PRICES CURRENT.

THURSDAY, Nov 6, 1919.

PREPARED BY MESSRS. HIGGINSBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified
The prices in different localities may vary.

Acids:—

		£	s.	d.
*Acetic 40% and 60%	per cwt.	29/-	&	43/6

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

CURRENT TOPICS

THE INDUSTRIAL COURTS BILL.

IN its present form we are doubtful whether the Industrial Courts Bill will serve any other purpose than place upon a permanent basis the present temporary Court of Arbitration which, since the armistice, has replaced the Committee on Production. That body dealt with industrial disputes during the war, or, to be more accurate, some of them, because even during the war we were not spared strikes and the threats of strikes. Since the armistice we have admittedly been going along in an uncertain manner, probably owing to the fact that the Wages (Temporary Regulation) Act, which extended until November 21, 1919, the rates of wages being paid in November, 1918, might or might not be renewed after that date. The terms of the so-called railway settlement have now determined that point, and we know that the Wages (Temporary Regulation) Act will continue until at least September 30, 1920. It is, indeed, in the knowledge of this, and as a direct result of it, that the Government have introduced the Industrial Courts Bill. This provides that for the settlement of trade disputes there shall be a standing Industrial Court, consisting of persons to be appointed by the Minister of Labour, of which some shall be independent persons, some representatives of employers, and some representatives of workmen. Such a Court, naturally, would be of the greatest possible assistance as a court of final appeal from Whitley Councils, where these exist, or on the application of representatives of employers and workmen when negotiations have broken down in the absence of the existence of a Whitley Council. The weak point, and the one which limits the utility of such an Arbitration Court, however, is that there is no machinery which will make its awards binding. The Government themselves realised this from the beginning, and sought to make awards binding, but we understand that the trade unions take up the illogical position that having agreed to place a case before the Court—the latter cannot act unless both sides make application—they shall not be bound to abide necessarily by any decisions given by the Court. Whilst granting that a Court of Arbitration, limited as this one apparently is to be, is better than that there should be no tribunal to which reasonably minded employers and employed could submit a case, with the full intention of abiding by the result, it does seem that a strong appeal should be made to labour to approach this question in that spirit of broad-mindedness which alone can place the

industrial positions on a sure foundation. The futility of an Arbitration Court without power to enforce its awards compulsorily has recently been seen in the iron-founders' strike, when a body of men, parties to an agreement for dealing with wages questions, withdrew from that agreement the moment an award was given which did not meet their full demands. To the credit of the vast majority of the unions which were parties to that agreement, be it said that they are loyally abiding by it, but that has not prevented them from suffering severely from lack of employment due to the strike of the iron-founders. If the large trade unions of the country will only come to the decision to enforce upon their members willing adherence to the awards of the Arbitration Court

with, of course, a similar pledge on the part of the employers, which will be forthcoming at once,—we shall have gone a long way towards settling the present disturbed conditions due to the uncertainty caused by constantly recurring labour upheavals. All industries throughout the country are naturally affected by this matter. There seems no logical reason why labour should not trust its destinies to a properly constituted Arbitration Court, upon which its own representatives would sit. No other course seems humanly possible; the alternative is the constant rattling of the strike weapon, and a perpetuation of industrial uncertainty which breeds unemployment. It is to be hoped that the result of the consideration in Parliament of the Industrial Courts Bill will effect this very necessary modification to make that measure as effective as it should be.

TRADE RETURNS.

THE Board of Trade returns for October are of a more favourable character than at any time during the past few years, notwithstanding the fact that imports continue to increase. Exports, valued at £79,061,000., were approximately £12,500,000. higher than in the preceding month, and £36,240,000. more than in October, 1918. As before, shipments of manufactured articles were responsible for the major share of the increase. It must not be forgotten that the railway strike, which practically paralysed the transport of merchandise, would have its major effect upon the October returns, and for that reason the figure cited is the more encouraging. On the import side, the month's trade was valued at £153,486,000., an increase of about £4,860,000. compared with September, and of £35,856,000. over the corresponding period of last year. In both branches of the chemical trade the respective tendencies were in a favourable direction, decidedly so in the case of exports. Shipments of chemicals, drugs, dyes, and colours during the month were valued at £2,546,853., compared with £2,076,000. in the previous month, and £2,002,000. in October of last year. Exports of bleaching powder increased from 1,845cwt. in October, 1918, to 23,633cwt. in the month under review; dyestuffs, from 9,816cwt. to 22,168cwt.; sulphate of ammonia, from 2,806 tons to 13,596 tons, chiefly to France, the Dutch East Indies, and Japan; basic slag, from 137 tons to 2,585 tons;

chemical manures, unenumerated, from 2,780 tons to 4,855 tons; muriate of ammonia, from 1,737cwt. to 9,572cwt.; white lead, from 778cwt. to 14,293cwt.; zinc oxide, from 540cwt. to 2,875cwt.; painters' colours and materials, unenumerated, from 33,278cwt. to 105,882cwt.; saltpetre, from 1,212cwt. to 9,245cwt.; chromate and bichromate of potash, from 1,457cwt. to 2,070cwt.; potash compounds, other sorts, an increase in value from £5,639. to £18,523.; sodium bicarbonate, from 31,345cwt. to 46,617cwt.; caustic soda, from 54,312cwt. to 118,193cwt.; chromate and bichromate of soda, from 10,147cwt. to 12,327cwt.; soda crystals, from 311cwt. to 12,043cwt.; tartaric acid, from 114cwt. to 1,226cwt.; and chemicals, other sorts, an increase in value from £465,916. to £481,682. Declines were therefore few in number, and with the exception of copper sulphate (from 2,846 tons to 708 tons) and soda ash (from 341,713cwt. to 233,578cwt.) were insignificant. The imports of chemicals and allied products were valued at £1,967,034., compared with £2,125,000. in September, and £2,696,000 in the corresponding month of 1918. The arrivals of boracite, borate of lime, etc., coal products (not dyes), potash compounds (other sorts), tartaric acid, barytes, nickel oxide, white lead, and painters' colours and pigments (unenumerated), were on a larger scale; while declines were shown in the imports of acetic acid, sulphur (from 257,220cwt. to 12,256cwt.), carbide of calcium (from 51,298cwt. to 1,519cwt.), cream of tartar, crude and distilled glycerine, soda compounds, zinc oxide, phosphate of lime and rock phosphate, and chemicals, unenumerated (from £1,131,328. to £262,528.).

THE HABER PROCESS.

AT the annual meeting on Tuesday of the Nitrogen Products and Carbide Co. Ltd., details of which appear on another page, the Chairman, Major C. H. Campbell, said:—In the past few months a great deal has been written in the Press as to the merits of the Haber process for the fixation of atmospheric nitrogen in the form of ammonia, but it is evident that a great deal of misunderstanding exists as to the possibilities of this process as compared with the cyanamide method. It is common knowledge that the Haber process was extensively employed in Germany during the war, but according to reliable information, its use is not likely to extend far beyond the district in which it has been developed. Although extremely ingenious, it involves a vast number of operations and intricate processes, besides the employment of very expensive and complicated plant and technical skill of the highest order. According to a recent statement published in the Press, the Germans admit that successful operation depends upon the special skill which they alone have acquired. The intricate nature of the process is perhaps better illustrated by their own words when agreeing to the French Commission visiting the works of Badische Aniline, namely:—"If they, the French, saw the works, they would not be able to duplicate them, and, even when erected, they could not operate them." Moreover, it is a process which is entirely dependent upon coal, and, as such, comes directly under the influence of the high prices now ruling.

TECHNICAL RECORDS OF ACID MANUFACTURE.*

NITRIC ACID.

IN all factories under the control of the Factories Branch, nitric acid is manufactured from crude sodium nitrate and sulphuric acid.

The factory records show in each case the number of retorts working, the amount of crude nitrate charged, whether the latter is wet or dry, and the equivalent amount of NaNO_3 ; the amounts and strength of sulphuric acid used and of strong and weak nitric acid obtained (including lower nitrogen acids reckoned as HNO_3); the nitre cake produced and despatched and the acidity thereof; the efficiency of working, etc. In checking these figures the following numerical relationships were employed:—

NaNO_3	...	...	...	HNO_3
85	...	...	...	63
1.35	...	...	...	1.00

Hence, to obtain 1 ton of HNO_3 requires by theory the decomposition of 1.35 tons of NaNO_3 ; and since crude nitrate contains 94 to 98 per cent. of NaNO_3 , the purity of this material must be considered in calculating the efficiency.

At factories where the nitrate was dried, the records show the amounts of wet crude nitrate charged to the drier, its percentage of NaNO_3 and water, and also the dried nitrate produced and its composition. If bag-washing plants were in operation, the records show the number of unwashed bags charged, the number of dried bags, and the amount of sodium nitrate produced.

MIXTURES OF NITRIC AND SULPHURIC ACIDS.

The mixed acid used for nitration is made from calculated quantities of various constituent acids—viz., oleum, sulphuric acid, nitric acid, and also spent acids, the latter being used especially in the production of nitrocellulose, mononitrotoluene (MNT), and dinitrotoluene (DNT). The mixing records, therefore, give the consumption of certain quantities of these acids, together with the production of corresponding quantities of mixed acids of definite compositions. Considerable difficulties were experienced on all factories in reconciling quantities of mixed acids produced with the quantities of oleum, sulphuric and nitric acids employed. In more than one case, a complete re-calibration of all vessels employed for acid measurement and storage was found necessary, and errors amounting to 2 per cent. were discovered.

SULPHUR TRIOXIDE (SO_3).

Practically all the sulphuric-acid producing plant in operation at H.M. Factories falls into the class known as oleum plant—that is, it is capable of producing sulphur trioxide, which can be delivered, in combination with greater or smaller quantities of water, as oleum or as sulphuric acid of any required strength. Usually the water required to combine with the sulphur trioxide is supplied in the form of a more or less dilute sulphuric acid, the reason being that direct reaction between sulphur trioxide and water alone is not practicable, for various reasons which need not be discussed here.

The records for the oleum plant indicate:—

(1) The amount of sulphur burnt, either as crude sulphur or in the form of pyrites, and the sulphur tri-

oxide which should theoretically be obtained from the equivalent amount of pure sulphur.

(2) The amount of sulphur trioxide put into the plant in the form of feed acid—i.e., acid for drying and absorption towers.

(3) The amount of sulphur trioxide obtained from the plant, partly as weak acid from the drying towers, partly in the form of the desired product—i.e., as strong sulphuric acid or oleum.

The efficiency of the plant is then deduced from these data in the following manner:—

From the total sulphur trioxide delivered by the plant, both in the form of weak acid and as the desired product, is subtracted the amount of sulphur trioxide delivered to the plant in the form of feed acid. The difference obtained represents the amount of sulphur trioxide produced from the sulphur or other material burnt. This amount, divided by the sulphur trioxide theoretically equivalent to the sulphur in the material burnt, gives the efficiency of working. The sulphur trioxide theoretically equivalent to the sulphur burnt is obtained from the following equation:—

$$\begin{array}{rcl} 2 \text{ S} & + & 3 \text{ O}_2 & = & 2 \text{ SO}_3 \\ \hline 2 \times 32 & + & 3 \times (2 \times 16) & = & 2 \times 80 \\ \hline 64 & + & 96 & = & 160 \\ \text{or } 100 & & & & 250 \end{array}$$

from which, for each part of sulphur consumed, 2.5 parts of sulphur trioxide should be obtained at 100 per cent. efficiency.

WASTE ACID TREATMENT.

The waste acid from the nitration process consists of the sulphuric acid originally used for mixed acid, together with the water formed or added during nitration, and any unchanged or reduced nitrogen acids formed from the excess of nitric acid originally used, less a certain loss of both sulphuric acid and nitric acid in some cases—e.g., where the waste acid is displaced by water, due to sending the last acid runnings down the drain. It is obvious that this valuable material cannot be wasted, but must be treated to recover in a usable form the nitric acid and sulphuric acid which it contains. The operation used for this purpose is known as denitration. In the case of nitroglycerine or T.N.T. waste acid, this operation is carried out in columns in which a descending current of the waste acid meets an ascending current of superheated steam. The effect of the steam is to decompose the derivatives of the nitric acid and to drive these off along with any nitric acid present in the form of gas or vapour, which is recovered in absorption towers. The sulphuric acid recovered at the bottom of the denitration column should be entirely free from nitric acid and other nitrogen compounds.

Nitrocellulose waste acid, on the other hand, is treated in stills, which are heated by external firing. The nitric acid, being more volatile than sulphuric acid, is driven off in the form of vapour with relative ease and is collected by means of suitable condensing apparatus. The nitric acid so obtained is, for the most part, in the form of strong acid, but a certain amount of water is invariably driven off as the temperature rises, so that the later fractions of the acid are considerably weaker than the first fractions. Since it may not be possible to use all the weak nitric on the plant—i.e., the weak nitric

* Abstracted from the Report on the statistical work of the Factories Branch issued by the Ministry of Munitions (Department of Explosives Supply).

acid delivered by both the stills and the retorts—for acid mixing in the manufacture of nitrocellulose, it is customary to collect all the weak nitric acid which cannot be utilised for acid mixing purposes, and to mix it with strong sulphuric acid. This mixed acid is then returned to the stills and the nitric acid distilled off, most of the water remaining with the sulphuric acid. Since, however, any distillation of this kind will always yield a certain proportion of the nitric acid in the form of weak acid, it is obvious that there is a continual circulation of nitric acid through the stills in the process of conversion to strong nitric acid.

The same consideration applies, to a certain extent, to the treatment of nitroglycerine waste acid. The denitration of this acid in columns gives rise to a relatively weak nitric acid, which, if it cannot be utilised for acid mixing, is strengthened by being mixed with strong sulphuric acid, the mixture being then distilled in order to drive off the nitric acid as free as possible from water. In this operation a small quantity of weak nitric acid is again formed, which in turn must be mixed with strong sulphuric acid and re-distilled.

The effect of denitration, whether carried out in denitrators or stills, is to leave the sulphuric acid practically free from nitric acid, but associated with so much water that concentration is necessary before it can be effectively re-used. The process of concentration consists in heating the acid by suitable means so that water is driven off, leaving a much stronger sulphuric acid.

Naturally a certain loss occurs both in denitration and in concentration, and this loss is obviously inevitable in the manufacture of each particular explosive. It is the object of the denitration and concentration records to show clearly the amount of this loss at every point. The denitration records, therefore, give the amount and composition of the waste acid treated (reckoning all lower nitrogen acids in terms of equivalent HNO_3), and the amount and strength of the nitric acid and sulphuric acid recovered. From these figures the loss of each material is determined.

Similarly, the concentration records show the amount and strength of the acid charged to the concentrators and the amount and strength of the acid produced. All these losses are expressed in terms of HNO_3 and H_2SO_4 .

As in the case of the acid mixing records, considerable difficulty was experienced in obtaining consistent data. In one factory, after the major losses in the denitration of nitroglycerine waste acid had been eliminated, the efficiency of nitric acid recovery climbed very rapidly, and for a considerable period actually appeared to be slightly over 100 per cent. A careful examination into the accuracy of the measurements at all points was made, and the anomaly was finally traced to faults in the analytical method employed for the determination of the nitrogen acid content of the waste acid. So accurate and complete were the measurements that they sufficed to lead to the discovery of an inaccuracy in analysis of less than 1 per cent.

ECONOMICAL USE OF RAW MATERIALS.

It is seen from the foregoing that the chief materials which are consumed in the acid section of a factory producing explosives are sodium nitrate and sulphuric acid. The quantities of these which are consumed in any factory per ton of explosive produced will constitute the test of the efficiency of manufacture, and the records will enable the points at which losses occur to be determined. It

follows then that the records, if properly utilised, constitute an important factor in the control of the processes involved, and in reducing to an absolute minimum the consumption of materials for any given output.

The sodium nitrate consumed per ton of product must be determined:—

- (1) From the efficiency of the retorts, which produce from it the nitric acid employed in nitration;
- (2) From the amount of this nitric acid which is found to have been consumed for a given production.

The first factor is readily determined from the retort records. To obtain the second factor—namely, the amount of HNO_3 consumed per ton of product, it is necessary to take into consideration several details. The amount of nitric acid made in a given period may bear a very uncertain relation to the amount actually consumed during this period. To determine the latter quantity, stocks of fresh and waste acid must be taken into account, and, where nitration is carried out in more than one stage, the stocks of intermediate nitro-bodies and of the various mixed and spent acids handled at each stage must be also considered.

Broadly speaking, the amount of nitric acid used will be the amount of HNO_3 in the fresh acid or acids used for nitration less the amount of HNO_3 which is recovered by the various denitration processes, always with the reservation that due allowance must be made for variations in stocks, as mentioned above.

When the consumption of nitric acid has been determined, it is a simple matter to deduce from the retort records the amounts of sodium nitrate and sulphuric acid which are equivalent to this consumption. The sulphuric acid consumed in nitration is given by the difference between the amount of H_2SO_4 in the fresh acid used and in the waste acid recovered. In addition, any possible loss of sulphuric acid in the process of denitrating the waste acid must be determined, and finally, the amount which has been lost in the concentration of this denitrated acid and of any other weak acid which has to be dealt with, such as that resulting from sulphur trioxide manufacture, and the weak sulphuric acid obtained from the stills in the process of converting weak nitric acid to strong nitric acid in the manufacture of nitroglycerine and nitrocellulose. With the same reservation as regards variations in stocks at all points, the quantities of H_2SO_4 lost in denitration and in concentration will be deduced from the various plant records, and when this has been done the total loss of H_2SO_4 for a given output is readily determined.

(To be continued.)

INDIA AND DYESTUFF IMPORTS.—Representations made by the American Chamber of Commerce in London have resulted in the Government of India instructing their Customs officers to admit freely into India prohibited dyes and dyestuffs ordered before September 6 from other than ex-enemy countries and shipped before January 1, 1920. On September 9, says the American Chamber in London, a cable was received from the National Aniline and Chemical Company of New York, stating that the Indian Government had, without warning, prohibited the import into India of all dyes and dyestuffs shipped from the United States after September 6. As no previous notice had been given, orders had been booked and dyes and dyestuffs were being specially manufactured, packed, and labelled for the Indian market, and would be unsaleable elsewhere. The American Chamber of Commerce in London put the facts before the India Office, and suggested that special licences should be granted to those firms who had booked orders prior to September 6, in order to allow them to complete their manufacturing and to ship their goods. The result is stated above. The Australian Government, a few months earlier, under similar circumstances, granted a period of grace amounting to three and a half months.

INDUSTRIAL CHEMISTS.

THE first of the winter meetings promoted by the Technical Section of the Newcastle Chemical Industry Club was held last week under the presidency of Mr. O. Smalley. Three papers were delivered, the first being on

"THE WORK AND PROBLEMS OF A GAS CHEMIST," by Mr. G. Weyman, M.Sc., A.I.C., of the Newcastle and Gateshead Gas Company.

Mr. Weyman said that the work of a gas chemist covered a very wide ground; it included both organic and inorganic chemistry, besides a large amount of work which, strictly speaking, belonged to other sciences. Physics and physical chemistry were especially required, while pure mathematics and geology were sometimes called upon. Problems in engineering were usually dealt with by experts in that science; but for the rest, it was the chemist who had to furnish the answer.

Dealing with the analytical section of the work of a gas chemist, Mr. Weyman said that, in the first place, raw materials had to be checked. The chief one—coal—was a problem in itself, not only regarding the obtaining of proper samples made up of many different types of coal, but also regarding examination of the sample for the required quality. To sum up the relative qualities of two coals was not an easy matter. Other raw materials, such as oxide of iron, lime, sulphuric acid (when that was not manufactured at the gasworks), caustic soda, and—quite an important item—water, all required correct sampling and analysis, some of them being bought to specification or on an analytical basis, and special tests had often to be made as to suitability for particular purposes. As regards finished products, a close check was necessary on the chief product—gas. Constant gas analysis, with determination of calorific value, specific gravity, sulphur, naphthaline, ammonia, and cyanogen were needed, though much time and trouble might be saved by the use of recording instruments. The second most important product, coke, also needed examination in much the same way as coal. Many other products, such as sulphur, spent oxide, sulphate of ammonia, and concentrated liquor, were sold on an analytical basis; while others, such as tar and tar products, benzole, toluol, solvent naphtha, motor spirit, naphthaline, and cyanogen compounds, were sold to specification, and therefore needed careful and duplicate analysis.

Speaking of the supervision of the chemical plant, he said that since all the processes in a gasworks were chemical in their nature, it was obvious that the chemist must play the most important part in their control, and be responsible for the methods of working and the results obtained. It was for him to reduce losses to a minimum, report daily as to efficiency, and make suggestions as to improvements. The foreman had to take his instructions from the chemist regarding all details of the method of working. The chemist included in his supervision all the analytical work necessary to keep a careful control and submit his daily figures to the chief chemist. Such supervising chemists were placed in charge of retort-houses, condensers and scrubbers, purifiers, water-gas, sulphate, concentrated ammonia, benzole, and boiler plants. His training tended to become specialised, and involved measurement of high temperatures, losses by radiation, conduction, diffusion, vapour pressures, and gas pressures, etc. In connection with working trials, he mentioned that that section included trials of new plants as well as special tests of established plants. Means of measure-

ment of solids, liquids, and gases had usually to be improvised. A well-balanced judgment of the size of errors was essential. The sources of loss and efficiency had to be indicated, and suggestions made as to further avoidance.

Referring to the work of obtaining data for and the introduction and working up of new and special processes, Mr. Weyman said that section really came under the heading of applied research. Sometimes difficulties were not realised until a process was applied on a large scale; more often a small-scale plant would supply an almost bewildering number of previously unrealised factors, and much time and trouble was wasted in neutralising effects which on a large scale corrected themselves.

"THE WORK OF A PAINT AND COLOUR CHEMIST."

Mr. J. Y. Reed, the author of a paper on this subject, said that it was only in comparatively recent years that the need of extensive research had been fully realised in the paint, colour, and oil industry. America had, perhaps, shown us the way regarding paints; and just prior to the war Germany had made rapid progress in the making of colours, both aniline dyes and finished colours, also in the preparation of other materials for paint making. During the war, however, the colour chemists of this country had shown that they could meet all needs by investigating new sources of supply and utilising fresh methods for obtaining results. A paint-works chemist regarded paint of any description under three heads—namely, pigment, medium, and thinners.

Dry pigments for paint making were chiefly obtained from the following sources: Natural or earth colours, such as oxide of iron, umbers and siennas, various forms of vegetable and lamp blacks, and graphite. All these had to be tested for colouring and strength when reduced with white lead or zinc oxide, and more than a trace of moisture was fatal to success in paint grinding. Matter soluble in oil or turpentine had also to be tested for specific gravity, as a too heavy pigment was not desirable. Mr. Reed described the manufacture of white paint at some length. The materials employed had to be tested as to their behaviour with the mediums and thinners to be used in manufacture. Paint manufacturers who made their own white lead had an advantage in being better able to control the uniformity of the material. He held that a paint chemist required some knowledge of engineering, as so much depended on the physical side of the processes, so much so that some chemists specialised on dry-colour making alone.

The testing and analysis of dry colours required a full knowledge of the chemical and physical qualities and analysis of most metals owing to variety of the requirements. The grinding medium afforded a great deal of work to the chemist: in dealing with thinners nothing could be taken for granted. The chemist usually had the work of checking the drying of the finished product, arranging exposure tests under real conditions, and making records of the tests. In conclusion, Mr. Reed said that a paint-works chemist was of little real value if he confined his energies to turning out a few beautiful analyses per week. Accuracy in analysis was not enough; there was a need for highly cultivated powers of observation and a quick method of arriving at results without sacrificing thoroughness and accuracy.

A third paper, by Mr. C. L. Haddon, M.Sc., dealt with "The Work of a Shipyard Chemist." On each of the papers a brief discussion took place.

PHOTOGRAPHY OF COLOURED OBJECTS.

AT the opening meeting of the newly formed Chemical Section of the Manchester Literary and Philosophical Society, Professor Sir William J. Pope, M.A., D.Sc., LL.D., F.R.S., Professor of Chemistry in the University of Cambridge, gave an address on "The Photography of Coloured Objects." Sir Henry A. Miers, M.A., D.Sc., F.R.S., Vice-Chancellor of the Victoria University of Manchester, presided.

The ordinary photographic plate, said Sir William, is sensitive only to blue and violet light and not to red or yellow. The plate thus receives much the same impression of a parti-coloured scene focussed upon it as we should receive on viewing the scene through deep-blue spectacles. The prime requisite of any photographic process for the representation of parti-coloured objects is obviously that the photographic plate used should be sensitive to light other than the blue and violet; given a plate which is acted upon by light from any part of the visual spectrum many devices become applicable for the production of a satisfactory presentment in monochrome of the coloured object or for the reproduction of the actual component colours. The first truly scientific appreciation of this principle was stated by Clerk Maxwell, the first Cavendish Professor in the University of Cambridge. Maxwell remarked that "by finding photographic materials more sensitive to less refrangible rays the representation of the colours of objects might be greatly improved." Long after Maxwell's day it was discovered that the ordinary photographic plate can be rendered sensitive to green, yellow, and red light by incorporating certain dyestuffs with the material of the sensitive film; previous to the war all the various methods of colour photography—the first of which was devised by Professor Joly, of Dublin,—the modern processes of photographic colour-printing, and the present-day panchromatic photographic methods for obtaining a correct rendering in monochrome of parti-coloured objects, were based upon the success which had been attained in imparting sensitiveness throughout the visual spectrum to the ordinary blue-sensitive photographic plate. By staining the plate with erythrosine it becomes sensitive to green and orange; plates so treated are termed orthochromatic.

A number of dyestuffs belonging to the class of cyanine dyes discovered by Greville Williams, in 1856, are capable, however, of sensitising a photographic plate throughout the whole range of the visible spectrum. These substances are difficult to make, and but little concerning their preparation and chemical behaviour has been published; their photographic applications were carefully studied by several of the large German coal-tar colour firms, and those most suitable for use in colour photography were selected and put on the market under trade names which disguised their chemical identity. At the outbreak of war the Allies were entirely dependent on Germany for these so-called photographic sensitisers; such substances had never been made in this country, and but little information as to the identity of the chief sensitisers and their methods of preparation was available.

The experimental investigation of sensitising dyestuffs was instituted in the chemical laboratories of the University of Cambridge by Dr. W. H. Mills and myself at the end of 1914. Methods for producing the ordinary sensitising dyestuffs on a technical scale were devised, and

all the sensitisers used by the Allies have been prepared in the Cambridge laboratories since the German importation ceased. Our photographic air-service was non-existent at the outbreak of war; it was slowly built up until it ultimately became of great magnitude and attained a high efficiency. It started by using ordinary blue-sensitive plates, but at the date of the Armistice some 80 per cent. of the plates used were red-sensitive or panchromatic plates.

The best panchromatic plate made in pre-war days possessed about one-third the sensitiveness to red as to blue light. At the present time a very rapid panchromatic plate is on the market which is much faster to red than to blue light; the rapidity of the plate to red light has been thus increased about four-fold. The advantages to be gained by the skilful use of the present highly perfected panchromatised plates in our photographic air service, in the circumvention of camouflage colour schemes, and in the photography of distant scenes in spectroscopically pure light, are among the most important studies of the new service. The peace applications of panchromatic plates will undoubtedly multiply rapidly.

The chief processes at present available for the photographic reproduction of the colours of parti-coloured objects were then explained, and examples of each were exhibited.

GERMAN ANILINE DYE SHARES.

THE Geneva correspondent of *The Times*, in a message dated November 3, states that down to last month the share capital of the German aniline dyestuff industries amounted to 371.2 million marks. The average quotation of the shares was 500 per cent., so that an amount of about 1.9 milliard marks, or less than £19,000,000, would have been sufficient for purchasing the whole German aniline dyestuff industry by foreigners. As a matter of fact, Swiss, Dutch, and Allied buyers, since the war, have purchased German aniline dye shares, for which they paid very high prices, of course in German marks, which were very cheap for them. This situation became dangerous from the German point of view, and in order to stop it the six leading aniline dyestuff firms have taken the following action during the last weeks.

First of all, they doubled the share capital by issuing 371.2 million marks of new shares practically at par—namely, 107 per cent.—thus watering the capital. Foreseeing the possibility of a purchase of a majority of the doubled watered capital by foreigners, they created preferential shares, of a nominal amount of 300,000,000 marks, having double the voting power of the ordinary shares. These preferential shares will yield an interest of $3\frac{1}{2}$ per cent. only, and will remain in the portfolios of the aniline dyestuff factories. In this way the majority of the voting power of each German aniline dyestuff factory will be in the portfolio of the other five companies.

The effect of this measure is easily understood; all the foreigners who have purchased German aniline dyestuff shares for the purpose not only of enjoying a dividend, but of controlling this German standard industry, have been out-manœuvred: the real control remains with the German aniline dyestuff combine. The six firms have mutually guaranteed to themselves the national German character.

SOCIETY OF CHEMICAL INDUSTRY.

MANCHESTER SECTION.

A MEETING of the Manchester Section of the Society of Chemical Industry was held at the Grand Hotel on Friday of last week, Mr. John Allen presiding. The chairman said that meetings additional to the usual monthly ones had already been arranged, so as to accommodate further papers that had been promised. Mr. Raymond Curtis had offered a paper on "The Manufacture of Mustard Gas," and Mr. E. L. Rhead had promised one on "The Corrodibility of Metals other than Iron." The dates of these meetings will be announced in due course.

Prior to the usual proceedings an electrical distance thermometer, manufactured by the Cambridge Scientific Instrument Company, was exhibited and explained. A vote of thanks to the exhibitors was moved by the chairman and carried.

A paper by Dr. T. Callan and Dr. J. A. R. Henderson on

"THE ESTIMATION OF *p*-PHENYLENE DIAMINE"

was read by Dr. Callan.

p-Phenylene diamine, said the author, was largely used in the colour and fur-dyeing industries, and as no method had hitherto been available for its exact determination a method of analysis had been devised depending upon the quantitative formation of *p*-benzo-quinone-dichloroimide by the action of an alkaline solution of sodium hypochlorite according to the equation:—

The method employed is to add a solution of the *p*-phenylene diamine to excess of an alkaline solution of sodium hypochlorite previously standardised against N/10 arsenite solution, using starch-iodide paper as external indicator, and, after the formation of the insoluble chloroimide is complete, again determining the amount of available chlorine present in the solution with N/10 arsenite. Under the conditions employed it was found that the precipitated quinone dichloroimide had no reaction on starch-iodide paper. From the difference between the blank and the experiment the amount of *p*-phenylene diamine is calculated, 1 c.c. of N/10 arsenite solution being equivalent to 0.0018gm. of *p*-phenylene diamine.

Naphthylene 1:4 diamine behaves similarly to *p*-phenylene diamine, whilst *p*-amido diphenylamine reacts according to the following equation:—

and can also be estimated by the same method.

The introduction, however, of a sulphonic-acid group into the molecule results in the formation of soluble chloroimides, and in such cases the method fails.

A second paper by Dr. Callan, Dr. Henderson, and Mr. R. Barton, on

"THE ESTIMATION OF SULPHURIC ACID IN PRESENCE OF ORGANIC SULPHONIC ACIDS"

was also communicated.

The estimation of sulphates and sulphuric acid in the presence of organic sulphonics acids, said Dr. Callan, was of considerable interest to those concerned with the analyses of intermediates used in the dyestuff industry. Many such intermediates contained sulphates or sulphuric acid derived from the excess of sulphuric acid used in the sulphonation of hydrocarbons, such as benzene and

naphthalene, etc., and their nitro-, amino-, and hydroxy-derivatives. In the very voluminous literature relating to the determination of sulphuric acid there was no special reference dealing with the effect of organic sulphonics acids, and as these substances might effect the determination in opposite directions—viz., by the contamination of precipitated barium sulphate by co-precipitated barium sulphonate and the possible solubility of barium sulphate in solutions of sulphonics acids—the methods usually employed had been examined from that point of view, a considerable number of organic sulphonics acids of the benzene and naphthalene series containing known amounts of sulphate being analysed by various methods, with the result that neither of those factors had been found to exert a disturbing influence. A modified volumetric method for the rapid determination of sulphuric acid was also described. This consisted in adding excess of N/4 barium chloride to the previously neutralised solution, and after boiling for two or three minutes titrating the excess of barium chloride with N/4 potassium chromate, the end point being ascertained by spotting the solution on to starch-iodide paper and touching the clear rim with a drop of very dilute hydrochloric acid. In the presence of the slightest excess of soluble chromate a blue coloration, due to liberation of iodine, is obtained.

A short discussion ensued, in which the chairman, Dr. Bloch, Mr. L. E. Vlies, Dr. T. J. I. Craig, and Messrs. Heywood, J. R. Hannay, W. F. Gibson, and L. Blundell took part. A vote of thanks to the authors was proposed by Mr. Hannay, seconded by Mr. Blundell, and carried unanimously.

YORKSHIRE SECTION.

"The Origin and Growth of Expert Evidence" was the subject of a paper read at the first meeting of the new session of the Yorkshire Section of the Society of Chemical Industry, held at the Queen's Hotel, Leeds, last week, by Mr. W. McD. Mackey (chairman).

The medical man was, he said, the earliest example of the expert witness in a modern sense, but he was generally a witness in criminal proceedings. Speaking of civil actions, Mr. Mackey said that the best scientific witness was the one who rigidly adhered to the attitude of placing his knowledge unreservedly at the disposal of the court, and who did not allow himself to act in the capacity of advocate. The value of a legal training for scientific men could, however, be over-estimated. Some scientists with a knowledge of law might conceivably prove to be a nuisance; on the other hand, some acquaintance with the main principles underlying the law might be desirable.

Mr. C. Harold Wright, an agricultural chemist of Fiji, also read an interesting paper on "The Change of the Refractive Indices of Fixed Oils with Temperature."

EDINBURGH AND EAST OF SCOTLAND SECTION.

There was a good attendance of members at the opening meeting of the Edinburgh and East of Scotland Section of the Society of Chemical Industry, under the chairmanship of Dr. S. Jordan.

In the course of his address Dr. Jordan dealt with the original recognition of catalytic action by Berzelius, and the general characteristics common to reactions of this class. The discovery of the organic catalysts or enzymes was described in greater detail, showing how they were eventually recognised by Moritz Traube to act in the same way as the inorganic catalysts. The principal

manufacturing processes in which enzymes are made use of were discussed, special attention being paid to processes where the older empirical methods were giving place to methods based on the results of scientific investigation. The influence of enzymes in the tanning industry was referred to, and particularly the modern substitutes for the old puering process. Recent developments in the application of enzymes, or of the bacteria and moulds producing them, were described, among them the preparation of acetone by the action of ferments on starch, and the treatment of distillery waste as devised by Effront and carried out at Nesle, in France, whereby large quantities of organic products are recovered from what was formerly an inconvenient waste product. Lastly, the probable course of future developments in enzyme chemistry was briefly sketched, culminating in the possibility of the synthesis on the large scale of complex organic compounds by taking advantage of the reversibility of the catalytic processes induced by the enzymes, and in the synthesis of the enzymes themselves when their constitution has been fully investigated.

THE SPECTROSCOPE IN SCIENCE.

AN interesting paper was read at the Society of Arts on Friday evening (November 7) before the Technical Inspection Association by Professor Baly, C.B.E., F.R.S. (of the University, Liverpool), on the subject of "The Spectroscope in the Science of To-day," the chair being occupied by the President of the Association, Mr. A. H. Collinson, C.B.E., M.Inst.C.E.

Professor Baly dwelt upon the extreme importance of the spectroscope in all research work, giving instances of its extended use by three independent groups of scientific men—viz., astronomers, chemists, and physicists; but the line of demarcation between these respective groups was so defined that very little information as to the work done by any one group was known to either of the others. Professor Baly urged the importance of the extended use of the spectroscope in all branches of scientific investigation, and he believed the time was approaching when it would be in daily use by the commercial exponents of applied science, as much as by those working in the realms of pure science.

The lecture was illustrated by lantern slides, and was received by the members of the Association with much appreciation, some of them having already made use of the spectroscope for investigations in workshop practice.

The President, in proposing a vote of thanks to the lecturer, pointed out the uses that might be made of this instrument for the detection of impurities in metal—for instance, the presence of lead in brass,—and asked whether it was impossible to use the spectroscope for quantitative analysis.

Mr. Humphry (lately chief analyst to the Government Inspector of Steel at Sheffield), Mr. Perry (chemist to the Inspection Department at the Royal Arsenal, Woolwich), Messrs. Wilson, Wade, and Davey, all congratulated Professor Baly on his paper, and referred to the uses that they had themselves made of the spectroscope in the work of investigation. Mr. Perry, in particular, pointed out that if the facts claimed by Professor Baly as having been definitely ascertained in regard to the composition of the nebulae in space could be relied upon—viz., that all the known so-called "elements" were by natural processes evolved from hydrogen and helium; with possibly a third not yet discovered on the earth and for the present named nebulium—it would appear that an epoch-making

change in thought in regard thereto was at hand, even to the extent of admitting that the dream of the old alchemists of the transmutation of metals was possible of realisation.

Professor Baly, in his reply, admitted that there was this possibility, and, in regard to the President's inquiry, stated that quantitative analyses would be possible if the spectroscope were more generally studied in the schools and laboratories of the country, and he urged that it should be one of the subjects taught to every student intending to graduate in applied science.

THE GERMAN POTASH SITUATION.

THE law passed by the German National Assembly last April for the regulation of the potash industry stipulates that a sales community shall be formed by producers of potash. In accordance with this provision the members of the Potash Syndicate met at Berlin on October 17 and constituted the Deutsche Kali Syndikat, G. m. b. H., for this purpose with a share capital of 1,500,000 marks (£75,000. par value). All the existing members of the Syndicate and the so-called special works have joined the new company, and the agreement entered into by the constituents has to be submitted for approval to the "Imperial" Potash Board created under the above-mentioned law. All the directors of the old syndicate, with the exception of one who has migrated to Holland, have been elected as the board of directors of the new company, and at the next meeting, when the approval of the agreement by the Potash Board is expected, additions to the directors will be made in the form of the election of two representatives of the workmen, one for the officials (staff), and one representing the interests of consumers.

It was mentioned at the meeting that the sales of pure potash (K_2O) in the first nine months of the present year had been less by 300,000 tons than in the corresponding period of 1918, and the prospects for the final quarter are unfavourable in consequence of the scarcity of coal and the inadequacy of the rail transport facilities. German agriculture and industry are suffering from these difficulties, as it is impossible approximately to meet their requirements in potash. Having regard to the importance of supplying domestic agriculture with potash salts it was stated that exports are being kept within very moderate limits. As a consequence the potash industry is neither able to contribute sufficiently towards an increase in agricultural products at home nor to utilise the immeasurable mineral resources, which are in increasing request all over the world, in order to cause the mark currency to appreciate and pay for urgent food products and raw materials. Moreover, the workmen have put forward new demands which cannot be fulfilled, and the prices of coal and other materials have again considerably advanced in the past few weeks.

Since the above meeting it is reported that the Americans, who had been opposed to a potash contract with Germany in expectation of receiving deliveries from France, are now pressing for the conclusion of a contract with the Potash Syndicate. But owing to the difficulties set forth at the Berlin meeting it is only possible for the Syndicate to export a small quantity, and it is even stated that it has so far been impossible to export the tonnage represented by the contract entered into for the delivery of 25,000 tons to England, as no railway rolling-stock is available for the ports of shipment, and no improvement in this respect is expected in the immediate future.

BRITISH OVERSEAS CHEMICAL TRADE IN 1918.

(Concluded from page 478.)

WE give below extracts from the annual statement of the trade of the United Kingdom with foreign countries and British Possessions in 1918, compiled by the Customs and Excise Department. The figures relating to the chemical and allied trades will be found much more useful than those given in the monthly Board of Trade returns, owing to the detailed analysis of the countries of origin of imported, and the destinations of exported, chemical products. Each product is specified separately, together with the extent of the trade done with the more important countries, the corresponding figures for 1917 being in parentheses.

EXPORTS.

Candles.—Netherlands, 2cwt. (45cwt.); Belgium, 652cwt. (974cwt.); France, 7,853cwt. (57,165cwt.); Portugal, 717cwt. (1,334cwt.); Portuguese East Africa, — (293cwt.); Canary Islands, 400cwt. (589cwt.); Spanish North Africa, 580cwt. (7,967cwt.); Morocco, 1,478cwt. (43,510cwt.); Costa Rica, — (32cwt.); Ecuador, 565cwt. (9,714cwt.); Peru, 859cwt. (4,163cwt.); Chili, 51cwt. (849cwt.); Bolivia, 165cwt. (2,453cwt.); Argentine Republic, 1,423cwt. (10,564cwt.); other foreign countries, 2,543cwt. (14,540cwt.); Channel Islands, 1,603cwt. (2,805cwt.); Gibraltar, 328cwt. (729cwt.); British West Africa, 3,327cwt. (10,754cwt.); Cape of Good Hope, 76cwt. (155cwt.); Bombay (including Karachi), 178cwt. (1,329cwt.); Madras, 427cwt. (265cwt.); Bengal, Assam, Bihar, and Orissa, 8cwt. (592cwt.); Burmah, 16cwt. (439cwt.); New Zealand, 208cwt. (2,779cwt.); British West Indies, 146cwt. (778cwt.); other British Possessions, 2,294cwt. (6,520cwt.); total, 25,899cwt. (181,337cwt.).

Glue, Size, and Gelatine.—Sweden, 26cwt. (633cwt.); Norway, 40cwt. (1,086cwt.); Netherlands, — (976cwt.); Belgium, — (1cwt.); France, 2,129cwt. (1,457cwt.); China, 804cwt. (2,870cwt.); Japan, 586cwt. (1,314cwt.); United States, 1,425cwt. (33,639cwt.); other foreign countries, 1,375cwt. (8,515cwt.); Cape of Good Hope, 1,240cwt. (2,933cwt.); British East Indies, 965cwt. (10,552cwt.); Australia, 3,822cwt. (7,611cwt.); New Zealand, 212cwt. (671cwt.); Canada, 2,375cwt. (33,011cwt.); other British Possessions, 3,210cwt. (5,820cwt.); total, 18,209cwt. (111,089cwt.).

Basic Slag.—Channel Islands, 1,065 tons (519 tons); Cape of Good Hope, — (350 tons); Ceylon, — (319 tons); British Guiana, — (380 tons); other British Possessions, — (253 tons); total, 1,065 tons (1,825 tons).

Sulphate of Ammonia.—Sweden, — (300 tons); Norway, — (13,826 tons); Netherlands, — (3,589 tons); Java, — (6,480 tons); Belgium, 343 tons (235 tons); France, 7,693 tons (12,159 tons); French West Indies, — (300 tons); Portugal, 251 tons (697 tons); Spain, — (4,945 tons); Canary Islands, — (85 tons); Italy, 3,351 tons (1,004 tons); Japan, — (4,050 tons); United States, — (1,513 tons); Cuba, — (200 tons); other foreign countries, 10 tons (5 tons); Channel Islands, 974 tons (302 tons); Mauritius, 657 tons (4,208 tons); Ceylon, — (390 tons); Hong Kong, — (244 tons); British West Indies, 2,653 tons (2,470 tons); British Guiana, 2,950 tons (4,258 tons); other British Possessions,

268 tons (1,671 tons); total, 19,150 tons (62,931 tons).

Superphosphates.—Channel Islands, 2,544 tons (2,433); Cape of Good Hope, — (700 tons); Natal, — (71 tons); other British Possessions, 3 tons (—); total, 2,547 tons (3,204 tons).

Manures, Unenumerated.—Norway, — (12 tons); Netherlands, — (2,901 tons); Belgium, 80 tons (—); France, 25,178 tons (5,996 tons); French West Indies, — (886 tons); Portugal, — (1,257 tons); Spain, 2 tons (15 tons); Italy, 1,100 tons (123 tons); United States, 746 tons (5,071 tons); other foreign countries, 100 tons (30 tons); Channel Islands, 8,484 tons (8,020 tons); Natal, 5 tons (63 tons); Mauritius, 150 tons (274 tons); Ceylon, — (406 tons); New Zealand, 1 ton (3 tons); Canada, — (29 tons); British West Indies, 1,338 tons (1,735 tons); British Guiana, 97 tons (135 tons); other British Possessions, 46 tons (433 tons); total, 37,327 tons (27,389 tons).

Methylic Alcohol.—France, — (9,656 gallons); other foreign countries, 5,306 gallons (6,769 gallons); British Possessions, 498 gallons (911 gallons); total, 5,804 gallons (17,336 gallons).

Barytes.—Russia, — (2,170cwt.); France, 22,445cwt. (46,327cwt.); United States, 6,000cwt. (13,600cwt.); other foreign countries, 1,858cwt. (7,864cwt.); British Possessions, 1,066cwt. (5,159cwt.); total, 31,369cwt. (75,120cwt.).

White Lead.—Russia, — (8,446cwt.); Denmark, — (440cwt.); Netherlands, 20cwt. (100cwt.); France, 16,200cwt. (5,294cwt.); Portuguese East Africa, 43cwt. (153cwt.); China, 70cwt. (1,341cwt.); United States, — (185cwt.); Uruguay, 5cwt. (247cwt.); Argentine Republic, 10cwt. (3,995cwt.); other foreign countries, 320cwt. (4,355cwt.); Cape of Good Hope, 854cwt. (3,114cwt.); Natal, 341cwt. (2,307cwt.); Transvaal, 128cwt. (1,909cwt.); Bombay (including Karachi), 2,113cwt. (10,150cwt.); Madras, 4cwt. (217cwt.); Bengal, Assam, Bihar, and Orissa, 743cwt. (9,630cwt.); Burmah, 37cwt. (2,442cwt.); West Australia, — (1,330cwt.); South Australia, — (2,171cwt.); Victoria, 200cwt. (9,548cwt.); New South Wales, 1,031cwt. (14,365cwt.); Queensland, — (5,636cwt.); Tasmania, — (284cwt.); New Zealand, 390cwt. (11,040cwt.); Canada, — (119cwt.); other British Possessions, 1,455cwt. (5,890cwt.); total, 23,964cwt. (104,708cwt.).

Zinc Oxide.—Russia, — (567cwt.); France, 520cwt. (2,720cwt.); Philippine Islands, — (87cwt.); Peru, — (782cwt.); Chili, 78cwt. (1,904cwt.); Brazil, 111cwt. (6,059cwt.); other foreign countries, 982cwt. (2,393cwt.); British India, 328cwt. (2,671cwt.); Straits Settlements, 126cwt. (619cwt.); Australia, 145cwt. (332cwt.); Canada, 11cwt. (23cwt.); other British Possessions, 957cwt. (1,702cwt.); total, 3,258cwt. (19,859cwt.).

Painters' Colours and Materials, Unenumerated.—Russia, — (15,092cwt.); Sweden, 485cwt. (3,927cwt.); Norway, 3,048cwt. (9,304cwt.); Denmark, 574cwt. (8,219cwt.); Netherlands, 272cwt. (8,974cwt.); France, 67,575cwt. (79,408cwt.); Portugal, 12,100cwt. (18,887cwt.); Spain, 6,739cwt. (22,341cwt.); Italy, 3,438cwt. (11,554cwt.); Turkey, 59cwt. (82cwt.); China, 6,870cwt. (25,654cwt.); Japan, 4,537cwt. (19,239cwt.); United States, 23,314cwt. (47,691cwt.); Philippine Islands, 2,252cwt. (6,963cwt.); Cuba, 597cwt. (4,183cwt.); Peru, 3,543cwt. (12,140cwt.); Chili, 8,415cwt. (36,534cwt.); Brazil, 16,442cwt. (34,881cwt.); Uruguay, 1,875cwt. (4,766cwt.); Argentine Republic, 18,923cwt. (41,933cwt.); other foreign countries,

19,588cwt. (41,906cwt.); Egypt, 22,396cwt. (28,363cwt.); Cape of Good Hope, 27,487cwt. (39,674cwt.); Natal, 13,070cwt. (20,790cwt.); Transvaal, 5,866cwt. (11,393cwt.); Bombay (including Karachi), 41,247cwt. (95,879cwt.); Madras, 3,132cwt. (8,480cwt.); Bengal, Assam, Bihar, and Orissa, 23,831cwt. (61,612cwt.); Burmah, 6,216cwt. (15,964cwt.); Straits Settlements, 12,680cwt. (26,294cwt.); Ceylon, 4,714cwt. (14,359cwt.); Hong Kong, 10,198cwt. (20,732cwt.); West Australia, 643cwt. (1,719cwt.); South Australia, 1,596cwt. (4,108cwt.); Victoria, 8,914cwt. (17,461cwt.); New South Wales, 8,818cwt. (26,918cwt.); Queensland, 1,518cwt. (2,583cwt.); Tasmania, 131cwt. (844cwt.); New Zealand, 7,646cwt. (24,850cwt.); Canada, 2,625cwt. (11,036cwt.); British West Indies, 3,414cwt. (7,275cwt.); other British Possessions, 21,848cwt. (46,852cwt.); total, 428,636cwt. (940,864cwt.).

Salt, Rock and White (except Table Salt).—Sweden, — (2,230 tons); Norway, 49,855 tons (58,343 tons); Denmark, 4,819 tons (4,139 tons); Iceland and Greenland, 7,328 tons (9,381 tons); German West Africa, 7,165 tons (3,590 tons); Netherlands, 2,177 tons (14,863 tons); Belgium, 134 tons (—); Belgian Congo, 4,824 tons (6,905 tons); France, 8,264 tons (6,159 tons); French West Africa, 9,053 tons (7,916 tons); United States, 17,743 tons (15,581 tons); Brazil, 8,931 tons (6,677 tons); other foreign countries, 9,270 tons (7,247 tons); British West Africa, 48,059 tons (56,619 tons); Bombay (including Karachi), 280 tons (102 tons); Madras, — (3 tons); Bengal, Assam, Bihar, and Orissa, 18,878 tons (26,839 tons); Burmah, 35 tons (10,982 tons); West Australia, 10 tons (186 tons); South Australia, 41 tons (54 tons); Victoria, 29 tons (75 tons); New South Wales, 430 tons (1,722 tons); Queensland, 24 tons (63 tons); New Zealand, 9,316 tons (9,232 tons); Canada, 29,714 tons (38,484 tons); British West Indies, 6,337 tons (7,607 tons); other British Possessions, 12,556 tons (5,709 tons); total, 255,272 tons (300,708 tons).

Soft Soap.—France, 16,750cwt. (60,419cwt.); other foreign countries, 5,130cwt. (8,552cwt.); British Possessions, 7,476cwt. (12,265cwt.); total, 29,356cwt. (81,236cwt.).

Household and Laundry Soap.—Norway, 1,826cwt. (15,275cwt.); Netherlands, 104cwt. (109,252cwt.); Dutch Indies, 33,930cwt. (135,832cwt.); France, 105,307cwt. (448,634cwt.); Algeria, 18,057cwt. (54,763cwt.); French West Africa, 11,868cwt. (13,199cwt.); Madagascar, 10,791cwt. (7,250cwt.); Spain, 6,371cwt. (4,174cwt.); Canary Islands, 1,312cwt. (5,025cwt.); Spanish North Africa, 10,745cwt. (10,157cwt.); Italy, 87,599cwt. (149,725cwt.); Turkey, 2,088cwt. (1,922cwt.); Tunis, 10,648cwt. (5,446cwt.); Morocco, 41,435cwt. (24,231cwt.); Siam, 15,840cwt. (18,529cwt.); China, 67,119cwt. (156,025cwt.); Philippine Islands, 2,075cwt. (21,226cwt.); Panama, 8,245cwt. (19,482cwt.); Ecuador, 6,208cwt. (4,108cwt.); Peru, 9,962cwt. (13,247cwt.); Chili, 14,894cwt. (20,873cwt.); Brazil, 3,681cwt. (7,044cwt.); Argentine Republic, 17,119cwt. (16,012cwt.); other foreign countries, 96,513cwt. (80,305cwt.); Gibraltar, 19,049cwt. (20,356cwt.); Malta and Gozo, 30,749cwt. (8,315cwt.); Cyprus, 12,220cwt. (5,016cwt.); Egypt, 72,325cwt. (63,097cwt.); Gold Coast, 32,960cwt. (46,739cwt.); Nigeria, 56,345cwt. (81,628cwt.); Cape of Good Hope, 561cwt. (3,686cwt.); Natal, 178cwt. (414cwt.); British East Africa, 25,165cwt. (29,580cwt.); Mauritius, 18,310cwt. (18,929cwt.); Bombay (including Karachi), 109,787cwt. (190,623cwt.);

Madras, 19,206cwt. (36,119cwt.); Bengal, Assam, Bihar, and Orissa, 26,205cwt. (45,509cwt.); Burmah, 23,873cwt. (100,851cwt.); Straits Settlements, 74,515cwt. (82,997cwt.); Hong Kong, 26,485cwt. (38,231cwt.); British West Indies, 74,617cwt. (109,824cwt.); British Guiana, 24,064cwt. (23,406cwt.); other British Possessions, 60,744cwt. (77,878cwt.); total, 1,291,095cwt. (2,324,934cwt.).

Polishing and Scouring Soap.—Foreign countries, 1,512cwt. (4,124cwt.); British Possessions, 3,733cwt. (3,780cwt.); total, 5,245cwt. (7,904cwt.).

Soap Powder.—Foreign countries, 3,324cwt. (7,626cwt.); British South Africa, 4,432cwt. (6,189cwt.); Australia, 11cwt. (23cwt.); New Zealand, 1,673cwt. (4,557cwt.); other British Possessions, 1,355cwt. (2,383cwt.); total, 10,795cwt. (20,778cwt.).

Toilet Soap.—Java, 5,649cwt. (7,823cwt.); Belgium, 255cwt. (379cwt.); France, 5,905cwt. (12,077cwt.); Italy, 738cwt. (1,531cwt.); China, 1,261cwt. (4,254cwt.); Japan, 761cwt. (873cwt.); United States, 519cwt. (1,866cwt.); Brazil, 292cwt. (200cwt.); Argentine Republic, 604cwt. (1,160cwt.); other foreign countries, 7,476cwt. (15,399cwt.); Egypt, 7,911cwt. (4,727cwt.); Cape of Good Hope, 1,189cwt. (1,713cwt.); Natal, 1,884cwt. (2,348cwt.); Transvaal, 432cwt. (696cwt.); Bombay (including Karachi), 13,662cwt. (12,240cwt.); Madras, 1,705cwt. (1,986cwt.); Bengal, Assam, Bihar, and Orissa, 5,088cwt. (4,978cwt.); Burmah, 1,693cwt. (4,089cwt.); Straits Settlements, 1,162cwt. (962cwt.); Ceylon, 1,080cwt. (1,541cwt.); Australia, 1,536cwt. (3,456cwt.); New Zealand, 2,493cwt. (3,104cwt.); Canada, 837cwt. (1,045cwt.); other British Possessions, 7,899cwt. (9,729cwt.); total, 72,031cwt. (98,176cwt.).

Soap, Unenumerated (including Cottonseed Oil Soap).—Foreign countries, 3,076cwt. (1,422cwt.); British Possessions, 1,348cwt. (2,035cwt.); total, 4,424cwt. (3,457cwt.).

Spirits, British and Irish, Methylated.—Foreign countries, 3,468 proof gallons (1,185 gallons); British Possessions, 3,616 gallons (8,312 gallons); total, 7,084 gallons (9,497 gallons).

TURPENTINE CONTROL.

IN reference to the following Order made by the Minister of Munitions, namely:—The Turpentine, etc., Control Order, 1918, dated January 25, 1918, which was by the Turpentine, etc., Control (Partial Suspension) Order, 1919, dated March 18, 1919, suspended until further notice except in so far as related to turpentine substitute as defined in the said Order, the Minister of Munitions hereby orders as follows:—

(1.) The operation of the Turpentine, etc., Control Order, 1918, is hereby suspended on and after November 1, 1919, until further notice in so far as relates to turpentine substitute as defined in the said Order—namely, mineral turpentine, white spirit, white oil, or any product of petroleum under whatever name sold or known (except motor spirit and benzene) capable of being used as a substitute for spirits of turpentine.

(2.) Such suspension shall not affect the previous operation of the said Order or the validity of any action taken thereunder or the liability to any penalty or punishment in respect of any contravention or failure to comply with the said Order prior to such suspension or any proceedings in respect of such penalty or punishment.

(3.) This Order may be cited as the Turpentine, etc., Control (Complete Suspension) Order, 1919.

ITEMS OF INTEREST.

CHINA CLAY DEVELOPMENT WORK.—Dr. Malcolm McLaren has been engaged by Tehidy Minerals, Ltd., to make a detailed examination of their china clay areas and deposits, with a view to their exploitation on a large scale.

NEW CAPITAL ISSUES.—The Board of Trade, acting on behalf of the Treasury, has granted a general licence, under the Defence of the Realm Regulation 30F, permitting issues of capital for which a licence from the Treasury is required under that regulation.

NATIONAL UNION OF SCIENTIFIC WORKERS.—Dr. Evans, F.R.S., Dr. Norman Campbell, and Mr. Eric Campbell were elected president, treasurer, and secretary respectively of the National Union of Scientific Workers at the annual council meeting of that body on Saturday last.

AIRCRAFT SUB-COMMITTEE ON CHEMICALS.—Mr. Hugh Griffiths, B.Sc., A.R.C.Sc., 15, New Bridge Street, London, E.C.4., has been elected as the British Chemical Trade Association's representative to the "Aircraft Sub-Committee on Chemicals" of the British Engineering Standards Association.

ZINC AND ZINC DUST PRICES.—The price of Australian high-grade zinc dust (88.92 per cent. metallic zinc) is maintained at £75. per ton. Australian electrolytic zinc (99.95 per cent. purity) is unchanged at £42. per ton, f.o.b. Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

NEW ZEALAND IMPORTATION OF SACCHARIN.—Under an Order-in-Council of August 19, the importation is prohibited into the Dominion of New Zealand, except with the consent of the Minister of Customs, of saccharin which has not been manufactured or produced in some part of the British Dominions.

MALAY TIN EXPORTS.—The export of tin from the Federated Malay States in October amounted to 3,221 tons, as against 3,161 tons in September and 2,870 tons in the corresponding month last year. The total for ten months amounted to 31,482 tons, compared with 31,206 tons in 1918 and 33,008 tons in 1917.

BUSINESS NOTICE.—Messrs. Pemberton, Pollard and Co., of St. Bartholomew's House, Fleet Street, E.C., inform us that owing to the increase of their chemical business they have turned the business into a limited liability company under the name of Pemberton, Ansell and Co. Limited, with a nominal capital of £5,000.

GEOLOGICAL SURVEY.—The Geological Survey of Great Britain and Museum of Practical Geology, Jermyn Street, S.W., have been transferred for administrative purposes from the Board of Education to the Department of Scientific and Industrial Research as from November 1. Correspondence with reference to the work of the Survey should be addressed as heretofore to the Director of the Survey and Museum, Jermyn Street, S.W.

ABERDEEN AND THE CHEMICAL TRADE.—Aberdeen Chamber of Commerce have started the issue of a new official monthly organ, and in the first number reference is made to the local chemical industry. It is stated that Aberdeen being the centre for a large and important agricultural district, superphosphates and other chemical fertilisers are manufactured locally to a very considerable extent by several firms; while it is also mentioned that one of these firms manufactures coal-tar products and sulphate of ammonia from the residual products of various gasworks in the districts, while they also make sulphuric acid as well as superphosphates and other fertilisers.

IMPORT AND EXPORT LICENCES.—The Export Licence Department has now removed from 1, Queen Anne's Gate Buildings, S.W.1, and has been amalgamated with the Department of Import Restrictions at 22, Carlisle Place, S.W. 1. The combined Department will be under the charge of the Assistant Secretary, Industries and Manufactures Department, Board of Trade. Applications for licences in respect of all commodities (with the exceptions stated below) and all inquiries relating thereto should be addressed to the Director, Imports and Exports Licensing Section, Board of Trade, 22, Carlisle Place, S.W. 1. Applications for licences for the import of dye-stuffs should be addressed, as hitherto, to the Secretary, Trade and Licensing Sub-committee, Danlee Buildings, Spring Gardens, Manchester; and for licences for the export of coal to the Controller, Coal Mines Department, Holborn Viaduct Hotel, E.C.1.

CONTROLLED ESTABLISHMENTS.—The *London Gazette* publishes an Order of the Ministry of Munitions revoking all Orders made in pursuance of Section 4 of the Munitions of War Act, 1915, and Section 1 of the Munitions of War (Amendment) Act, 1916, declaring that the establishments specified in the said Orders were controlled establishments under the provision of the Acts.

IMPORTATION OF NON-BRITISH DYES INTO STRAITS SETTLEMENTS PROHIBITED.—The Straits Settlements Government *Gazette* of September 16 contains copy of a Government Notification, No. 1406, of that date, stating that the importation into the colony of dyes not manufactured in the British Empire is prohibited, unless a licence has first been obtained from the Governor and the importation is in accordance with the provisions of such licence.

CHEMICAL WORKERS' WAGES.—Further wages advances awarded by the Court of Arbitration were announced on Friday of last week. Salt and chemical trade workers aged eighteen and over are to receive an increase of 5s. a week, based on a week of six days or six shifts. The claim was for 15s. By consent of both parties, claims for the consolidation of all war bonuses and percentages into wages, and the establishment of a forty-four-hour week for all workers, were withdrawn at the hearing.

RADIUM IN CANADA.—*Reuter's* Toronto correspondent states that pitchblende has been found in the township of Butt, in the Nipissing district. An assay made by New York experts showed the pitchblende to be unusually rich in uranium. According to the Provincial Department of Mines, this is the second occurrence of radium bearing mineral reported to the Canadian Bureau of Mines since the Ontario Legislature offered a reward of 25,000 dollars for the discovery of radium in Ontario in commercially useful quantities.

WORKERS' WELFARE IN THE GALVANISING TRADE.—The Home Secretary gives notice that, in pursuance of the powers conferred on him by Section 7 of the Police, Factories, Etc. (Miscellaneous Provisions) Act, 1916, of making orders for securing the welfare of the workers employed in factories or workshops, he proposes to make an order to apply to all factories and workshops in which is carried on the process of galvanising. Copies of the draft order and the notice may be obtained on application to the Home Office, Whitehall, London, S.W. 1.

PHYSICAL CHEMISTRY AT CAMBRIDGE.—The Council of the Senate of Cambridge University, while putting forward on Tuesday a grace for the appointment of a syndicate to consider the allocation and the administration of the benefaction of the British oil companies, gave the opinion, after consultation with Professor Sir W. J. Pope, that it was desirable, in the interests of the Department of Chemistry, to take steps at once for the establishment of a professorship of physical chemistry, the stipend of which would be furnished out of the benefaction. The stipend suggested is £1,000. The Council recommended accordingly.

A NEW FERRO-ALLOY.—The Shawinigan Electro-Products Co., Baltimore, has produced a new ferro-alloy containing silicon and aluminium. The process of manufacture, which is by the electric furnace, allows the relative proportions of silicon and aluminium to be varied to any desirable extent, as long as the silicon content remains near 50 per cent. This alloy is intended for use in steel making, as a deoxidising agent. The combination is said to provide silicon and aluminium at a lower price than they can be obtained separately. A number of steel makers are now experimenting with this alloy.—*Technical Review*.

JAPANESE CELLULOSE INDUSTRY.—According to the Japanese Press, the following developments are taking place in the cellulose industry: Several Japanese business men have been asked to join in promoting a concern for the amalgamation of the 130 small cellulose works in Tokyo, the new concern to be capitalised at yen 2,000,000. A prominent Japanese factory owner has proposed the formation of a concern to be capitalised at yen 12,500,000, which is to amalgamate the present factory owned by him and the Sakai and Aboshi factories, the capital to be increased to yen 15,000,000 if and as necessary. This scheme will be extended to cover all the factories in the country. Another version of the preceding is that eight large concerns are to amalgamate shortly. The capital of the joint concern is to be yen 12,500,000. The joint concern is to be called the "Dai Nippon Seruroido Kabushiki Kaisha" (Great Japan Celluloid Company).

CHINESE INDIGO.—A large production of liquid indigo is expected in China this year. Owing to the very poor 1918 crop greater acreage was devoted to indigo plants. The crop, which is said to be an average good one, was chiefly affected by excessive rain in certain low-lying districts early in the season.

DIRECTOR OF COTTON RESEARCH.—Dr. W. A. Crossley, professor of chemistry at King's College, London, has been appointed director of research by the British Cotton Industry Research Association. Dr. Crossley is a doctor of science of Manchester University, and a doctor of physics of Würzburg. He was at one time professor of chemistry and practical research in the laboratory of the Pharmaceutical Society. He took up the appointment at King's College in 1914, but it was in abeyance during the war and he became commandant and superintendent of experiments at the R.E. experimental station at Porton with the rank of Lieutenant-Colonel.

PARAFFIN WAX DISCOVERY.—Investigations of a deposit of solid paraffin wax found in Lancashire coal have been explained to the Manchester Geological and Mining Society. Captain F. S. Sinnatt and Mr. Barash have conducted the inquiries, and the former, in reading his paper, said that the deposit was one of the most valuable compounds in the world. The substance was found in the Arley mine of the Garswood Hall Colliery Company, Bryn, 33 years ago. At a depth of 440 yards down the No. 2 pit the workings extended in a southerly direction for about seven hundred yards, and amongst several "faults" were some tons of this substance in the coal. It was treated as waste product, except for the sample investigated, which probably survived as a curiosity. Two years ago the tests were started, and the substance was declared to be unchanged. The ordinary paraffin wax melts at about 40° C. The example found in the Lancashire coal pit melts at about 93°, and it is this factor that makes the compound so valuable.

WOOD PRESERVATION.—In a paper on the "Preservation of Mine Timber," read before the Manchester Geological and Mining Society, Mr. N. T. Williams gave the following figures as to the relative costs of various processes:—The open tank treatment with creosote worked out approximately at 2d. per cubic foot; the brush treatment at 3d. per cubic foot; and the cylinder treatment under pressure at 7½d. for 10lb. of creosote per cubic foot. That system of treating timber would, the author said, be very expensive for collieries, and the open tank process would be the most suitable. The treatment with zinc chloride would be much cheaper—about a third of the cost with creosote. Mr. Williams said that he had never known an instance of brittleness being due to the treatment of the timber, unless it is subjected to a high temperature. If care is taken that the oil in the course of boiling does not exceed a temperature of 220° F., the tests for bending and for compression seem to work out fairly well. The treated timber is usually about 10 per cent. weaker than the untreated wood.

THE ROYAL SOCIETY AWARDS.—The King has been pleased to approve of the following awards this year by the President and Council of the Royal Society:—A Royal Medal to Professor J. B. Farmer, F.R.S., for his notable work on plant and animal cytology. A Royal Medal to Mr. J. H. Jeans, F.R.S., for his researches in applied mathematics. The following awards have also been made by the President and Council:—The Copley Medal to Professor W. M. Bayliss, F.R.S., for his contributions to general physiology and to bio-physics. The Davy Medal to Professor P. F. Frankland, F.R.S., for his distinguished work in chemistry, especially that on optical activity and on fermentation. The Sylvester Medal to Major P. A. MacMahon, for his researches in pure mathematics, especially in connection with the partition of numbers and analysis. The Hughes Medal to Dr. C. Chree, F.R.S., for his researches on terrestrial magnetism. The following is a list of those recommended by the President and Council of the Royal Society for election to the Council at the anniversary meeting on December 1:—President: Sir J. J. Thomson, O.M., M.A., D.Sc., LL.D. Treasurer: Sir David Prain, C.M.G., C.I.E. Secretaries: Mr. W. B. Hardy, M.A., and Mr. J. H. Jeans, M.A. Foreign Secretary: Professor W. A. Herdman, D.Sc. Other members of the Council: Mr. J. Barcroft, C.B.E., Mr. C. V. Boys, Sir J. J. Dobbie, LL.D., Sir F. Dyson, M.A., Professor J. B. Farmer, M.A., Sir W. M. Fletcher, K.B.E., Professor F. W. Gamble, D.Sc., Sir R. T. Glazebrook, M.A., C.B., Professor J. W. Gregory, D.Sc., A. C. Haddon, Sc.D., Sir R. A. Hadfield, Bt., Sir A. B. Kempe, M.A., Sir W. J. Pope, M.Sc., K.B.E., S. H. C. Martin, M.D., Professor A. Schuster, Sc.D., Professor W. P. Wynne, D.Sc.

SODIUM CARBONATE MANUFACTURE IN CANADA.—Glass manufacturers in Canada have been largely dependent in the past upon the United States for their supplies of glass sand and sodium carbonate. However, according to the United States Bureau of Mines Report, the new plant at Amherstburg, Ontario, Canada, at which sodium carbonate is to be made by the Solvay process, is expected to supply all of Canada's needs for soda ash. The capacity of this plant is reported to be about 120 tons per day. Some glass sand is being secured from Oneida, Ontario, but it is said to be of an inferior grade, and only suitable for the manufacture of the cheaper grades of glassware.—*Board of Trade Journal.*

A BENEFICIAL ALKALI CONTRACT.—While in its financial aspect the deal for £4,000,000. with Lever Brothers is certainly one of considerable advantage to Brunner, Mond and Company, that company, says *The Financier*, will greatly benefit under a revised agreement relating to the supply of alkali for the soap-making requirements of Lever Brothers. The contract current during the war period under which Brunner, Mond and Company supplied alkali to Lever Brothers fixed a price which, in the abnormal condition then prevailing, was not remunerative, but we learn from unofficial sources, says our contemporary, that the revised agreement is very much more favourable to Brunner, Mond and Company, inasmuch as not only will it ensure satisfactory profit henceforth, but, being made retrospective, will recoup the company for war losses it may have sustained under the prior contract. Thus industrially, as well as financially, the deal with Lever Brothers is a very advantageous one for Brunner, Mond and Company, as will be fully realised once the significance of the agreements is understood.

DENMARK AND BRITISH CHINA CLAY.—H.M. Commercial Secretary at Copenhagen states that, owing to the cessation of export of British china clay during the war, Danish purchasers were subjected to great inconvenience and to considerable losses. One firm had several ships in England at the time of the prohibition, one of which was detained for over a year, although loaded. This represented a considerable pecuniary loss to the firm in question. As substitutes for the British clay, Swedish, Danish, and German clays were used, and, further, synthetic clay was produced by grinding and mixing certain ingredients. It is understood that the synthetic clay was not always reliable, as it was impossible to obtain the same consistency as in the natural clay, and when subjected to the high temperature of the furnaces a greater percentage of breakages occurred. Some firms have already received cargoes of British china clay since the Armistice, and it is considered that for the finest porcelain the British clay will supersede the synthetic product. It is considered, however, that the Swedish, Danish, and German clays (particularly a quality coming from Chemnitz), which are quite good for certain purposes, will find a considerable market in Denmark, unless the price of British clay becomes competitive again.

THIRTY YEARS AGO.

From the "Chemical Trade Journal" of November 16, 1889.

The Alkali Trade.—The zealous endeavour which has lately been made to revive the moribund Bleaching Powder Association in a new form has not been successful. At a meeting held in Liverpool on Thursday this week, the Chairman (Mr. Brock) had to confess with apparent sorrow that the committee had been unable to patch up the differences which had arisen, and that the proposal to unite upon a new basis of 25 per cent. reduction in the decomposition of salt all round had also failed. Therefore the Bleach Association, and with it the Acid Association, have become null and void. Both the manufacture and the market are now unmuzzled, and both combinations are practically at an end.

The Output of Coal.—The *Bulletin*, published by the Ministry of Public Works in France, contains an estimate of the total amount of coal extracted in the principal countries of Europe and in the United States during the year 1887. Great Britain and Ireland, of course, come first, with an output of nearly 165,000,000 tons, the cost price of which, at the pit's mouth, is put at a fraction over 4s. per ton. The United States come next, with an output of 118,000,000 tons, calculated at a cost price of 6s. 6d. per ton. Then follows Germany, with an output of 76,000,000 tons, estimated at a cost price of rather over 5s. a ton; followed by France, with an output of 21,000,000 tons, the cost price of which is no less than 8s. 6d. per ton.

LEGAL INTELLIGENCE.

Sir Alfred Mond's Libel Action.

A series of cases was in the list before Mr. Justice Lush at Glamorgan Assizes, in which Sir Alfred Mond and his brother, Mr. Robert Mond, chairman of the Mond Nickel Company, were concerned. In the first two cases Mr. Robert Mond and Sir Alfred Mond each claimed damages for libel, and an injunction against Mr. W. F. Brooks, a surgeon of Swansea, in respect of a speech made during the election last November. In view of the fact that the defendant had apologised, Sir Edward Carson, for the plaintiffs, intimated that there would be no need to swear in a jury. Sir Edward Carson explained that at a public meeting at Swansea the defendant alleged that Mr. Robert Mond was doing his best to get a German reinstated in a position at the Cape Copper Works, Swansea, from which he had been removed owing to the protests of the workmen. Defendant's comment on this alleged fact was, "Unless we get rid of this German influence in this country, in spite of the fact that thousands of our fellow-countrymen have been sacrificed, we have lost the war." Defendant spoke of the Mond Nickel Company trying to oust a Briton in favour of a "damned German," and concluded, "The leopard cannot change his spots nor the Ethiopian his skin, still less a German." Sir Edward Carson added that the action was brought not for money, but to vindicate character. Defendant had found the allegation was absolutely without foundation, and was prepared to make an apology, which plaintiffs would accept. Defendant would pay the costs of the action. Mr. Robert Mond having given evidence totally denying the truth of the allegation, counsel for the defendant acquiesced in the statement of Sir Edward Carson, adding that his client had spoken the words in good faith, believing them to be true.

In the course of the proceedings, Lord Moulton, head of the High Explosives Department, gave evidence. Examined by Sir Edward Carson, witness said that the first time he came in contact with Sir Alfred Mond was when Sir Alfred visited him at his Department, quite unsolicited, and told him that Brunner, Mond and Co., Ltd., were prepared to do everything they could for the Department, and that he (witness) might consider the whole of the company's resources at his disposal.

Sir Edward Carson: After that, were the whole resources of the company placed at your disposal?

Lord Moulton: Oh, yes. The next thing that happened was that the two technical directors, and I think the chemist and the engineer of the company, came to see me to ascertain what they could do. At the moment I had nothing for them, because the work I was doing was not at all suited to their work. The important moment, as far as high explosives were concerned, was when the War Office were persuaded to abandon the idea of using only T.N.T. and lyddite as high explosives and to accept mixtures with nitrate of ammonia. When I came to work out the resources that I had I found it would have been absolutely impossible to supply high explosives in sufficient quantities for the extent I saw the war was going to be unless this new type of explosive was adopted. Nitrate of ammonia was not being made in England at all. I could get a certain amount of nitrate of lime from Norway, where it was made electrically, and the first thing I asked Brunner, Mond to do was to undertake the conversion of this nitrate of lime into nitrate of ammonia. They did so at their works. Very soon the quantities which had looked so big, and which I could get from Norway, proved too small for the demand, and then Brunner, Mond set to work to find out another method to manufacture it direct. They worked out a most effective and ingenious method along the lines of the ammonia-soda processes which they worked so very largely. That was the great technical difficulty, but it stood by me all through the war. But in a month or two it was evident it must be supplemented. Brunner, Mond then worked out a very ingenious method which we worked on a very large scale, taking one of their works and a considerable part of another, and that for a long time satisfied the big demand. It was a demand which grew to hundreds of tons a day, and hundreds of tons a day is not easy to get manufactured. Throughout the whole of their technical staff worked on every problem that I put before them, and I cannot see how it would have been possible to get the enormous supplies of nitrate of ammonia which we required in any other way than by these methods. They finished at the end by inventing by far the best way of all. So good was it that we erected a very large factory—a factory which, were it completed and worked out to the full, would have given us 2,000 tons a week. It was

a new and direct process that was built under their supervision and from plans drawn up by their engineer. The difficulties were very great, because the salt is a most troublesome one. The solution of it is very strong and has unpleasant properties, and we had to learn that by experience, and it required a great deal of patience and continual work to get these various processes into practical work, because it was not a question of the laboratory—it was the very opposite extreme, it was production wholesale.

Sir Edward Carson: Then, I suppose, I may take it from that, Lord Moulton, that the work done by Brunner, Mond had a great effect on the necessary productions for the war? —Oh, yes; the whole of that side of the manufacture was practically in their hands. I should think they did four-fifths of it. When they manufactured so largely nitrate of lime by their second processes they had to convert it themselves into the nitrate of ammonia, and I was obliged to allow what we had from Norway to go to another firm to be converted. But the bulk of the manufacture always remained in their hands.

During that time was Sir Alfred Mond loyally doing his best for the country in every respect?—Indeed he was, and the whole of the directors. It was so deliberately the policy of the company that the directors had not to be even formally consulted when it was wanted. It was done as a matter of course, and I used to go down myself almost every two weeks. I could not possibly have had a more wholehearted support from any company.

Were you acquainted with Dr. Ludwig Mond?—Oh! yes. He was not only a very good scientific man himself, but he had in almost the largest measure that I ever knew the power of industrial production on scientific lines. The process which has made the fortune of the company, the ammonia-soda process, was thoroughly understood and quite familiar to chemists. But he worked at it for I am afraid to say how many years until he made it a very great practical success, and he had the same strong bent towards industrial chemistry which certainly was lacking in England. He invented a very remarkable nickel process whereby, I should think for the very first time, it was possible to extract a metal from its ore by means of a gas. It excited the greatest interest at the moment. At one time he was on the managing body of the research laboratory which he gave to the nation.

Were those processes that he invented and the businesses he constructed of great advantage to this nation?—Oh! yes. They kept the soda ash trade and developed it enormously. As for the nickel, I should think they had brought it all to England. Then he did a great deal of work also in the use of gases for gas engines.

So far as you can say, was he a loyal citizen to this country? —Oh! yes, indeed, he was. Such a question in his lifetime would have been too absurd.

Poison-gas Manufacture and Workmen's Compensation.

In the Court of Appeal on Monday, before Lord Justices Warrington and Atkin, and Mr. Justice Eve, the Sneyd Bycars Co., Ltd., appealed from an award of the Judge of the Burslem County Court, sitting as arbitrator under the Workmen's Compensation Act. The workman, Henry Dutton, was employed by the Sneyd Bycars Company, whose undertaking was controlled by the Ministry of Munitions during the war, to manufacture poison gas, and he was incapacitated by gas poisoning on July 5, 1916. At first he continued to receive his full wages, but after about eight weeks he was paid £1. 7s. 11d. a week until March or April, 1917, when he sufficiently recovered to do light work for a colliery company, and he received, in addition to his wages in that employment, half the difference between his wages before he was disabled and his then existing wages. In July, 1918, he again became incapacitated as a result of the poisoning, and he was again paid £1. 7s. 11d. a week until January 8, 1919. Since then he had been paid only 10s. a week, and he began these proceedings claiming compensation under the Act. It was admitted that the workman was suffering from a disease resulting from his employment that was not scheduled to the Act as an industrial disease, but the workman contended that the employers were estopped by their conduct from denying that the case came within the Act. This contention was based on the weekly payments made to the workman since his incapacity, which, apart from the first eight weeks when he received full wages, were until January, 1919, exactly equal in amount to the weekly compensation that would have been payable under the Act with the addition of 7s. a week subsistence money. It was also based on the facts that the workman, as he said, had signed receipts (which were not produced) for composition or compensation under the Act, that he had

also been required to sign about every month a declaration form issued by the Ministry of Munitions, called Munitions Finance Form W.C. 3; and that, latterly, he had had to give a receipt on a form issued by the Ministry, called Ministry Finance Form W.C.A. 3; and that, latterly, he had had to give that the estoppel was established, and he made an award in favour of the workman of £1. 1s. 3d. a week.

Lord Justice Warrington, who delivered judgment, said there was a serious question whether an agreement to pay compensation could be enforced unless it was also recorded under the Act. The operation of the Act was confined to a certain class of cases, and the parties could not by any form of estoppel or by agreement so enlarge the operation of the Act as to bring within it other cases, or to extend the limited statutory jurisdiction in those cases. Of course, if some particular fact alleged by either party was in issue, and either in accordance with the practice of the Court, as in the case of admissions on the pleadings, or by the application of some rule of law, it had to be taken to be as alleged, it would be so taken although the result might not be in accordance with the true state of the facts. The appeal must be allowed and an award made in the employers' favour.

Lord Justice Atkin and Mr. Justice Eve concurred.

Alleged Damage by Picric Acid Fumes.

The Official Referee, Mr. Edward Pollock, resumed in the Civil Court at the Leeds Town Hall, on Tuesday, the hearing of the arbitration case adjourned from last July between Richard Kershaw and Sarah E. Young, executors and trustees of the late Mr. Richard Kershaw, Crow Nest, Lightcliffe, near Halifax, and Messrs. Brooke's Chemicals, Limited. The former claimed damages amounting to £13,400 in respect of the alleged permanent depreciation of the Crow Nest estate owing to fumes and effluent emitted from the defendants' picric acid works in the vicinity.

Mrs. Young, in evidence, said that during the period from March, 1916, when the chemical works were started, to October, 1917, when she left Crow Nest, there was a gradual increase in the density of the fumes which swept across the grounds in whitish-yellow and copper-coloured clouds. The trees were very late in bursting into leaf, and the leaves were shrivelled by the fumes. She and others experienced great physical discomfort, their sensations being rather like those experienced in gas attacks during the war. A white fox-terrier was dyed yellow after running through the grass, and the white legs of cows browsing on the estate were also turned yellow. From a man-hole near the north front of the house white steam was sent up which burnt the grass all round. The water in the lake became orange coloured, all the fish were killed, and a white swan on the lake was tinted yellow. The house, added the witness, was not fit to live in at this time.

Miss A. M. Stearn, the nurse in attendance on the late Mr. Kershaw, said the fumes induced a burning sensation on the chest and smarting eyes. The fumes had a very bad effect upon her late patient, to whom it was necessary to administer stimulants at frequent intervals. When she went into the gardens to gather flowers, her hands were stained yellow.

Further evidence was given on Wednesday when the hearing was adjourned.

Shipment of Potato Starch.

A claim for damages for alleged breach of contract for the shipment of 102 tons of potato starch, came before Mr. Justice Roche in the Commercial Court of the King's Bench Division on Tuesday. The plaintiffs were Messrs. Charles Weis and Co., Ltd., of St. Mary Axe, London, E.C., and the action was brought against Northern Traffic, Ltd., Cannon Street, London.

Plaintiff's case, presented by Mr. Frederick Vanden Berg, was that in the month of March, 1919, defendants verbally contracted with them to ship 102 tons of potato starch direct from London to Paris at a freight of 105s. per ton. The freight was paid by plaintiffs in advance. Defendants, it was alleged, in breach of their contract, shipped the goods to Calais and thence forwarded them overland to Paris. The market rate for shipment of the goods from London to Paris via overland was not more than 80s. per ton, and plaintiffs claimed £127. 10s., the difference between the amount of freight they paid defendants, and the market rate.

Evidence was given for the plaintiffs that it was essential the goods should go by water all the way without transshipment.

Defendants admitted that they agreed to ship the potato starch from London to Paris, but denied that they agreed the shipment should be direct. Evidence was given that the

defendants agreed to give a quick service, but not a direct service, and it was stated that the vessel in question, s.s. *Aegir*, could not go direct to Paris. She was not built for the Paris service.

Mr. A. M. Talbot, for defendants, submitted that plaintiffs had suffered no damage. Plaintiffs got the goods in Paris and got them entirely undamaged, and very rapidly indeed.

His Lordship gave judgment for the plaintiff company for £102. with costs.

Chemical Merchant's Failure.

At the London Bankruptcy Court on Wednesday the first meeting of creditors was held of George Edward Newton, chemical merchant, of 74, Great Tower Street, E.C., and lately residing at 203, St. James's Road, Croydon.

The Official Receiver reported that the debtor commenced business in November, 1916, with a capital of £50., which sum he borrowed. The system of the business appeared to be to first obtain orders and then to purchase the goods. All his transactions were on a cash basis, therefore there was no need for capital. The business was quite a success for the first 18 months, and a profit of £3,000. was made. About June, 1918, owing to various restrictions on exports and the control of chemicals by the Government, profits fell off considerably, and the debtor cut down expenses by getting rid of his staff and managing the business himself; but the business continued to decline, and in November of last year it ceased altogether, when he had to go to moneylenders, the profits on his business having been tied up in stocks and his private house. In March last a moneylender began to press, and he sold his house at Croydon, together with his furniture, in order to pay off some of the claims. He also entered into negotiations to sell the business to a company which would have taken over the liabilities, but the moneylender would not wait, and instituted the present bankruptcy proceedings. The debtor was now acting as manager of the company at a weekly salary. He had not filed a statement of affairs, but he estimated his liabilities at £2,000.; and as regards assets, he had 10 tons of powdered arsenic and 313 tons of special vacuum salt—both of these items had been charged to a bank against loans. He attributed his failure to loss of business through shipping restrictions, control by the Government of chemicals, and stagnation of trade following the Armistice.

In reply to the Official Receiver, debtor said it was his intention to pay his creditors in full, because it was possible a friend would come to his rescue and provide a sum not exceeding £2,500, if bankruptcy could be avoided. But for pressure by a creditor, the bankruptcy proceedings would not have arisen. He was unable to submit a definite offer to the creditors at present.

Eventually it was resolved that Mr. David Hart, accountant, of 12, Regent Street, W., should be appointed trustee of the estate to act in conjunction with a committee of inspection consisting of Mr. E. F. Warriner, Mr. F. Phipps, and Mr. C. W. Granville.

Munitions Official's Theft of Lead.

At the Central Criminal Court on Monday, before the Common Serjeant, the trial was concluded of Albert Evan Whatcott, 29, metal worker, on the indictment charging him with stealing 40 tons of lead, the property of the Ministry of Munitions. The jury found the defendant guilty, and the Common Serjeant sentenced him to 12 months' imprisonment in the second division.

The defendant had been employed in the Ministry of Munitions, and in November last was the head of the section which dealt with the allocation of lead. The allegation was that on November 1 he handed in a requisition from a firm called the Premier Metal Foundry, Limited, for 40 tons of lead to be allocated to them. The lead, which was of the value of £1,291, was supplied, and it was alleged that it was subsequently sold by the defendant. The suggestion of the prosecution was that he obtained it from the Ministry by a trick. He denied the charge.

JUBILEE OF "NATURE."—We extend hearty congratulations to our contemporary *Nature* on the completion of its fiftieth year of publication. The occasion has been marked by the issue of a jubilee number, dated November 6, containing exceedingly interesting reviews by eminent scientists on the developments made in the various branches of science during the past fifty years.

FRENCH CUSTOMS DUTIES ON CHEMICALS.

THE following statement, reprinted from the *Board of Trade Journal*, gives particulars regarding the proposed new classification of, and rates of duty on, the principal chemical products contained in Article I. of the Bill referred to in last week's issue, recently passed by the French Chamber of Deputies and the Senate, but not yet promulgated as law. The rates of duty at present leviable on the articles covered by the new proposals are shown for purposes of comparison. Goods of United Kingdom origin and manufacture are entitled to the rates of the "Minimum" Tariff. Italicised and other letters attached to the rates of import duty refer to the explanatory notes which are given at the end.

NOTE. *Ad valorem* duties are indicated by the use of the "percent." sign (%). In all other cases the rates are quoted in francs (and centimes) per 100 kilogrammes. Unless otherwise indicated, duty is levied on gross weight, when the rate of duty is 10 fr. or less per 100 kilogs., and on net weight when the rate exceeds that figure.

(To be continued.)

DYESTUFFS FROM GERMANY.

DISTRIBUTION OF FIRST CONSIGNMENT.

THE Board of Trade desire to notify consumers of dyestuffs that the first instalment of colours which are being obtained from Germany under the Reparation Clauses in the Peace Treaty will shortly be received, and will be followed at intervals by further quantities.

It is proposed that distribution should be effected as soon as possible after the arrival of each consignment. For the purpose of making this distribution, the information already supplied by the Colour Users' Association and the National Federation of Paint, Colour, and Varnish Manufacturers as to the probable requirements of their members for dyestuffs during the next six months will be utilised as a basis.

In order that this information may be extended so as to cover the whole of the requirements of the colour-using industry of the United Kingdom, it is desirable that any actual consumer of colour who is not a member of the Colour Users' Association or the National Federation of Paint, Colour, and Varnish Manufacturers, and consequently has not submitted any return to either of those bodies, should immediately forward to the Board of Trade, Industries and Manufactures Department, Great George-street, S.W. 1, information on the following points:—(a) The quantity of each particular brand of dyestuff estimated to be required during the next six months, and which is not likely to be available in sufficient quantity from either British, allied, or neutral sources of supply; (b) the approximate consumption during the year 1913 of each of these colours.

As it is probable that the quantities which will become available under these arrangements will not be adequate to meet the whole of the requirements of consumers, the Trade and Licensing Sub-Committee will be prepared to consider applications from actual consumers for additional quantities not coming under the Reparation arrangements, it being understood that any permission granted for the import of such additional quantities will be on condition that any arrangements for the purchase and import will be made by the Central Importing Agency.

INSTITUTE OF CHEMISTRY.

AT a recent special meeting of the council of the Institute of Chemistry in London the following matters came under consideration:—

Patents and Designs Bill.—The Conjoint Board of Scientific Societies have transmitted a report of the Patent Laws Committee, of which Mr. Horatio Ballantyne, F.I.C. (the representative of the Institute in this matter) was a member. The report will be sent to the Board of Trade. Mr. Ballantyne advised that the Institute should approve the report as it stands, as it is mainly on the lines already approved in connection with the proposals of the conference of technical societies. The points raised by the conference have been met to a considerable extent in the new Bill, although there is room for improvement. This course was approved of.

Training Ex-Service Men.—A letter has been received from the Rt. Hon. Sir Robert S. Horne, Minister of Labour, asking the council to assist in the national scheme for placing ex-Service men in training vacancies (without premiums).

Appointments Register.—The Registrar was directed to inform a member who had made the suggestion that the

Institute should recommend individual candidates for vacancies notified in the appointments register, that the council did not see their way to approve this proposal.

Representation on Industrial Councils.—The committee have considered the report of the Registrar on his interview with the officials of the Ministry and have authorised him to approach the employers on a number of industrial councils in order to bring the views of the Institute to their notice, and ascertain whether they would agree to the representation of the Institute on their respective councils.

Chemical Reagents.—A report of the Joint Committee of the Institute and the Society of Public Analysts, relating to the list of reagents, came in for discussion. The committee directed the Registrar to ascertain from manufacturers of fine chemicals whether they intend to manufacture "A.R." chemicals, in order that the committee may decide as to the advisability of amending and extending the existing list, produced in 1915.

Chemists in Naval and Military Services.—A Joint Committee of the Institute of Chemistry and the Institute of Metals considered the position of chemists and metallurgists in the naval, military, and air services, and the action which should be taken to secure for them better recognition and status. After discussion the Registrar was instructed to ascertain from the various specialised departments of the Army, Navy, and Air Force the present position with regard to pay and status of chemists who are employed technically in the respective forces. The committee have before them a number of letters from members in the Special Brigade, R.E., R.A.M.C., etc. They are of opinion that the inadequate recognition of chemists and metallurgists in the services is mainly due to the prevailing ignorance in official quarters of the technical nature of their work and the scope and character of the training required for it.

SOCIETY OF PUBLIC ANALYSTS.

AT an ordinary meeting of the Society of Public Analysts, held at the Chemical Society's rooms, Burlington House, on November 5, Dr. Samuel Rideal, president, in the chair, the following papers were read:—

"THE ANALYSIS OF BRAZILIAN ZIRCONIUM ORE,"

By A. R. POWELL AND W. R. SCHOELLER, Ph.D.

A detailed description of the analysis of the most important ore of zirconium was given. The finely ground material is fused with sodium carbonate, the melt extracted with water, and the insoluble portion fused with bisulphate. This treatment eliminates silica and renders all the other constituents soluble. The solution is precipitated with sodium thiosulphate, and the ignited precipitate weighed as $ZrO_2 + TiO_2 + Al_2O_3$. Titania and alumina are determined in this precipitate, zirconia being obtained by difference. Iron, manganese, lime, and magnesia are determined in the filtrate from the thiosulphate precipitate.

"THE HALOGEN ABSORPTION OF TURPENTINE,"

By ETHEL M. TAYLOR.

In contradistinction to Wijs' solution a solution of IBr_3 in chloroform was found to give a distinct resting stage at a halogen absorption equal to $4Br$ for $C_{10}H_{16}$. This stage was reached practically instantaneously by treating turpentine with a large excess of IBr_3 , and titrating back at once. The secondary reactions leading to further absorption was sufficiently slow not to interfere with the much more rapid main reaction.

REPORTS OF COMPANIES.

Nitrogen Products and Carbide Company, Ltd.

The fifth annual general meeting was held on Tuesday in London, Major C. H. Campbell presiding.

The Chairman said that the profit for the period of eighteen months under review was £118,814., out of which a dividend of 9 per cent. had been paid, £10,000. transferred to reserve for contingencies—now nearly £110,000.—and £14,396. carried forward. In respect of the undertaking at Vilvorde, which town was occupied by the Germans early in the war, a claim had been lodged with the Foreign Claims Office, and it might be hoped that in the near future this claim would be liquidated, with others due to the affiliated Nitrogen Fertilisers, Limited, the total exceeding £270,000. The right to use in France the company's catalytic process for the production of nitric acid had brought in over £55,000. of royalties, and, notwithstanding the cessation of hostilities, the licence still had value, as it provided for payment of royalties on a minimum tonnage within the next seven years. A considerable loss was incurred in operating the Dagenham works, which were employed on the production, by the catalytic process, of ammonium nitrate for the British Government. The plant was specially designed to produce ammonia from cyanamide manufactured at the company's works in Norway. Owing to submarines, it became impossible to obtain adequate supplies, and the only alternative was to use the ammoniacal liquor from gasworks. The Government authorities were very unsympathetic. Every effort was made to obtain ammoniacal liquor, but without great success. After considerable difficulty the Government placed controlled supplies of ammoniacal liquor at their disposal, but at a price much greater than that of the equivalent ammonia in cyanamide, upon which the contract had been based. Moreover, the use of ammoniacal liquor entailed endless difficulties in treatment, and extra expense. With the restrictions on the purchase of plant, this state of affairs could not be speedily remedied, and they had to make the best of temporary expedients until appropriate appliances were available. The company's process was adopted by the French Government after close investigation of all known systems of fixation of atmospheric nitrogen. The French Government undertook to build a factory, and in September, 1916, the first units were in successful operation, but before this date the Government had voted about £15,000,000. for the establishment of cyanamide, nitric acid, and nitrate works in France, paying the company a royalty on all acid manufactured. Extremely valuable experience had been obtained in the operation of the process on a large scale, leading to numerous improvements. Through Nitrogen Fertilisers, Limited, the company owned the bulk of the shares in Alby Carbidefabriks, Sweden. In the period under review an offer was received and accepted for this interest, and Nitrogen Fertilisers realised a profit of over £345,000. on the investment, and were enabled to pay off the first and second debentures on the cyanamide factory, entirely freeing it from encumbrance. Water power was assuming greater importance, and in this respect they were in a very fortunate position. The Alby Company's works at Odda, Norway, were supplied with about 65,000H.P. The Aura water power had a total capacity of about 250,000H.P., and Dettifoss in Iceland had a capacity of at least 400,000H.P., as yet unharnessed. The total was 700,000H.P., and to generate the same power from coal would require fully 4,500,000 tons per annum. The intention was to concentrate their energies on the development in Norway of processes requiring no coal, or so to perfect the process as to reduce the coal requirements to a minimum. It was intended also to utilise their water power for the production of a fertiliser. Research had shown the possibility with cheap power of producing nitrate of soda without any imported raw material, and this process, if developed successfully, should have a very great future. In recent years considerable progress had been made in the electrical smelting of iron ore, using a much less proportion of coal than in blast furnace practice with coke. Norway contained large deposits of iron ore which had been successfully treated by electrical methods. Other fields under investigation were the manufacture of cyanides used in the extraction of precious metals, and sodium cyanide, the most valuable of all.

The report and accounts were unanimously adopted, and, the usual formal business having been transacted, an extraordinary general meeting was held, at which sanction was given to the proposed amalgamation with Alby United Carbide

Factories (Limited), and the voluntary liquidation of Nitrogen Products and Carbide Company (Limited).

Alby United Carbide Factories, Ltd.

The twelfth annual general meeting was held on Tuesday in London, Major C. H. Campbell presiding.

The Chairman said that the profit for the eighteen months ended on December 31, 1918, was £25,595., after providing £34,246. for depreciation, and with the amount brought forward there was £39,727. available. Dividends of 5½ per cent. on the preference shares, and 6 per cent. on the ordinary shares, left £6,837. to be carried forward. This was probably the only company in this country which was exclusively engaged upon war work and yet made direct loss, which had been incurred through their having, for a considerable time, to pay enormous rates of freight to ship owners to carry their coal to Norway, without receiving any recompense for these huge expenses. When the Government did help them to bear a part of the freight, they would only pay the Company a price for its carbide very much below the price at which the Government sold to consumers, a proceeding which was entirely unjustified. There was no reason why manufacturers should make loss on supplying material to the Government, while the Government were making large profits on re-selling it to firms engaged in munition work. At the end of 1917 they received from Norwegian financiers an offer to purchase the Norwegian assets for several millions sterling, but the Government asked them on patriotic grounds, not to dispose of the works, and the proposed sale was abandoned. Instead, however, of receiving better treatment from the Government, they were forced to accept contracts showing little or no profit. Then, when the war was over, the Board of Trade took a different view of the Company's nationality from that of the Foreign Office. It was as a British company that they were controlled by the latter, but the Coal Mines Department of the Board of Trade compelled them to pay for coal at the same prices as neutrals, so that their coal cost them more than double the price paid by other British buyers, and more than was paid by French, Italian, and other Allied competitors. As a matter of fact, the Company was entirely British. Had it not been for their unjust and unreasonable treatment by the Government, the Company's present position would have been very different. Excellent progress had been made at the electrode works at Hebburn-on-Tyne. At the end of the war there was a temporarily decreased demand for their electrodes. The opportunity was utilised in experimental work with extremely satisfactory results, the quality of the electrodes being enormously improved. The effect should be of great importance to their works in Norway, where they consumed several thousands of tons of electrodes per annum, and there was no doubt of the considerable amount of business for deliveries of electrodes to other electro-chemical factories. From every point of view they were to be congratulated on the erection of the Hebburn works. The development of some of the company's processes had been somewhat retarded by war, but steps were now being taken to demonstrate their practical value. War had brought acetylene into its own, and its use for lighting, and in a compressed form for commercial and industrial purposes, had resulted in many important developments. They could, therefore, confidently look forward to an ever-increasing field of usefulness for compressed acetylene. The directors had looked forward with anxiety to a very lean time immediately after the close of hostilities, and too much must not be expected from the current year's trading. Fortunately, however, they could now look forward with much greater confidence to the future. They had reason to hope that the worst was past.

The report and accounts were unanimously adopted, and the usual formal business having been transacted, an extraordinary general meeting was held, when approval was given to a proposition to effect amalgamation with Nitrogen Products and Carbide Company (Limited), and to increase the capital of Alby United Carbide Factories (Limited) to £2,332,916., by the creation of 1,607,916 new ordinary shares of £1. each. The articles of association were altered so as *inter alia* to make possible the capitalisation of undivided profit, with a view to the capitalisation of £80,261., part of the reserve fund, for distribution among the ordinary shareholders.

St. Austell China Clay Company, Ltd.

The accounts for the year ended, September 30 show a loss of £335., increasing the debit balance brought forward to £5,145.

Langdale's Chemical Manure Company.

Mr. W. B. Van Haansbergen, took the chair at the annual meeting at Newcastle, and, in moving the adoption of the report, said, regarding renewals and repairs, that some had been carried out, but owing to the increased cost of labour and materials, certain needful replacements had had to be postponed. With reference to Labour Unions and Combines, the chairman said that while he did not at all object to the right to strike, he deprecated the coercion attempted when a strike was threatened unless something was granted instantaneously. The right to strike without notice was indefensible. The chief cause of difficulty in the labour world had been irresponsible agitators, who, while in a ridiculous minority, were allowed to dominate their more responsible and more industrious companions. The real labour man, was one for whom he had great admiration; he had always been able to get on with him, and quite expected that sooner or later he would realise the anomaly of the position in which a small minority or any minority should be able to persuade the majority of real workers to follow advice obviously a contradiction of fair dealing, such as striking without notice. In reviewing the accounts, the Chairman said the liabilities were £14,967, this year against £18,026, last year. This was merely caused by the fluctuation in the arrival of raw material. The gross profit for last year was nearly £6,000, greater than this year, but the real figure to consider was the net profit. The difference in the net profit was about £1,800, but that would not make any essential difference to the shareholders. The report was adopted. A dividend of 5 per cent., free of income tax was declared for the present year, and a final dividend of 2s. per share free of tax for the year 1918.

Electro Bleach and By-products, Ltd.

The directors have called a meeting for November 14 to consider an increase of the nominal capital from £180,000. (120,000 preference shares of £1. and 120,000 ordinary of 10s.) to £480,000., to be divided into 320,000 preference shares of £1. and 320,000 ordinary of 10s. It is proposed to issue 80,000 preference shares and 80,000 ordinary shares. The proceeds will be applied to the following purposes: (1) The Government advanced £116,218. for extensions at Middlewich, and under the agreement £35,890. remains to be repaid, when the plant, etc., will become the property of the company. The new plant is now available for the ordinary trade of the company. (2) The company have purchased the whole of the Government plant, etc., on the company's works at Middlewich for £10,000. (3) The company propose to redeem the whole of the outstanding debentures—namely, £50,500. (4) The balance will be available for extensions and development. There will remain in reserve 120,000 preference shares and 120,000 ordinary shares. The money required to pay dividends of 7 per cent. on the 80,000 new preference shares and 12½ per cent. on the 80,000 new ordinary shares is £10,600. The repayment of the debentures will save £6,000. per annum, and the repayment of the loan from the Ministry of Munitions will save approximately £2,150. per annum, leaving only £2,450. to be found out of profits. A report from the auditors justifies the directors in saying that the profits during the first half of the current year are very satisfactory.

Minerals Separation, Ltd.

At an extraordinary general meeting in London on Monday, under the chairmanship of Mr. Francis L. Gibbs, the following resolutions were adopted:—(1) That this meeting hereby sanctions the increase by the directors of the share capital to £500,000., by the creation of 450,000 new shares of £1. each, ranking *pari passu* in all respects with the existing shares. (2) That 50,000 of the said new shares be offered to the registered members of the company, pursuant to Clause 42 of Table "A" in the First Schedule to the Companies (Consolidation) Act, 1908, as amended by Clause 18 of the articles of association of the company, at a premium of £1. per share.

British Oil and Cake Mills Company, Ltd.

The trading profits for 1918 were £369,088., after providing for excess profits duty, and £15,640. was brought forward. Dividends amounting to 15 per cent. have been paid on the ordinary shares, and it is proposed to add £49,441. to the reserve, £50,000. to the depreciation fund, and £5,000. to the pension fund, and to carry forward the remaining £17,570. An interim dividend of 10 per cent. has been paid on the

ordinary shares for the current year. The board, in order to carry to completion the various enterprises in which they are engaged, to provide for further extensions which are contemplated, and to finance an expanding trade at enhanced values, have decided that the capital must be increased. They recommend that it be raised from £2,000,000. to £10,000,000., by the creation of 8,000,000 shares of £1. each. Their present intention is to duplicate the ordinary share capital of £1,250,000 by offering to the shareholders at par one new share for every ordinary share now held. Mr. C. R. Beckitt, Mr. J. Mouat, and Mr. J. B. Willows (directors), offer themselves for re-election.

Amelia Nitrate Company, Ltd.

The report for the year to June 30 last states that the gross trading profits amount to £17,561., and income on investments to £1,019., making, with £445. brought in, £19,025. Deducting administration expenses, interest, contribution to propaganda, and provision for income-tax, there is available £6,508. After payment of the preference dividend the directors propose a dividend on the ordinary shares of 2 per cent., carrying forward £388. The great falling off in the profits is due to the fact that with the signing of the Armistice the Government orders for nitrate ceased suddenly, and producers were from November till May prevented from finding a market for the large stocks they then had on hand, so that the present accounts treat less than half the usual quantity of nitrate. In view of these adverse market conditions the company's two maquinas were closed down early in 1919, but the extraction and stacking of large stocks of raw material were continued. This period of inaction was also utilised in effecting considerable repairs to the maquinas, which had long been urgently needed, and both oficinas have now re-started work in a state of thorough efficiency. The balance of proceeds of the sale of oficina "Cecilia" was received during the year under review.

Santa Catalina Nitrate Company, Ltd.

The reports for the year to June 30 last states that the gross profit for the year is £23,306. Deducting London expenses, £2,239., income-tax, £1,391. and depreciation of investments, £690., and adding £2,741. brought in, the total is £21,727. An interim dividend of 5 per cent. was paid in June last, and the directors propose a final dividend of 15 per cent., making 20 per cent. for the year, write off £1,675. for depreciation of grounds and £1,675. for depreciation of plant and machinery, carrying forward £2,577. Profit has been taken on 134,895 quintals of nitrate sold and delivered, the quantity manufactured during the year being 371,000 quintals. Manufacture of nitrate has been suspended since July last.

Broken Hill Proprietary (Block 10) Company, Ltd.

Cabled advice having reference to the reports and accounts for the half-year to September 30 last has been received from the head office in Melbourne to the following effect: "Owing to the workmen going on strike, work ceased on May 5. Operations for the half-year have resulted in a net profit of £22,677, including a large surplus received for production of previous period. After providing £17,550. for depreciation on shares in other companies, the balance to the credit of profit and loss account is £85,762. Liquid assets in excess of liabilities, £91,127. This does not include the shares in other companies."

DIVIDENDS.

FULLER'S EARTH UNION COMPANY, LTD.—Interim dividend at the rate of 8 per cent. per annum on the ordinary shares for the past half-year.

SAN LORENZO NITRATE COMPANY, LTD.—No interim dividend will be paid.

GREEK PROHIBITION OF SULPHUR AND SULPHATE OF COPPER IMPORTS.—The Greek Government have decided to prohibit the importation into Greece until October 3, 1920, of sulphur and copper sulphate. This decision has been taken on account of the stocks existing in Greece largely exceeding the needs of the country.

CORRESPONDENCE.

***We do not hold ourselves responsible for the opinions expressed by our correspondents.*

IMPORTATION OF GERMAN DYES.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Referring to the article in last week's journal, taken from the *Morning Post*, may I be permitted to make a few remarks as an old representative of a German colour firm?

The assertion is made, the writer says, that the agitation in the wool trade for the importation of German colours is due to pre-war German agents for German dyes. I am acquainted with most of the important pre-war agents and representatives of German houses, and I can safely say that this agitation is none of their causing, even though "they are in danger of losing much business through the import restrictions." Quite a large proportion of old representatives of the German houses are now employed by British colour firms. The agitation in the woollen industry has been audibly voiced, but there is great unrest and annoyance in nearly every colour-consuming industry on account of the restrictions. This is not due to a want of patriotism. Most men would like to see a domestic colour manufacturing industry in this country, and would undoubtedly give it all assistance possible, but most Englishmen are reluctant to be forced to give it assistance willy-nilly. What is wanted by the majority of colour consumers, so far as I can judge, is at least the possibility of obtaining more plentiful supplies of dyes from any source, be it British, Swiss, American, German, or even Japanese, and also the possibility of obtaining those dyes never yet made outside Germany. It is surely a very narrow point of view to defend the restrictions by saying our manufacturers are as well placed as any similar class of manufacturers in other parts of the world. That may be the case, but dye consumers now kick against what one might term dodging, and desire to resume at the earliest moment their pre-war normality, to be able to guarantee their goods as formerly, and to lead the way rather than to be only equal to others.

There is tremendous shipping business waiting for this country the moment the various dye consumers can obtain certain colours of pre-war use. Unfortunately, there is not plant enough anywhere outside Germany to cope with this pending business, and we overlook the fact that every penny spent on German colour will bring back so much more from the subsequent shipment of coloured cloth, etc. Are we to thus strangle our exports—the life blood of the nation at the moment—in order to badly protect the colour industry of this country? Could the protection not be given in some other and more effective manner, and in a more equitable way, than the Board of Trade's present scheme?

Why not give the pre-war agents for German colour firms and their old representatives a little consideration? Why not allow the importation of German colour to come through them? Protect the British industry by only allowing colours to be brought in which are not made here, or are not made here in sufficient quantities to give consumers all they want; make a stipulation that no importing firm shall employ German assistance for a term of years; let the Licensing Subcommittee be made more representative, and let it decide as to whether a colour is made here and as to its sufficiency; go further if you like—as the British manufacturer turns out a colour in still greater quantity, sufficient to meet all demands here,—and place an embargo on the identical foreign colour. To adopt such a scheme of protection would be effective and fair, and would give the small section of the community—the pre-war agents and representatives—the chance of coming in for a little of their own, which, with present restrictions, I say candidly they are being robbed of.

These restrictions are imposed, the writer in the *Morning Post* goes on to say, to protect the consumer, and not exclusively for the benefit of the industry. Has it struck people here that whilst we are making good—i.e., to the present German standard,—the Germans, with their greater experience and their remarkable organisation, will be forging ahead of us, and giving people in other and broader-minded countries the benefits of their new inventions to our very serious detriment. The question is indeed very complicated, and we must avoid taking too narrow a view of the matter. In the *Morning Post* reference is also made to what the German monopoly meant in the past and the manner in which it was wielded, and a German authority is quoted as

saying that the Reparation Commission, by its agreement with the German Government, prevents them in the future from selective selling. My experience, and that of a colleague who was with one of the largest German firms, prompts me to say at once that the Germans never sold selectively, as suggested. Such a selective selling policy of, "if you want this you must also take that," was a fact whilst the war was on in our own market.

Sir, the agitation amongst the woollen dyers and others for the importation of German colours is perfectly justified. The shortage is appalling, and every man in the colour-consuming trades knows of it. Where is alizarine red at present; what about Victoria blue, which has risen in price a matter of nearly 10s. per lb. in the last two or three weeks? What about rhodamines, of which there is none about, and dyers and printers are calling in vain for them—starving, as it were? And what about prices paid to-day for colours? Is it right that the present monopolies should be maintained when we have the power to bring in a little healthy competition? What is to be said about the 100 per cent. bonuses of the foreign firms selling here to-day? Are colour consumers to continue paying through the nose for their very essentials? Time after time it has been said how much we are indebted to the Swiss firms for their assistance during the war. No one wants to decry their use to us, but may I dare to suggest they have been very amply remunerated for it?

Surely the Board of Trade has recognised the unrest there is, and it is up to them to alter matters and to be fair to all. It appears as though we are looking no further than the end of our nasal organs.—Yours, etc.,

"FAIRNESS."

Manchester, November 10, 1919.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

Nothing has yet occurred to justify an increase of production in the coking and by-product industries of Cumberland, but it seems quite likely that the plants may be able to resume full operations without waiting for a boom in the iron trade. It has been generally assumed that there was not much prospect of any other outlet except the local outlet being found for the softer coke which the district produces. That assumption, however, it is hoped, is to be falsified. Inquiries are coming in from the Continent for Cumberland coke, and there is an exceedingly good chance of a contract being fixed up for a supply of coke spread over three months which would maintain the ovens in full operation for that period. The position certainly is very precarious at present. With the iron moulders' strike still continuing it is more than doubtful whether the output of ordinary iron can be much longer required. There are not more than twelve furnaces in draught on ordinary iron between Workington and Carnforth, and these of course do not absorb even half of the make of the 380 ovens in full blast. The majority of the ovens are indeed working at between a third and a half of their capacity, and small though that production is some of the yards have to be jammed with stocks. East Coast coke supplies are also smaller. To West Cumberland this week they are 4,000 tons, and to the Furness district, 13,000 tons. Benzole and sulphate of ammonia are by-products that are in brisk demand, and a good deal of the pitch is being exported. The chemical works are busier. Sulphuric acid is an improving market.

ELATERITE.—Elaterite is the common name for wurtzilite. This is one of the hard varieties of native asphalt, and is closely similar to gilsonite and grahamite. Practically all the elaterite produced in the United States comes from Uinta County, Utah, says the United States Bureau of Mines Report. Refined elaterite is used principally in the manufacture of marine and iron paints, acid-resisting compounds, and other protective coatings, and in the manufacture of rubber. The demand, though small, appear to be steadily increasing as a consequence, it is believed, of the successful employment of this mineral as a primary constituent of prepared flooring. Development of the elaterite deposits in Utah has been retarded by the restricted market for the material, and by the location of the deposits remote from railway transportation. Petroleum refineries, equipped for the manufacture of asphalt, are located in practically all parts of the United States. In 1917 elaterite at the mines sold for an average of 88.69 dollars per cent. per ton, and gilsonite sold for an works are busier. Sulphuric acid is an improving market.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month ending Oct. 31st, 1919, as compared with Oct. 1918.

(To be concluded.)

PARLIAMENTARY NEWS.

Steel-testing Laboratory.

In the House of Commons, Mr. Neal asked the Parliamentary Secretary to the Ministry of Munitions whether premises have recently been taken in Sheffield for use as a steel-testing laboratory at an annual rental of £500.; whether it is intended that this laboratory shall be permanent or temporary, and, if the latter, for how long it is intended to use the same; and what is the need for this department and what is the estimated annual cost thereof?

Mr. Kellaway: The premises at Townhead Street, Sheffield, were taken over in December, 1917, at an annual rental of £500. for use as a metallurgical laboratory. During the past year all other temporary metallurgical laboratories, established during the war in various parts of the country, have been closed down. A laboratory, for the testing of steel and other metals for artillery equipment and aircraft, will be required so long as stores of this nature are supplied to the War Office, the Air Ministry, and other Departments. The future annual cost is estimated at £6,100., and it is expected that an approximately equivalent sum will be recovered from contractors.

Transport of China Clay.

The Parliamentary Secretary to the Minister of Transport (Sir Rhys Williams), on Monday, in reply to Sir E. Nicholl, said: I am aware that the china clay district near St. Austell is, together with many other districts, suffering from the shortage of railway wagons, and the possibility of improving the situation is engaging the attention of the Ministry of Transport.

Derbyshire Oil.

The Deputy-Minister of Munitions (Mr. Kellaway), replying to Sir Arthur Fell, said: Progress in the Derbyshire boring operations has recently been somewhat delayed by unavoidable accidents and difficulties in getting material. The boring at Hardstoft is still flowing at the rate of about 260 gals. a day, and the oil is being put into storage on the spot. There are about 36,500 gals. in stock. No further tests as to the quality of the oil have been made, but there is no reason to suppose that there has recently been any appreciable change in its character.

Quality of British Dyes.

Major McKenzie Wood asked, on Monday, the President of the Board of Trade whether he was aware that the subsidised dye manufacturers were supplying to woollen manufacturers dyes which were not fast to milling, and that in consequence quantities of good material were being spoiled weekly; and whether he would take steps to enable woollen manufacturers to obtain dyes that could be guaranteed?

Sir A. Geddes: I have received a complaint to the effect described from one firm, but I have at present no reason to suppose that it is representative. If dye-users cannot obtain dyestuffs of suitable kind or quality from domestic sources it is open to them to apply for licence to import.

Mr. Hogge: The right hon. gentleman has received one complaint. Can he say whether he has investigated it?

Sir A. Geddes: In all these cases investigation is at once undertaken. I am not in a position to say whether the complaint is accurate or not. There is always inquiry made.

Price of Soap.

Major Barnes, on Tuesday, asked the President of the Board of Trade whether, in view of the great increase in the price of soap since the Armistice, and the fact that recent purchases of soap manufacturing companies had brought the manufacture of soap in this country almost entirely under one control, that of Messrs. Lever, Ltd., he would appoint a committee to inquire into the exercise of that control and report as to the desirability of the State taking any action towards the regulation of the price of this essential commodity?

Mr. Bridgeman said a sub-committee of the Central Committee had already been established under the Profiteering Act, and was at present engaged in investigating and inquiring into the manufacture of soap.

Costings Branch of the Ministry of Munitions.

Mr. R. Young asked the Prime Minister whether the successful work of the technical costings branch of the Ministry of Munitions has been brought to his notice; and

whether, in view of the fact that £300,000,000. was saved to the nation in Government contracts during the war at the small cost of £75,000., he will take steps to continue and extend the work of the said committee in relation to all future Government contracts, and thus assist in furthering the work of national economy in all Government Departments?

Mr. Bonar Law: The Government are considering the best way of making use in future Government purchases of the experience gained during the war.

NEW COMPANIES.

Anglo-American Sulphur Company, Ltd.—Capital £150,000., £1. shares (75,000 preference). Registered office: 54, New Broad Street, E.C.

Grenville United Mines, Ltd.—Capital £100,000., 5s. shares. Object: To carry on in Cornwall or elsewhere the business of miners, and preparers for market of tin, wolfram, arsenic, copper, ores and minerals, etc. Registered office: Granville House, Arundel Street, W.C. 2.

Scottish American Oil and Transport Company, Ltd.—Capital £5,000,000., £1. shares. Solicitors: Grundy, Kershaw, Samson and Co., 6, Austin Friars, E.C.

Wailes Dove Bitumastic, Ltd.—Capital £200,000., £1. shares. Object: To take over the business carried on by a company of the same name at Newcastle-on-Tyne, and elsewhere, and to manufacture, deal in, and apply enamels, solutions, tank top coverings, cements, paints and compositions for the protection of steel, iron, wood, and stone work; manufacturers of and dealers in sheathings, coatings, oils, grease, paints, and tar, oil boilers, soap manufacturers, etc. Registered office: 5, St. Nicholas Buildings, Newcastle-on-Tyne.

Welsh Mines Corporation, Ltd.—Capital £50,000., in 44,000 shares of £1 each and 120,000 shares of 1s. each. Object: To enter into an agreement with Lisburne Development Syndicate, Ltd., for the acquisition of certain blende and lead mines and dumps on the estate of the Earl of Lisburne, near Aberystwyth. Office: 80, Bishopsgate, E.C.

British Renovating Company, Ltd.—Private company. Registered October 28. Capital £1,000., £1. shares. Builders, paint manufacturers, boiler coverers, etc. Registered office: 73, Burnham Street, Canning Town, E. 11.

Central Iron and Metal Company, Ltd.—Private company. Capital £5,000., £25. shares. Registered office: 9, Draper's Gardens, E.C.

Charles F. Morriss and Co., Ltd.—Private company. Capital £5,000., £1. shares. Refiners and manufacturers of and dealers in oils, tallow, and grease, etc. Registered office: 143, Lime Street, Hull.

Coal Treatment Processes, Ltd.—Private company. Capital £47,500., in 45,000 preferred ordinary shares of £1. each and 50,000 deferred shares of 1s. each. Object: To acquire processes for the economical treatment of coal, oil, shale, wood, peat, lignite, and other material, etc. Registered office: 638, Salisbury House, E.C. 2.

Darring, Croft, Brown, Ltd.—Private company. Capital £3,000., £1. shares. Object: To acquire the property and rights of D. E. Brown in certain secret processes and formulæ for the manufacture of detergents, toilet and household soaps, etc. Registered office: 36-7, Queen Street, E.C.

Electrofer, Ltd.—Private company. Capital £10,000., £1. shares. Object: To acquire and exploit patents and/or processes for the electrolytic deposition of various metals, etc. Registered office: Maxwell House, Arundel Street, W.C. 2.

Elias Palme Steinchonau (Bohemia) Glass Works, Ltd.—Private company. Capital £100., £1. shares. Registered office: 195, Wardour Street, W.

International Laboratories, Ltd.—Private company. Capital £10,000., £1. shares. Solicitors: Jackson, Elwell and Curran, 65, Coleman Street, E.C.

Oil Nut Trading Company, Ltd.—Private company. Capital £30,000., £1. shares. Registered office: 1, Gresham Buildings, Basinghall Street, E.C.

Power Alcohol, Ltd.—Private company. Capital £3,300., in 3,000 shares of £1. each and 6,000 shares of 1s. each. Object: To acquire the patents granted to C. J. Le Petit for improvements in the manufacture of a motor spirit known as "Alfatyl," and apparatus and machinery therefor, including patents for N.Z., Australia, India, Rhodesia, Union of South Africa, U.S.A., and France. Registered office: 3, Crown Court, Old Broad Street, E.C.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—Last month's shipments from Chili were, as expected, on a much larger scale than for some time past, reaching 168,000 tons, of which 106,000 tons to Europe (including Egypt) and 62,000 tons to the United States and other parts. The quantity of 1,600,000 tons named in our last issue is not "shipped" (as implied by the introduction through a printer's error of the word "went"), but reported "sold" for delivery up to the end of March next; this means an average of nearly 300,000 tons per month from now onwards—a very large order even if tonnage were plentiful instead of scarce as at present. Freight which before the war were about 20s. are now nominally about £11. per ton for steamers and £9. for sailing vessels. The October output in Chili shows a trifling increase at 114,000 tons, but the stocks there, for the first time this year, have been slightly reduced, the total being about 1,650,000 tons, compared, however, with 673,000 tons on November 1, 1913, the corresponding *ante-bellum* date! While they will rapidly be diminished by exports, they will, on the other hand, be added to by the output of numerous oficinas about to resume operations; so there is no prospective dearth of the Chilean fertiliser, the demand for which, in the consuming countries, is still an unknown quantity. That on the West Coast appears to have been satisfied by the large forward sales, no further business being reported by the Producers' Association, but the German companies have sold nitrate for delivery next year at sixpence per quintal under the official price. European merchants having presumably filled their requirements for next spring, the outcry against "fixed prices" in Chili has ceased, but the country dealers, the backbone of the trade, take little interest in nitrate of soda at the present level, and the market is quite nominal.

Sulphate of Ammonia Scarce in Italy.—The Italian market for nitrate of soda is reported as unchanged. Sulphate of ammonia is very high in price, and is quoted round about 140 lire per quintal. There is a continued shortage of foreign goods, and the deficiency in national production is also very marked.

Reconstituting the German Potash Syndicate.—The Germans, with an eye, of course, to the future, are investigating the position of their Potash Syndicate. This syndicate is now reconstituting with a tentative capital of 1,500,000 marks, which, it is observed, is only a starting point.

French Phosphate Securities Confirm Good Business.—The prospects of the fertiliser companies, particularly in the matter of raw material most interesting to the French, are obviously good from the high prices ruling on the French market for shares. The Tunisian Phosphate shares are quoted very firm, but the company has not succeeded in ensuring a vote for increasing its capital, as intended, owing to the necessary forum being lacking at the meeting called for the purpose. The Omnium d'Algerie-Tunisie is held very firm, particularly in view of the impending increase of capital of the Constantine Phosphates concern. The Gafsa concern is also quoted firm, and is considered to be doing well.

Sulphate of Ammonia.—There appears to be something of an improved sale of this material, probably occasioned by the fact that the controlled prices will be dearer later on. There is still nothing, or hardly anything, available for export, and not likely to be before the end of this year. Quotations for export are therefore nominal, and the value is given at anything from £25. to £30. per ton, net cash, f.o.b. British ports, in double bags. Advices from New York state that there is on that side of the Atlantic a decided scarcity of supplies throughout the market. This has been the condition recently, but the situation seems to be gradually becoming more serious. Large unfulfilled orders are reported in many directions, with only occasional quantities of a few hundred tons appearing in the market. Prices are maintained at a high level.

Basic Slag and Superphosphate.—A much bigger business could be done in basic slag were it not for the endless delays at works. This is quite an old story now. The high favour extended both to slag and superphosphate is now well known, and the materials are being asked for more and more. At the same time, there appears to be something like a world's phosphate shortage, and this is not being helped by the

critical position of affairs in the American phosphate districts. First, curtailed production ensued, and shipments almost ceased owing to a strike in Florida; then, when production became better, the wagon situation got bad, and the rock could not be transferred. In America about two-thirds of the acid phosphate plants are now shut down for want of rock, whilst others are operating at a fraction of their capacity. It is said that there are large quantities of rock, however, in Florida mining district ready for shipment if only it could be moved, and the American fertiliser men are hammering away at the Washington Department of Agriculture to secure betterment.

Potash.—Potassic fertilisers appear to be getting a little better into supply, but competing purchasers have now opened out. For example, Scandinavia is declared to be buying Alsatian potash freely, some 20,000 tons having already been ordered. The imports of Alsatian potash into the United Kingdom during the week ending November 8 were 259 tons of 20 per cent. sylvinite and 212 tons of 14 per cent. Current quotations are as follows: Sylvinite, 14 per cent. (French kainit), £7. per ton; sylvinite, 20 per cent. (French potash salts), £8 7s. 6d.; and muriate of potash, 80 per cent., £19. 7s. 6d. per ton.

Other Fertilisers.—The bone meal market is on the dull side, and there has been no change in values; nor, apparently, are there likely to be until something happens in the supplies department. Material is certainly wanted very badly in many quarters. In the meantime, pure steamed 1—60 per cent. meal remains at £13. 10s. to £14., and 3—32 per cent. material at £15. to £15. 10s. Meat meal finds a moderate demand, with values nominally at about 30s. per unit of ammonia. There is very little dried blood offering, and values are at about the same price. Tankage offerings are very small, especially from the River Plate, and values are only nominal at about 30s. for ammonia and 2s. 6d. for phosphates.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

Production of tinplates at the various works is now increasing, and the total output is growing satisfactorily in dimensions. The Far Eastern business is becoming a very important factor in this industry, and the demand for plates for Japan is very good. A pleasing feature in this respect is the fact that a Japanese line of steamers have commenced regular sailings from Swansea, and these will considerably help in the clearance of dock stocks of tinplates. A good sized parcel left during the week for Gothenburg, and there are signs that the Norwegian trade will become even greater than before the war.

The output of patent fuel is still on the increase. The demand, especially for foreign markets, grows week by week, so much so that very often there are no offers made by manufacturers. During the last few days record cargoes have left Swansea for foreign destinations, chiefly Tunis, Palermo, Dieppe, St. Nazaire, Naples, Genoa, and Calais. The Cardiff makers have sent shipments to Rouen and Dieppe.

On Wednesday the funeral of Mr. Samuel Williams, J.P., of Pontardulais, took place at Rhydygoch. The deceased gentleman had intimately been acquainted with the chemical industry in South Wales for many years, being one of the founders of the Pontardulais Chemical Works, and was at one time a director of Messrs. Joseph Bevan and Sons' Chemical Works. He was in his 84th year.

The number of coke ovens operating has been increased, and the by-products are being quickly disposed of. There is a ready market for sulphate of ammonia, and benzole, and the demand for pitch is of a strong character. Important cargoes of coke have been despatched from Newport to St. Malo, Treport and Port Sudan, and Cardiff ovens have supplied good quantities for Port Said.

Much satisfaction is expressed at the settlement of the dispute at the Rio Tinto ore mines in Spain. The home copper trade has suffered greatly during the last 12 or 18 months from the scarcity of ore. There arrived in Port Talbot this week 875 tons of copper precipitate, and 250 tons of unwrought copper from Huelva, and 180 tons of copper matte transhipped at Avonmouth.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

November 3rd to 8th (inclusive).

Carbonisation of Coal, Lignite, Shale, etc. Bale, G. F. 27,090.
Insecticide. Bardsley, J. W.; and Bradley, G. W. J. 27,336.
Combustible Gaseous Compositions for Cottons, Weaving, etc.
Brownlee, R. H.; and Uhlinger, R. H. 27,290.
Electro-deposition of Aluminium. Chadaick, S.; and Walker, M. 27,490.
Smelting, etc., Furnaces. Coward, W. H. 27,369.
Asphaltic Cement or Bituminous Composition for Road-making.
Flooring, Roofing, etc. Crosbie, M. T. 27,607.
Extraction of Lead and Zinc from Ores. Elmore, F. E. 27,580.
Purification of Sewage. Hartley, C. J. and J. W. 27,295.
Chrome Alum. Hultman, G. H. 27,016.
Diaz-compounds. Knecht, E. 27,318.
Stirring-devices for Agitating Liquid. Lees, W.; and Meers, W. 27,321.
Removal of Dust from Blast-furnace Gases. Lanning, R. 27,257.
Boiling-pans and Mixing-machines. Macdonald, J. 27,436.
Reducing and Refining Apparatus. Marks, E. C. R. (National Equipment Co.). 27,120.
Extraction and Recovery of Gold from Ores. Martin, W. M. 27,039.
Evaporating Plant. Metropolitan-Vickers Electrical Co.; and Scanes, A. E. L. 27,428.
Softening or Purification of Water. Rushton, B. F. 27,019.
Phthalic Anhydride. Sasa, H. 27,221.
Pulverisers, and Process of Fine Grinding. Sevmour, F. 27,522.
Acetyl Cellulose. Silberrad, O. 26,869.
Artificial Silk. Stulemeyer, C. L. 27,209.
Pigments. Tyrer, D. 27,000.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25 Southampton Buildings, Chancery Lane, W.C.

1918.

Destructive Distillation of Petroleum Pitch. Nemi, K. 2,432. 114,617
Destructive Distillation of Carbonaceous Materials. Peckin, F. M.; and Nitrogen Products and Carbide Co. 2,920. 134,236
Ammonia and Ammonium Compounds. Taylor, G. G.; and Knapp, I. E. 4,455. 134,237
Indicating and/or Recording Quantities of Carbon Monoxide in Hydrogen. Rideal, E. K.; and Taylor, H. S. 9,205. 134,243
Benzyl Chloride and Benzal Chloride and Homologues and Substitution Products. Levinstein, Ltd.; Levinstein, H.; and Bader, W. 12,227. 134,250
Fermentation of Cellulose. Power Gas Corporation; and Langwell, H. 15,942. 134,265
Colouring-matters. Brass, W. R. 16,939. 134,270
Ammonium Perchlorate. Aarensen, D. 17,700. 121,727
Formation of Precipitates for Example Pigments. Kidd, F. G.; and Wilkinson, Heywood, and Clark. 17,726. 134,313
Tin-soldering and Tin-coating Aluminium or Aluminium Alloys. Bloxam, A. G. (Stabilimenti Biani-Ing. A. Pouchain). 17,739. 134,315
Rectification of Hydrocarbons. De Bataafsche Petroleum Maatschappij; and Brey, J. H. C. de. 17,741. 123,522
Artificial Fuel. Bowen, R. 18,432. 134,355
Retorts and Stills. Prentice, J. 20,447. 134,406
Treatment of Effluent from Piece or Like Scouring Processes. Distillates, Ltd.; and Jarmain, G. G. 20,859. 134,410

1919

Mixing Liquid, Semi-liquid, or Viscid Materials. Sonsthagen, A. 3,117. 134,451
Centrifugal Apparatus. Loring, F. H. 10,891. 134,487
Pyrometer. Malone, J. F. J. 13,357. 134,498
Oil Extraction. Soc. Anon. Usines de Kerkelare. 14,901. 128,222

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1919.

Indicating at a Distance the Level of a Liquid Contained in a Tank. Ratti, G. 19,508. 134,520
Alcohol. Elektrizitätswerk Lonza. 19,573. 134,521
Oxidising Anthracene. Barrett Co. 20,707. 134,522
Explosive Compounds. Atlas Powder Co. 21,438. 134,523
Explosive Mixtures. Atlas Powder Co. 21,439. 134,524
Vaseline. Rutgerswerke Akt.-Ges. 24,047. 134,528
Degasification of Coal. Young, N. 25,276. 134,529
Alumina. Norsk Hydro-Elektrisk Kvalifikationselskab. 26,253. 134,531
Recovering Selenium and Noble Metals from Electrolytic Slimes and the Like. Chikashige, M.; and Uns, D. 26,470. 134,536

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Ferro-titanium. H. A. Blackwell, Bispham, Lancashire. British Patent, 131,675, of 1918.

Carbon-free ferro-titanium is obtained from ilmenite, by the thermo-aluminic or analogous process, by preheating

separately the ilmenite and aluminium or like reducing-agent, mixing them, and setting the heated mixture into reaction. Instead of preheating both the ilmenite and the reducing-agent, the ilmenite alone may be preheated before mixing with the reducing-agent. Low-grade ilmenite may be employed.

Cellulose Acetate Solutions, Etc. R. Gilmour and W. Dunville and Co., Belfast. British Patent, 131,647, of 1918.

Acetaldehyde, alone or mixed with other solvents or non-solvents, is employed as a solvent for cellulose acetate; suitable added solvents are acetic acid, acetone, or ethyl acetate; suitable added non-solvents are methyl or ethyl alcohol, benzene, or amyl, butyl, or isobutyl acetate. The solutions so obtained may be used as varnishes, lacquers, or dopes; in an example, cellulose acetate is dissolved in a mixture of acetaldehyde, ethyl acetate, and benzene. The mixture of acetaldehyde with other solvents or non-solvents may also be employed for joining together the surfaces of articles made of cellulose acetate or compositions thereof; examples of mixtures for this purpose are (1) acetaldehyde, acetic acid, and isobutyl acetate; (2) acetaldehyde and ethyl acetate.

Distilling Oils, Etc. E. Whittaker. Deepcar, Sheffield. British Patent, 131,365, of 1918.

Apparatus for distilling oils, etc., consists of a tubular film evaporator L, a tubular preheater E arranged below the evaporator and heated by the residues therefrom, and a dephlegmator or fractional condenser consisting of an annular chamber H encasing the evaporator and preheater. The oil enters the apparatus by a pipe A, rises through the space

around the tubes of the preheater E, and passes through openings in the upper tube-plate into an annular chamber G surrounding the evaporator L. It next overflows the wall J of the evaporator L and passes down the inner walls of the externally heated evaporator tubes in thin films. The residues flow through the preheater tubes and emerge by a pipe D. Open or close steam may be introduced into the chamber U between the evaporator and preheater. The vapours generated in the evaporator enter the upper end of the annular dephlegmator H. Condensates are collected in U-shaped rings B, and the vapours are made to bubble through the condensates by means of similar inverted rings P with serrated outer edges. A uniform distribution of the oil entering the tubes is ensured by fitting the upper ends of the tubes with a sleeve of the construction shown in Fig. 3; these sleeves may be provided with hoods. The tubular film evaporator may be replaced by a vessel consisting of two concentric rings of plates forming an annular heating-chamber and provided with a liquid-distributing device. Horizontal baffles may be provided in the space around the tubes of the preheater; these baffles consist of plates formed with apertures through which the tubes pass, leaving an annular space between the tubes and the rims of the apertures.

Filtering Medium. J. Wetter, London. (A communication from M. Weinrich, New York.) British Patent, 132,164, of 1919.

A carbonaceous filtering-medium is obtained by mixing molasses or other solutions containing sucrose, glucose, etc., with lime, comminuting the hard mass obtained, drying, and calcining, cooling the burnt material, and then either removing the free lime by washing and boiling with dilute hydrochloric acid or rendering it insoluble by means of phosphoric or carbonic acid. Insoluble materials, such as calcium phosphate, fuller's earth, kaolin, fireclay or other clay, and kieselguhr, may be added with the lime in the original mixture. Powdered caustic or slaked lime or a mixture of these is used, the proportions of the materials, the density of the solution treated, and the temperature of treatment being varied accordingly. Milk of lime may be used instead of

powder. The final product, obtained when lime only is added and the free lime afterwards removed by hydrochloric acid, is stated to be an almost pure carbon applicable for the manufacture of printer's ink. The filtering-medium may be revived after use as described in Specifications 6347/13 and 106,519.

Sulphonic Acids. H. D. Gibbs, Cherrydale, Virginia; J. A. Ambler, Norwich, Connecticut; and Selden Company, Pittsburgh, Pennsylvania, U.S.A. British Patent, 131,970, of 1918.

Aromatic hydrocarbons are continuously sulphonated by passing their vapours up through a descending stream of hot sulphuric acid; a tower containing baffle-plates, pebbles, or pumice may be used. The tower may be kept at temperatures at or above the boiling-point of the hydrocarbon, or by using reduced pressure, below the boiling-point. Examples are given of the production of benzene monosulphonic acid, toluene-*p*-sulphonic acid, toluene disulphonic acid, naphthalene-2-sulphonic acid, and naphthalene-2 : 7-disulphonic acid.

Percarbonates. H. Wade, London. (A communication from Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler; Frankfurt-on-Main, Germany.) British Patent, 131,930, of 1917.

Alkali percarbonates are rendered stable by adding to the reagents used in their preparation, or to the finished product, magnesium silicate or chloride, alkali silicate, or gum arabic; or one of these substances may be added during manufacture and another to the finished product. In an example, magnesium silicate or chloride or alkali silicate, or a magnesium salt together with alkali silicate are added to a solution of sodium peroxide, and carbonic acid is introduced while cooling.

Salts of Organic Bases. H. N. Morris and Co., and H. N. Morris, Manchester. British Patent, 131,957, of 1918.

Aniline, toluidine, xylidene, etc., salts are formed by atomising or spraying the base, either free or in solution or emulsion into a chamber A to mix with an acid in the form of a gas or an atomised solution. The spraying is effected by sprayers B. Excessive heat due to the reactions may be prevented by circulating cold water or brine through coils C or by admitting air or inert gas through openings C'. The solids formed are removed through a man-hole E, and vapours escape through a condenser D.

Cellulose Acetates. H. Dreyfus, London. British Patent, 132,283, of 1918.

Cellulose acetate compositions for use in making dopes, films, celluloid, artificial silk, etc., contain as solvents or plastifying-agents the liquid mixtures of isomeric xylene monomethyl sulphonamides, or xylene monoethyl sulphonamides prepared from commercial xylene which contains *o*-, *m*-, and *p*-xylene. The substances may be prepared by treating xylene with chlorosulphonic acid to obtain sulphochlorides, which are treated with amines or with ammonia to form sulphonamides, which are methylated or ethylated. Other plastifying agents, such as triphenyl phosphite or tricresyl-phosphate, may be added. To neutralise traces of acid, the aliphatic derivatives of urea, which are liquid or have a lower melting-point than urea, such as mono-, di-, or tri-methyl urea, mono- or di-ethyl urea, etc., may be added.

Dyeing and Mordanting. J. Barnes, H. Wrigley, and P. Spence and Sons, Manchester. British Patent, 132,345, of 1918.

In dyeing, staining, or mordanting textiles and leather which have been treated with tannic acid, with solutions containing mixtures of titanium and iron salts, the solutions are treated with sulphuric acid or sodium carbonate to vary the acidity or basicity so as to obtain shades varying from the yellow due to titanium alone to the grey or bluish-black due to iron alone. Glauber's salts may be added to render the basic solution stable. The iron may be present in the ferrous or ferric condition. The solutions may be used in the

production of discharge effects in printing, and as mordants for subsequent dyeing with basic or adjective colours such as alizarin, logwood, etc.

Catalytic Apparatus. G. Calvert, Twickenham Park, Middlesex. British Patent, 132,120, of 1918.

In apparatus for carrying out catalytic reactions wherein one of the reacting bodies is vaporised in a boiler and the vapour is mixed with a regulated supply of the other reacting gas at the entrance of the tube containing the catalyst, the vapour is preheated by passage through a coil of piping surrounding the catalyst tube. Two constructions of apparatus for oxidising ethyl alcohol to acetaldehyde are described, identical with the apparatus for oxidising methyl alcohol to formaldehyde described in Specification 126,479.

Explosives. J. Hargreaves, Widnes; C. R. Gardner, Gathurst, near Wigan; and Roburite and Ammonal, Ltd., London. British Patent, 131,380, of 1918.

Consists in the use of dehydrated ulmin or ulmic anhydride in explosive compositions, or in admixture with or as a coating on explosive granules. Ulmin may be prepared by treating decomposed or partly decomposed cellulose with an alkali such as sodium hydrate or carbonate to form an ulmate, then with an acid such as hydrochloric acid to liberate ulmic acid, and dehydrating the mass to form the ulmic anhydride.

Benzoic Acid. F. P. Leach and United Alkali Company, Liverpool. British Patent, 132,433, of 1919.

Benzoic acid is prepared from benzyl chloride, obtained from the chlorination of toluene, by heating it with an alkali to a temperature of 80-90° C. and passing in chlorine, followed by acidulation in the usual manner.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Concentrating Ores. T. H. Palmer, Melbourne; and H. V. Seale and R. D. Nevett, Broken Hill, New South Wales. British Patent, 132,260. Convention date, September 2, 1918.

A flotation process is carried out in the presence of a small proportion of free sulphur with or without a frothing-agent. The liquor may be acid, neutral, or alkaline, and, in the treatment of mixed sulphides, after the flotation of one mineral has been effected, a second mineral may be recovered by varying the conditions as regards temperature, acid, frothing-agent, etc. The sulphur may be mechanically mixed with the materials, or may be used as a solution in oils, tar, etc. In cases in which ores are sulphidised to render them amenable to concentration by flotation, free sulphur may be added to accelerate the action of the sulphuretted hydrogen or other sulphidising-agent used.

Esters. J. Grolea, Seine, France; and J. L. Weyler, Paris. British Patent, 131,678. Convention date, February 23, 1918.

Esters are prepared from aliphatic acids and alcohols, the more volatile of which pair of reagents boils sufficiently above 100° C. to admit of separation of water therefrom by fractional distillation, by heating the two reagents without a dehydrating agent or catalyst in a distilling vessel provided with a fractionating column, the water produced in the reaction being thus continuously removed while the more volatile component, which is used in excess, is returned to the reaction vessel; practically theoretical esterification of the less volatile component is thus obtained. Examples are given of the preparation of triacetin and dibutyl tartrate; diisoamyl tartrate, dibutyl citrate, diisobutyl citrate, and diisoamyl citrate are prepared similarly.

Extracting Bitumen. Rütgerswerke Akt.-Ges, 33, Lutzowstrasse, Berlin. British Patent, 131,588. Convention date, August 9, 1918.

Bituminous constituents are extracted from coal by digestion with tar oil at a temperature of 300-350° C. Anthracene oil is heated to 200° C. and small coal is added, and the mixture is stirred and heated up to 350° C. Volatile oils may be exhausted and condensed, and after several hours the mass is allowed to cool to 200° C., when a further quantity of tar oil is added, and the resulting solution is separated from the residue. The latter may be washed with tar oil,

etc., and utilised as a fuel or road material. The solution is distilled to recover the solvent oil and produce a pitch; distillation in high-pressure steam yields a viscous oil similar to that obtained by carbonising coal at low temperature, and suitable for use as a lubricant. The solution can also be used for asphaltting streets, roofing purposes, insulating material, and as a liquid fuel, a reducing agent, or a paint.

Separating Gaseous Mixtures by Liquefaction. E. Barbet and Fils and Cie, Paris. British Patent, 131,321. Convention date, January 31, 1917.

In a process for separating in a pure state and in a single continuous operation substantially the whole of the nitrogen and oxygen by subjecting air partly in the liquid state and partly in the gaseous state to continuous rectification, the liquid air and the air cooled to near the point of liquefaction are obtained by utilising the cold units of the pure gases obtained. The nitrogen issuing from the top of the rectifying column is compressed, cooled, and liquefied, and after the neon, hydrogen, and helium have been freed from it by expansion, it is returned in a liquid state to the top of the rectifier; about half of the nitrogen returned is withdrawn from the second or third plate of the rectifier for industrial use; the argon is withdrawn in a liquid state from the plate where it has a maximum concentration; a portion of the liquid at the bottom of the rectifier is withdrawn to remove xenon and krypton; pure oxygen is extracted for use a few plates above the bottom of the rectifier; and losses due to radiation are made good by supplementary condensation of gases between the point of supply of the rectifier and the point at which the argon is withdrawn. In the apparatus shown for carrying out the process, gaseous nitrogen from the top of the rectifying-column A passes through a heat-exchanger H to a pump J, the heat of compression is removed, and the nitrogen passes through the heat-exchangers H, B, I where it is liquefied. This liquid nitrogen passes through a separator *b* where the neon, hydrogen, and helium are allowed to escape and the liquid is returned at *n* to the top

of the column A. The pure nitrogen for use is withdrawn in the liquid state from the second plate of the rectifier at *m* and passes through the heat-exchangers B, C, D to cool the nitrogen to be liquefied and to cool compressed air from a reservoir R, the pure gaseous nitrogen passing through a meter M. By driving the pump J at a higher speed, the liquid nitrogen returned at *n* to the column A can be increased without increasing the amount of pure nitrogen withdrawn from the apparatus. The compressed air cooled in the heat-exchanger C passes through a heat-exchanger E containing liquid from the bottom of the column. This liquid is thereby boiled and causes boiling in all the plates of the column, the compressed air being liquefied and after passing through a valve *e* and the heat-exchanger I is passed partly in the gaseous state to the air supply plate *a* of the column. The pure gaseous oxygen for use is extracted at *Ox* a few plates from the bottom of the column and passes through heat-exchangers F, G to a meter M'. Compressed air from the reservoir R passes through the heat-exchangers G, F to the heater E and is liquefied with the compressed air from the heat-exchanger C. Argon is eliminated by withdrawing liquid at the point *Ar*. Xenon and krypton are eliminated by withdrawing liquid at X from the bottom of the column. Vapour from a plate between the supply plate *a* and the point at which argon is withdrawn is condensed in a vessel U supplied with liquid air and is returned to its

plate. In a modified form of the apparatus, the nitrogen escaping from the top of the column is passed through heat-exchangers, compressed, and liquefied by passing it through the heat-exchanger E. The gaseous oxygen withdrawn from the apparatus passes through the heat-exchangers to cool air, which is supplied in the gaseous state to the supply plate *a* of the column. Liquid air is also supplied to this plate, the liquefaction being effected in heat-exchangers by the cold units of the pure liquid nitrogen withdrawn for use.

Sulphonic Acids. E. Barbet and Fils and Cie, Paris. British Patent, 132,298. Convention date, June 26, 1917.

The process of sulphonating benzene described in the parent Specification is applied to the sulphonation of other aromatic hydrocarbons, such as naphthalene. In sulphonating naphthalene, the hydrocarbon is vaporised by means of hot combustion gases instead of steam, and the condenser for the naphthalene vapours from the sulphonating-vessel is kept warm to prevent crystallisation.

Ammonium Alum. R. Gans, Berlin. British Patent, 132,510. Convention date, September 21, 1917.

Ammonium alum is obtained comparatively free from iron by adding to aluminium sulphate solution containing ferric sulphate, an excess of ammonium sulphate, and a sufficient quantity of a base such as ammonia, to convert the ferric salt to a basic salt which is maintained in solution by the excess of ammonium sulphate, while the ammonium alum is allowed to crystallise during agitation to obtain small crystals.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Cambria Tinplate Company, Ltd.—Resolved October 6, confirmed October 22: That the company be wound up. J. S. C. Taylor, Russell Buildings, 13, St. Mary Street, Swansea, chartered accountant, liquidator. Meeting of creditors at liquidator's, November 10. Claims to liquidator by December 15.

Motor Sheet Metal Company, Ltd.—Claims to P. E. Slack, 16, Great James's Street, Bedford Row, W.C., liquidator, by December 1.

Rubel Bronze and Metal Company, Ltd.—Claims to H. S. Foster, 82, Victoria Street, Westminster, S.W., liquidator, by December 10.

Wailles Dove Bitumastic, Ltd., Newcastle-on-Tyne.—Resolved October 7, confirmed October 23: That it is desirable to reconstruct the company, and, accordingly, that the company be wound up. F. H. Hunter, Newcastle-on-Tyne, secretary, of the company, liquidator, who is authorised to consent to the registration of a new company, to be named Wailles Dove Bitumastic, Ltd. Meeting of creditors, November 10. Claims to liquidator at 5, St. Nicholas Buildings, Newcastle-on-Tyne.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

France.

An import and export company in France are desirous of getting into touch with United Kingdom manufacturers of manures, fertilisers, etc., with a view to acting as agents for the sale of such articles in the South of France. (Reference No. 999.)

COMING EVENTS.

Institution of Petroleum Technologists.—Meeting, Tuesday, November 18, at 5.30 p.m., at the House of the Royal Society of Arts, John Street, Adelphi, W.C. 2. Paper: "The Conservation of Oil," by Rear-Admiral (Retd.) Philip Dumas, C.B.

Sweden.

A firm of commission agents in Gothenburg, who claim to be well connected with buyers in Sweden, are desirous of representing British firms in chemicals. (Reference No. 1014.)

Brazil.

A well-established firm of merchants, with branches in Brazil and selling organisation, wish to represent United Kingdom manufacturers of heavy and fine chemicals. Com-

munications should be addressed to the Secretary, Statistical and Information Department, London Chamber of Commerce, 97, Cannon Street, London, E.C. 4.

Chili.

A British subject in Santiago de Chili is desirous of representing British manufacturers in the following articles: White zinc paint (paste), cement, explosives, and fulminants. (Reference No. 1021.)

MARKET REPORTS.

GERMAN CHEMICAL MARKET.

The following market report is issued from Frankfort, accompanying a general statement on the situation: Fine silver has been dealt in at 810 marks per kilogramme, whilst nitrate of silver, chemically pure, is offered at 560 marks. It is known that even at these high prices inquiries from consumers' circles are insistent. The price of platinum too has gone higher. Only small quantities are now available at the price of 105 marks per gramme. Borax powder and crystals could be had at 9.50 marks per kilogramme, and boric acid was offered at 11.50 marks per kilogramme, but was correspondingly dearer for small quantities. Alum powder was obtainable at 90 marks per 100 kilogrammes, and crystals at about 120 marks per kilogramme. Sal ammoniac (white) was quoted at 420 marks per 100 kilogrammes. The prices for bromine preparations tended upwards. Bromide of potash was offered at 40 marks per kilogramme, whilst ammonia bromide, etc., were neglected at lower prices. These are being exported in large quantities abroad. Dibasic phosphate of soda was asked for at 4.26 marks, and tribasic at 4.15 marks per kilogramme. Sulphate of soda was hard to obtain. Concentrated goods were quoted at 175 marks per 100 kilogrammes. Sulphate of alumina could only be dealt in in small quantities at 68 marks per 100 kilogrammes. Carbon disulphide was sold in small quantities at 270 marks per 100 kilogrammes. Cyanide salts have gone dearer. Yellow prussiate of potash made 5.65 marks; whilst red prussiate of potash was offered at 15 marks per kilogramme. Permanganate of potash has become dearer, and is now fetching 54 marks per kilogramme. Chloride of calcium (90/95%) rose rapidly in price. It is now 55 to 60 marks per 100 kilogrammes, but consumers do not show any readiness to pay the price. Hydrogen peroxide, 30%, fetched 8.50 marks per kilogramme. The demand for chemicals required for preservation purposes is limited. Benzoic acid sublimate was offered at 20 marks, and benzoate of soda 19.70 marks per kilogramme. Formic acid, 50%, chemically pure, made 300 marks, and 85% technical, 400 marks per 100 kilogrammes. Oxalic acid was much inquired for; the price rose to about 500 marks per 100 kilogrammes. Acetone, chemically pure, is being dealt in 8.50 marks, per kilogramme.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d., naked; pure, 3s., naked, at works. Carboic acid, crude, 60%, East and West Coast, nominally 1s. 7d. to 1s. 8d.; crystals, 39-40%, 3½d. to 9d., f.o.b. Crude tar, London, 45s. to 50s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Refined tar, 32s. 6d. per barrel. Pitch, 80s.; East Coast, 70s. to 75s., f.o.b.; West Coast, 62s. 6d. to 65s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-160%, naked, London, 2s. 5d.; North, 2s. 2d. to 2s. 3d. Crude naphtha, naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthalene, £16. to £18.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 5½d.; heavy oil, 6½d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 7d. to 2s. 8d., ex works. London, and f.o.b. other ports. Sulphate of ammonia: home trade, November £20. 15s., basis 24½%. Nitrate of soda, £22. to £22. 10s.

FERTILISER MATERIALS. LIVERPOOL, THURSDAY.

Nitrate of Soda.—There is no change in either the tone of the market or in the price of this material, the quotation on spot for 95/96% quality remaining at £20. 2s. 6d. per ton, net cash, f.o.r. for prompt delivery. East Indian Bone Meal.—Shippers of this material maintain a firm attitude, the quota-

tion for November-December shipment being £17. 10s. per ton, net cash, ex ship Liverpool, for 4½% ammonia, and 52% phosphates. On spot Liverpool, holders require £17. 10s. per ton, net cash, for 4½% and 45% quality. Mineral Phosphates.—There is no change to report in this market and values at present are only nominal. Dried Blood.—This article is very scarce and full prices are being paid for any parcels available, the value being about 32s. 6d. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £100. 15s. 0d. to £101. 0s. 0d., cash; £102. to £102. 5s. 0d. three months; electrolytic, £112. to £117. Tin: Standard, £281. 15s. 0d. to £282. cash; £282. 15s. 0d. to £283. three months; Straits, £282.; English, £281. to £282. Lead: Soft foreign, £34. 10s. 0d.; English, £35. 10s. 0d. Spelter, £47. 10s. 0d.; hard, £33. to £34. Antimony, English regulus, 90%, £47. 10s. Aluminium, £150. Nickel, £205., delivered; packages extra. Quick-silver, £17. 5s. to £17. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 32s. 6d. per unit.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

The demand continues good for all heavy chemicals, both for home and export trade. Values generally are well maintained. Caustic soda, 70%, in strong request at £24. 10s. to £25. per ton. Makers are well engaged with orders for bleaching powder, and price firm at £17. softwoods, on rails. High prices are being obtained for resale parcels of bicarbonate soda and 58% alkali, and supplies are short. Chlorate of soda is in fair inquiry at 6d. per lb. Potash quiet at 1s. per lb. Roasted saltcake unchanged at 70s. per ton, carriage paid. Recovered rock sulphur, £17. on rails. There is very little improvement in demand for copper sulphate, and price easy at £40. per ton f.o.b. Borax continues scarce and dear. Hypo-sulphate of soda (commercial) firm at £19. per ton. Commercial sodium sulphide in good request, and price higher at £23. in drums. Phosphate of soda £28. per ton. White powdered arsenic still short, and price firm at £60. per ton. Yellow prussiate of potash only moving slowly at 1s. 9d. per lb. Soda is well inquired for, and price dearer at 1s. 1d. per lb. Acetic acid and acetate of soda are unaltered at recent rates. Owing to the advance in metal, lead salts have an upward tendency. White is now £84. Brown £68. and nitrate £55. per ton. English brown and grey acetate of lime is also higher at £12. 10s. and £19. per ton respectively. Miscible wood naphtha 10s. 6d. per gallon. Barium chloride is only selling slowly, and price easy at £23. per ton. Nitrate of soda scarce and dear at £60. per ton. Oxalic acid steadier at 1s. 1½d. per lb. delivered. Green copperas in better demand, but price unchanged.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplates are in strong demand, and prices have advanced to 44s. to 45s. per standard box f.o.b. Swansea. Copper is somewhat easier, and fairly active at £100. cash and £101. 5s. three months. Tin easier at £279. 5s. prompt, and £279. 10s. three months. Lead more active and firmness well maintained at £33. 12s. 6d. for Spanish and £34. 10s. for English. Spelter had a steady trade at £44. 15s. per ton over next two months. Zinc sheets firm at £67. per ton for English, and Americans easier at £66. 10s. at New York. Antimony very steady at £47. 10s. Aluminium £150. Quicksilver £17. 10s. per bottle. Silver 68½d. per ounce. Nickel £205, delivered London or equal. Palm oil steady: Lagos £87.; softs £86. 10s.; Benin, £86.; and hards £84. per ton. Turpentine steady at £6. 8s. 6d. per cwt. Linseed oil quiet, and rather scarce. Sulphate of copper steady, with small sales at £40. per ton f.o.b. Sulphate of ammonia very steady at £20. 15s. per ton

for this month's delivery. Nitrate of soda quiet at 21s. 6d. per cwt. in bags. Bone meal quiet at £17. 10s. per ton net. Pitch remains rather scarce at 62s. 6d. per ton at ship. Oxalic acid remains quiet at 1s. 0½d. per lb. Arsenic in poor demand at £58. per ton for white powdered f.o.b. Linseed oil scarce at 91s. per cwt. net cash.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on November 8 were: American, 33,932 barrels, compared with 3,501 barrels at the corresponding date of 1918; French, 1,074 barrels (797 barrels); and Spanish, 318 barrels (1,140 barrels). Deliveries during the week ended November 8 were 1,790 barrels, against 665 barrels last year, and since January 1, 64,047 barrels, compared with 21,940 barrels in 1918. The price on Saturday last was 126s. 9d. per cwt., compared with 105s. at the corresponding date of last year. November-December delivery was quoted at 127s. 6d., and January-April (1920) 129s. 3d.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

Business in chemicals has again been active, an improved demand having been made for supplies on export account. The strike in the United States has caused a number of inquiries to be made at Liverpool for supplies on U.S. account, but local makers and sellers have not been able to meet these in any large way, owing to the shortage of stocks at hand, or likely to be at an early date. Bleaching powder has been more inquired for and available stocks are small. The quotation for home trade uses is £17. per ton, free on rail or conveyance, in buyers' packages, and for export, £15. to £18. per ton. Chloride of calcium has been in fair request, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has met with a brisk inquiry, an increased demand on Continental account having been made. For 76%, £24. per ton is being quoted; for 70 to 72%, £22. per ton, and for 60 to 62%, £21. per ton. Nitrate of soda has sold rather more freely, and is £21. to £22. per ton. Saltcake has been in very fair request, and is £6. 10s. per ton in casks, f.o.b. Soda crystals have been well inquired for, and are £5. 10s. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been in fairly brisk demand, and is £8. 5s. to £10. per ton, according to terms of delivery. Borax has been in good request, and is £39. per ton for ordinary, and £40. per ton for powdered, in bags, less 3% for lots of not less than 50 tons. Ammonia alkali has met with an active inquiry, and is £6. 10s. to £6. 15s. per ton, f.o.r. at works. Hyposulphite has been in moderate request, and is £18. 10s. per ton for ordinary, and £22. per ton for pea crystals in 1cwt. bags. Sulphite of sodium has been in quietly steady demand, and is £10. per ton for ordinary, and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been in fair request, and is £22. per ton in casks, and £23. per ton in drums. Prussiate of soda has been quiet, and is 11d. to 1s. per lb. Bichromate of soda has been in moderate request, and is 9½d. per lb. Phosphate of soda has been in limited demand, and is £26. per ton. Chlorate of potash has been more inquired for, and is 1s. to 1s. 1d. per lb. Permanganate has been in quietly steady demand, and is 3s. 6d. per lb. Sulphate of potash has been quiet, and is £25. per ton. Carbonate of potash has been in very fair request, and is £95. to £100. per ton for 80 to 85%. Caustic potash has sold somewhat freely, and is £120. per ton. Nitrate of potash has been rather more in request, and is £55. to £60. per ton for refined, and £40. per ton for ordinary. Canadian potashes have been quiet. First quality Montreal are £200. to £220. per ton and second quality, £190. to £210. per ton. Bichromate of potash has been more inquired for, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been in fair demand, and is 1s. 9d. to 1s. 10d. per lb. Salammuniac has been steadily called for, and the supply, at hand, has been very limited. Prices have advanced and are: £90. per ton for first quality; £85. for second quality, and £5. per ton extra for crushed. Sulphate of ammonia has been quieter. Prices are: £20. 15s. per ton, for November; £21. for December; £21. 7s. 6d. for January, 1920; £21. 15s. for February, and £22. per ton for March to May, 1920. Carbonate of ammonia has been in fair request, and is 6½d. per lb. Muriate has been but little called for, and is £18. to £50. per ton. Magnesia has been rather more in request. Carbonate is £2. 5s. per cwt., and sulphate £11. to £16. per ton, according to grade. Alum has been in very fair demand, but has again been in small supply for prompt or early deliveries; £18. 10s. per ton is quoted for

home trade uses, and £18. 10s. to £19. 10s. per ton, for export. Aluminoferric has been very quiet, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been in moderate request, and is £12. to £17. per ton according to grade. Sulphur has been in good request. English flowers are £32 per ton, roll is £28. per ton and rock, £22. per ton, in bags, f.o.r. Sicilian grades are; flowers, £28. per ton; roll, £22. 10s. per ton, and rock, £17. 15s. per ton. Cream of tartar has been in quietly steady demand, and is £12. to £12. 5s. per cwt. Tartaric acid has been in fair request, and is 3s. 2d. to 3s. 3d. per lb. Boracic acid has been rather more in demand. Crystals are £72. per ton, and powdered, £74. per ton. For delivery in casks, from £2. to £3. per ton extra is charged. Oxalic acid has been quieter, and is 1s. to 1s. 1d. per lb. Citric acid has been in moderate request, and is 4s. 3d. per lb. White acetate of lead has been but little in request, and is £83. per ton. Arsenic has again been in fair request, and is £58. to £60. per ton for white powdered. Sulphate of copper has been more inquired for, and is £40. per ton for the home trade, and £40. to £41. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Market continues very firm, and there is a steady demand for home and export, caustic soda and bleaching powder in particular. Locally soda crystals are in strong request at £5. 10s. per ton 2cwt. bags. Sulphur remains scarce and firm at £22. per ton.

The following prices are per ton net:—Bleaching powder, softs and hards, £17.; caustic soda, 76/77%, £24.; 74/76%, £23. 10s., do., 70%, £22. 5s., do., 60%, £21. 10s.; recovered sulphur, 2cwt. bags, £22.; hyposulphite of soda, 5/7cwt. casks, £19., 1cwt. kegs, £25.; sulphite of soda, 5/7 casks, £12., do., 1cwt. kegs, £20.; silicate of soda, 75Tw., £9. 12s. 6d., do., 100Tw., £10.; do., 140Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda (saltcake), in bulk, £4.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22. sulphide of sodium, crystals, £18., do., refined concentrated solid, 60/62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market very firm and the position of collieries generally is satisfactory. Business is active and there is more trade than can be dealt with. To-day's quotations: Best Northumbrian steam coals, 95s. to 100s. per ton, seconds, 90s. to 95s.; Northumbrian small coals, 75s. to 80s., seconds, 67s. 6d. to 72s. 6d.; best Durham gas coals, 80s. to 85s., seconds, 65s. to 75s.; Durham bunkers, 70s. to 80s., seconds, 65s. to 67s. 6d.; foundry coke, 100s.; gas coke, 95s. to 100s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

There continues a good demand for all classes of chemicals, and during the past week the volume of business has been steadily increasing. Prices are of a fluctuating character, with the tendency being decidedly upward, and in this connection it may be mentioned that arsenic is now quoted at £64. (as against £62. per ton previously); bicarbonate of soda £10. 10s. and £12. 10s. for 6-8cwt. casks and 1cwt. kegs (as against £9. 15s. and £10. 10s. previously); salammuniac, £95. and £85. (as against £90. and £85. previously); and saltpetre, £3. 2s. (as against £3. previously). Current quotations now stand as follows: Arsenic, £64. per ton, net, Glasgow; bicarbonate of soda, £10. 10s. and £12. 10s. per ton for 6-8cwt. casks and 1cwt. kegs, net. Liverpool; boracic acid crystals, English refined, £72 for 2cwt. bags; and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £25. per ton net, Glasgow; chlorate of potash, 1s. 1d. per lb., net, Glasgow; chloride of soda, 8d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 98%, £11. 15s. per cwt., net, Glasgow; paraffin wax, U.K. deliveries, 1250, 6½d. to 6½d.; 121-30, 5½d. to 5½d.; 118-200, 5d.; 110-120, 4d. to 4½d.; and 98-1020, 4d. to 4½d.; salammuniac, £95. and £85. per ton, net, any port, for first and second lump respectively; salammuniac crystals, £70. per ton, net, Glasgow; saltpetre, £3. 2s. net, Glasgow; tartaric acid, 3s. 3d. per lb., 5%, Glasgow.

Among the whale oils business is also good, and some big deals are reported as having been transacted during the past week. The whale oils continue to show much the old level of values, but pale is now stronger at 94s. as against 92s. previously. Brown and black, however, still keep to the former level of 76s. and 74s. respectively; while yellow is still conspicuous only by its absence. Newfoundland cod is

still on offer at 80s. (its old price); and there are no changes recorded as far as pale seal is concerned at 96s. and Menhaden at 80s.

In the coal trade everything is moving on the old lines with, if anything, an increasing demand for all classes of fuel.

There is now a cold snap in the air which has caused an expansion of the demand from the domestic standpoint, and industrially there is plenty of work going on in the different local shipbuilding, engineering and other works to call for a big consumption of fuel.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

Yokohama, 5 t., \$300.

AMMONIUM CHLORIDE—
Canton, 1 cs., \$7.; Calcutta,
1 cs., \$9.; Penang, 1 cs., \$4.;
Sydney, 1 ck., \$6.

AMMONIUM CITRATE
Calcutta, 1 cs., \$18.

AMMONIUM HYDRATE—
Calcutta, 1 cs. (pt.), \$21.

AMMONIUM HYDROSULPHIDE—
Brussels, 3 cs., \$13.

AMMONIUM IODIDE—
Piraeus, 3 cs. (pt.), \$8.

AMMONIUM MURIATE—
Smyrna, 6 c., \$30.

AMMONIUM PERSULPHATE—
Yokohama, 4 cs. (pt.), \$10.

AMMONIUM PHOSPHATE—
Montreal, 7 cks., \$150.; Piraeus,
1 ck., \$14.

AMMONIUM VANADATE—
Yokohama, 4 cs. (pt.), \$18.

AMYL ACETATE—
Hong Kong, 3 cs., \$89.; Paris,
7 drms., \$105.

AMYL ALCOHOL—
Yokohama, 2 cs., \$21.

AMYL NITRITE—
Santiago, Chili, 1 cs., \$6.

ANTIMONY SULPHIDE—
Copenhagen, 1 ck., \$28.; Dun-
kirk, 7 cks., \$147.; Genoa,
7 cks., \$137.; Halmstad, 1 ck.,
\$24.; Montreal, 2 cks., \$125.;
Paris, 13 cks., \$240.

ANTIMONY TARTRATE—
Copenhagen, 1 ck., \$18.

ARSENIC—
Bordeaux, 9 t. 4 c., \$478.
Malta, 2 c., \$9.
Rio de Janeiro, 1 t., \$90.

ARSENIC HYDROCHLORIDE
Calcutta, 1 cs., \$5.

BARIUM HYDRATE—
Antwerp, 1 ck., \$9.

BARIUM NITRATE—
Barcelona, 1 ck., \$15.

BARIUM SULPHIDE—
Bombay, 3 cs., \$25.; Calcutta,
3 cs., \$22.

BENZOIC ACID—
Calcutta, 1 cs. (pt.), \$8.

BENZYL CHLORIDE—
Brussels, 1 drim., \$83.

BISMUTH—
Bombay, 3 cs., \$232.; Calcutta,
2 cs., 3 cs. (pt.), \$376.; Lisbon,
1 cs. (pt.), \$18.; Monte Video,
1 cs., \$18.; Perth, 1 cs., \$6.

BISMUTH CARBONATE—
Cape Town, 1 cs., \$16.; Calcutta,
1 cs. (pt.), 3 cs., \$197.; Santiago,
Chili, 1 cs., \$56.

BISMUTH SALTS—
Shanghai, 1 cs. (pt.), \$18.

BISMUTH SUBNITRATE—
Calcutta, 1 cs. (pt.), \$33.

BLEACHING POWDER—
Bombay, 3 c., \$14.

BORAX—
Aden, 6 c., \$13.; Antwerp, 15 t.,
\$805.; Bombay, 5 t., \$195.;
Barranquilla, 10 c., \$23.; Colon,
4 c., \$10.; Dantzig, 10 t., \$550.;

\$25.; Stockholm (F.), 2 t., \$144.;
Tientsin, 3 c., \$19.

CALCIUM CARBIDE
Channel Islands, 1 t. 15 c., \$75.

CALCIUM CHLORIDE—
Colombo, 10 c., \$7.; Marseilles,
1 t. 3 c., \$12.

CALCIUM HYPOPHOSPHITE—
Bombay, 2 cs. (pt.), \$12.; Genoa,
2 cs., \$78.; New York, 80 cs.,
\$1,680.; Toronto, 1 cs., \$45.

CARBON BISULPHIDE

Durban, 6 cs., £21.; Copenhagen, 20 drms., £30.

CARBON TETRACHLORIDE

Antwerp, 1 drin., £35.

CERESINE WAX

Yokohama, 12 c.

CHEMICALS (otherwise undescribed)

Autofagasta, 1 cs., £11.; Antwerp, 4 pkgs. (pt.), £1,302.; Auckland, 2 pkgs., £30.; Bangkok, 1 cs., £20.; Canton, 2 cs., £19.; Buenos Ayres, 3 cs. (pt.), £22.; Calcutta, 1 cs., £17.; Dominica, 1 cs., £24.; Durban, 12 cs., £61.; East London, 9 cs., £57.; Haifa, 1 cs., £8.; Malta, 2 cs., £10.; Penang, 1 cs., £13.; Perth, 3 cs., £42.; Pt. Elizabeth, 1 cs., £11.; Rio de Janeiro, 1 cs., £16.; Sydney, 9 cs. (pt.), £208.; Tientsin, 1 cs., £18.; Trinidad, 6 cs. (pt.), £33.

CHLORIDE OF LIME

Pernambuco, 17 c., £16.

CITRIC ACID

Amsterdam, 10 c., £226.; Spain, via Calais, 1 t., 19 c., £937.; Callao, 1 c., £27.; Cologne (F.), 1 t., £504.; Melbourne, 1 cs. (pt.), £5.; Montreal, 3 t. 15 c., £1,696.; Perth, 1 cs., £23.; Pt. Elizabeth, 2 c., £45.; Sydney, 2 t., £862.; Valencia (F.), 2 c., £49.

COAL PRODUCTS

Alizarine
Bombay, 105 cks., £3,317.; New York, 5 cks., £128.

Aniline Colour
Genoa, 35 kgs., £1,336.

Aniline Dye
Amsterdam, 4 kgs., £69.; Bombay, 188 pkgs., £7,731.; Brussels, 1 ck., £34.; Cape Town, 3 pkgs., £50.; Gothenburg, 2 cks., £180.; Mauritius, 1 cs. (pt.), £26.; Paris, 6 kgs., £88.; Port Elizabeth, 4 pkgs., £80.

Benzole
Durban, 1 cs., £9.

Bisnitrotolul
Paris, 1 ck., £28.

Bitumen
Genoa, 54 cks., £101.

Carbolic Acid
Amoy, 3 cs., £30.; Bombay, 23 cs., £66.; Channel Islands, 7 cks., £55.; Gothenburg, 4 cs., £43.; Melbourne, 5 cs., £8.; Rangoon, 74 drms., £23.; Singapore, 5 cks., £29.; Taganrog, 20 cs., £125.

Cresosote
Amsterdam, 25 cks., £93.

Cresylic Acid
Melbourne, 20 drms., £21.

Naphthalene
Aden, 4 kgs., £18.; Montreal, 58 cks., £216.; Pt. Elizabeth, 2 cs., £15.; Taganrog, 20 cks., £186.

Nitronaphthalene
Lisbon, 1 kg., £35.

Paranitraniline
Paris, 35 cks., £88.

Pitch
Alexandria, 400 brls., £337.; Calais, 236 t., £1,003.; Mauritius, 25 brls., £26.; Rotterdam, 2,600 t., £8,000.

Tar
Beira, 50 drms., £20.; Cape Town, 100 drms., £9.; Cebu, 12 drms., £26.; Delagoa Bay, 60 drms., £7.; Durban, 535 drms., £50.; Malmo, 750 cks., £1,225.; Mauritius, 15 runlets, £33.; Pt. Elizabeth, 183 drms., £24.; Pt. Sudan, 20 drms., £16.

Tar Oil
Dunkirk, 136 cks., £263.

Toluol
Bangkok, 1 cs., £7.

COPPER SULPHATE

Salonica, 1 t., £45.

COPPER SULPHOCYANIDE

Copenhagen, 5 drms., £31.

COPPERAS

Brussels, 4 cks., £7.

CREAM OF TARTAR

Adelaide (F.), 1 t. 13 c., £379.; Barranquilla (F.), 6 c., £88.; Bombay, 2 t. 3 c., £556.; Brussels, 4 c., £39.; Beira (F.), 1 cs., £6.; Copenhagen, 2 c., £25.; Delagoa Bay (F.), 2 c., £50.; Durban, 1 cs. (pt.), £6.; Durban (F.), 4 c., £68.; Fremantle, 9 c., £118.; East London (F.), 2 c., £30.; Manta (F.), 1 cs. (pt.), £7.; Rangoon (F.), 3 c., £42.; Brisbane (transit) (F.), 8 t., £1,440.; Cairns (transit) (F.), 3 t. 6 c., £594.; Melbourne (transit) (F.), 14 t. 10 c., £2,610.; Sydney (transit) (F.), 3 t. 16 c., £684.

DISINFECTANTS (otherwise undescribed)

Aden, 18 c., £10.; Antigua, 9 c., £14.; Alexandria, 15 c., £64.; Amoy, 4 c., £5.; Bangkok, 3 c., £20.; Blantyre, 2 c., £7.; Bombay, 6 t. 2 c., £328.; Brussels, 1 t. 5 c., £47.; Cape Town, 1 t. 19 c., £109.; Durban, 1 t. 2 c., £40.; Hong Kong, 5 t. 5 c., £286.; Klang, 2 t. 6 c., £55.; Medan, 2 t. 6 c., £108.; Montreal, 3 t. 11 c., £78.; Penang, 1 t. 13 c., £75.; Pernambuco, 3 c., £8.; Pt. Elizabeth, 1 t. 13 c., £50.; Porto Alegre, 2 c., £5.; Pt. Swettenham, 2 t. 10 c., £99.; Rio de Janeiro, 4 c., £10.; Rangoon, 16 c., £16.; Singapore, 7 t. 16 c., £386.; Swatow, 4 c., £5.; Tarquah, 1 c., £7.; Tientsin, 1 c., £11.; Trinidad, 1 t. 8 c., £35.; Shanghai, 9 c., £28.

ETHER

Calcutta, 4 cs., £21.; Talcahuano, 1 cs., £16.

ETHER (METHYLIC)—
Bombay, 2 cs., £14.

ETHER (SULPHURIC)

Rangoon, 1 cs. (pt.), £6.; Talcahuano, 1 cs., £6.

FATTY ACIDS

Paris, 20 t.

FISH OIL

Ghent, 1 t. 8 c.

FORMALDEHYDE

Santiago, Chili, 2 cs., £14.

GALLIC ACID

Sydney (F.), 1 cs., £42.

GELATINE

Montreal, 1 t.; Toronto, 2 t.

GLUE

Rio de Janeiro, 7 c.; Toronto, 7 c.

GLUE, SIZE, AND GELATINE

Amsterdam, 3 c.; Antwerp, 1 t. 5 c.; Bergen, 1 t. 2 c.; Bombay, 10 c.; Cape Town, 2 t. 1 c.; Calcutta, 1 t. 19 c.; Colombo, 7 c.; Cologne, 5 t.; Copenhagen, 2 t. 17 c.; Dantzig, 1 t.; Dunedin, 2 t.; Durban, 1 c.; East London, 1 c.; Karachi, 10 c.; Melbourne, 7 c.; Paris, 1 t. 3 c.; Perth, 1 c.; Pt. Barcelona, 4 t. 6 c., £540.; Bahia, 3 c., £35.; Bangkok, 4 c., £34.; Buenos Ayres, 2 c., £30.; Calcutta, 2 c., £16.; Dantzig, 10 c., £65.; Durban, 1 c., £5.; Hong Kong, 1 c., £7.; Monte Video, 1 c., £16.; Paris, 2 t. 5 c., £250.; Peking, 1 c., £7.; Tientsin, 3 c., £26.

GLYCEROPHOSPHATES

Alexandria, 1 cs., £32.

HYDROBROMIC ACID

Colombo, 1 cs., £21.

HYDROCHLORIC ACID

Bombay, 2 c., £11.

HYDROGEN PEROXIDE

Batavia, 4 cs., £6.; Cape Town, 4 cs., £28.; Colombo, 4 cs., £17.; Italy, 1 cs., £19.; Mauritius, 12 cs., £55.

IODINE

Genoa, 4 cs., £404.; Perth, 1 cs. (pt.), £26.

IODINE (RESUBLIMED)

Bilbao, 2 cs., 1 cs. (pt.), £221.; Shanghai, 1 cs. (pt.), £16.

IRON AND AMMONIUM CITRATE

Boulogne, 1 cs., £55.; Shanghai, 1 cs., £42.; Sydney, 3 cs., £78.

IRON AND AMMONIUM OXALATE

Montreal, 2 cs., £42.

IRON & POTASSIUM TARTRATE

Calais, 1 cs., £25.

IRON CARBONATE

Sydney, 5 cs., £13.

IRON CITRATE

Amsterdam, 2 cs., £58.; Ghent, 2 cs., £62.

IRON OXALATE

Sydney, 1 cs. (pt.), £5.

IRON PERCHLORIDE

Singapore, 2 cs., £12.

IRON, POTASSIUM, & SODIUM GLYCEROPHOSPHATE

Constantinople, 5 cs., £305.

KIESERLITZ

Piraeus (F.), 10 t., £180.

LACTIC ACID

Calais (F.), 25 cks., £370.; Rostoff-on-Don, 2 cs., £150.

LEAD ACETATE

Genoa, 48 cks., £830.; Lisbon, 2 cks., £40.

LITHIUM CARBONATE

Genoa, 1 ck., £100.

MAGNESIA

Bombay, 8 cs., £275.

MAGNESIA (CALCINED)

Boulogne, 30 cs., £177.; Dunkirk, 6 cs., £57.; Las Palmas, 1 cs., £8.; Montreal, 1 cs., £6.; Rio de Janeiro, 3 cs., £46.; Santiago, Chili, 1 cs., £11.

MAGNESIUM CARBONATE

Auckland, 2 cs., £8.; Barcelona, 60 bgs., £150.; Invercargill, 2 cs., £9.; Durban, 1 cs. (pt.), £6.; Malaga, 25 bgs., £15.; Perth, 1 kg., £5.; Shanghai, 150 bgs., £375.

MAGNESIUM CITRATE

Accra, 1 cs., £9.; Buenos Ayres, 4 cs., £38.; Havana, 2 cs., £9.; Malta, 1 cs., £5.; Monte Video, 4 cs., £38.; Smyrna, 1 cs., £9.

MAGNESIUM SULPHATE

Accra, 15 c., £30.; Amoy, 5 c., £7.; Beira, 5 c., £10.; Brisbane, 1 t. 2 c., £44.; Cape Town, 10 c., £14.; Cartagena, 12 c., £29.; Colon, 6 c., £15.; Corinti, 1 t. 10 c., £71.; Durban, 9 c., £20.; Horianopolis, 1 t. 1 c., £31.; Guayaquil, 9 c., £23.; Launceston, 1 t. 3 c., £45.; Melbourne, 3 t. 11 c., £135.; Panama, 5 c., £13.; Peking, 5 c., £10.; Porto Alegre, 13 c., £34.; Secondee, 5 c., £9.; Shanghai, 4 c., £6.; Sydney, 8 t., £329.; Tientsin, 3 c., £6.

MERCURIALS

Bombay, 2 cs., £70.; Calcutta, 1 cs. (pt.), £6.; Hong Kong, 1 cs. (pt.), £8.

MERCURY OXIDE

Calais, 2 cs., £140.

MERCURY OXYDATE

Amsterdam, 1 cs., £85.

MERCURY PERCHLORIDE

Calcutta, 2 cs., £10.

METHYL ALCOHOL

Durban, 20 drms., £386.

METHYL SALICYLATE

Santos, 1 cs. (pt.), £12.

MIRBANE OIL

Antwerp, 1 drin., £7.; Lourenco Marques, 2 drms., £33.

MURIATIC ACID

Aden, 1 c., £6.; Santos, 2 t. 8 c., £143.

NICKEL SULPHATE

Antwerp, 2 cks., £28.

NITRIC ACID

Piraeus, 9 c., £63.

NUCLEIC ACID

Calais, 2 cs. (pt.), £49.

OXALIC ACID

Melbourne, 1 ck., £10.; Santiago, Chili, 1 cs. (pt.), £6.

PARAFFIN SCALE

Copenhagen, 10 t.

PARAFFIN WAX

Antwerp, 2 t.; Paranagua, 1 t. 2 c.

PHOSPHATE

Channel Islands (F.), 27 t., £81.

PHOSPHORIC ACID

Treport, 10 cs., £88.; Yokohama, 4 cs. (pt.), 2 cs., £96.

PITCH

Galatz, 10 t.

PLUMBAGO

Bangkok, 10 c.; Fremantle, 2 t. 13 c.; Piraeus, 1 t.

POTASSIUM ACETATE

Alexandria, 4 cs. (pt.), £41.; Calcutta, 2 cs., 4 cs. (pt.), £44.; Lisbon, 1 cs. (pt.), £8.

POTASSIUM BICARBONATE

Calcutta, 1 cs., £8.; Perth, 1 kg., £9.

POTASSIUM BROMIDE

Bangkok, 1 cs., £27.; Colombo, 1 cs., £12.; Bombay, 2 cs. (pt.), £35.; Hong Kong, 1 cs., £6.; Melbourne (F.), 1 cs. (pt.), £10.

POTASSIUM CHLORATE

Galatz, 2 c., £50.

POTASSIUM CITRATE

Bombay, 1 cs., £26.; Lisbon, 1 cs. (pt.), £5.; Hong Kong, 4 cs. (pt.), £7.

POTASSIUM CYANIDE

Bombay, 1 cs. (pt.), 1 cs., £15.; Calcutta, 2 cs. (pt.), 6 cs., £75.; Calais, 10 cs., £125.

POTASSIUM FERROCYANIDE

Bangkok, 2 cs., £58.; Melbourne, 1 cs. (pt.), £7.; Hong Kong, 1 cs. (pt.), £10.

POTASSIUM IODIDE

Amsterdam, 1 cs., £168.; Bangkok, 3 cs., £221.; Genoa, 28 cs., £2,307.; Rio de Janeiro, 2 cs., £198.; Tarquah, 1 cs. (pt.), £7.; Shanghai, 1 cs., £77.

POTASSIUM METABISULPHITE

Buenos Ayres, 25 cks., £353.; Paris, 1 t. 10 c., £365.

POTASSIUM MURIATE

Channel Islands (F.), 12 t., £240.

POTASSIUM PERMANGANATE

Calcutta, 4 c., £85.

POTASSIUM PROTOXIDE

Galatz, 1 kg., £21.

POTASSIUM PRUSSATE

Mauritius, 1 c., £12.

POTASSIUM SULPHOCALCATE

Calcutta (F.), 1 cs. (pt.), £10.

POTASSIUM TARTRATE

Hong Kong, 5 pkgs. (pt.), £69.

PYRO ACID

Durban, 1 cs. (pt.), £6.; Melbourne (F.), 1 cs. (pt.), £45.

QUININE

Bombay, 8,094 ozs.; Buenos Ayres, 960 ozs.; Calcutta, 2,282 ozs.; Montreal, 47,000 ozs.; New York, 15,000 ozs.

ROSIN

Mauritius, 18 c.

SALAMONIA

Durban, 5 c., £16.; Teneriffe, 1 c., £5.

SALICYLIC ACID

Aalborg (F.), 1 cs., £10.; Bangkok, 1 cs., £14.; Hong Kong, 1 cs. (pt.), £14.; Trinidad, 1 cs., £7.

SALT

Antwerp, 145 t.; Bombay, 2 t. 11 c.; Cairns, 2 c.; Casablanca, 26 t.; Dunedin, 5 t.; Gothenburg, 1 t.; Madras, 2 t.; Trinidad, 3c.

SALTPETRE

Bilbao, 18 t., £1,091.; Bombay, 3 c., £13.; Calcutta, 1 c., £6.; Durban, 1 t., £64.; Lagos, 2 c., £7.; Monte Video, 8 c., £22.; Montreal, 1 t., £52.; Paranagua, 1 c., £14.; Pt. Elizabeth, 12 c., £37.; Rio de Janeiro, 1 t. 10 c., £87.; Valencia, 1 t. 10 c., £80.

SHEEP DIP—

Bluff, 2 t., £113.; Buenos Ayres, 56 t. 4 c., £3,300.; Dunedin, 2 t. 5 c., £125.

SILVER NITRATE—

Calcutta, 1 cs. (pt.), £21.; Piraeus, 3 cs. (pt.), £20.; Rostoff-on-Don, £309.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London."

"Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

CURRENT TOPICS

THE CONSERVATION OF OIL.

IT is a long time since a scientific and technical institution has listened to such a paper as that read before the Institution of Petroleum Technologists on Tuesday by Rear-Admiral (Retired) Philip Dumas on "The Conservation of Oil." In the first place the Admiral made no pretensions to be scientific, and the one plea throughout the paper was that steps should be taken to eliminate waste in oil, the supplies of which were regarded as so precious as to warrant the most drastic steps being taken to limit its use. No mere reading of the printed paper, however, can ever do justice to the author's manner of delivery. It was, the President (Sir Frederick W. Black) said, as if a fresh breeze from the ocean had blown into the meeting room. Even that, however, by no means conveys the atmosphere which Admiral Dumas introduced. Perhaps we can best indicate to our readers what we mean when we say that Admiral Dumas is an out-and-out disciple of Lord Fisher. He attacked everything and everybody, from the oil producers to the oil users, for waste, with a perfectly well-intentioned manner. He constantly digressed from the printed text of his paper, and peppered his remarks with mildly lurid exclamations in order to drive home his arguments and give vent to his feelings and enthusiasm to such an extent that we are afraid that though he himself was perfectly serious in what he said and really imagined that the position is as bad as he painted it, he really developed in his audience that feeling of easy tolerance which obtrudes itself when listening to an irresponsible speaker. As a matter of fact, Sir John Cadman in the discussion hinted as much, for before he spoke we had such men as Sir Marcus Samuel, Admiral Sir Charles Goodwin, Sir Tennyson D'Eyncourt, and Sir Charles Greenway saying that all the bogies which Admiral Dumas had put up were really of his own creation and did not exist in fact. Whilst admitting the

good intentions of the Admiral and granting that, despite exaggerations, he did put a finger on some spots where oil waste goes on—moreover, nobody can deny that oil conservation is essential,—the paper provided a curious anomaly, in that whilst on the one hand it urged that coal should be used on all battleships during peace time and oil conserved in this way, yet he gave a most graphic and picturesque description of the horrors of coaling ships, and predicted that before long we shall find stokers refusing to do this filthy work. He spoke, too, as if the large oil companies had done nothing in the way of research, whereas Sir Charles Greenway reminded him that the staffs of chemists of British oil companies are at least as large as those of any German company. A typical sentence in the paper ran thus: "It is this factor [waste] which is the keynote of my lecture, for inquiry shows waste—waste all along the line, haphazard education, and waste of brains, wasteful research, wasteful boring, wasteful production, wasteful storage, wasteful use of main and by-products, wasteful transport, wasteful retail sale, waste in the lack of concentrated chemical research into its constituents, and, lastly, waste in its most economic use." In that one breathless sentence we have the gist of the paper, which did nothing to suggest—as indeed perhaps could hardly be expected—how this awful state of affairs was to be remedied. This whole string of problems was simply flung at the heads of the members of the Institution as problems which have to be tackled, and of course it is not to be denied that they exist, in degree. They always will, no matter what progress is made, but the Admiral utterly failed to stampede his audience into the belief that the state of affairs is quite so alarming as he suggested it was. Nevertheless, we must not condemn Admiral Dumas as an out-and-out irresponsible, for he was secretary of the Royal Commission on Oil Fuel and Engines, and as such is in possession of a vast amount of information collected by that body but not yet published. Therefore, some of his views are worthy of serious consideration. For instance, his plea for the institution of Chairs of Geology at all our universities is a sound one. Indeed, he begged of the oil millionaires to come forward and build a university for geological education alone. A paper such as this should have the effect of giving a stimulus if only for the fine monetary rewards promised or, rather, predicted in this and that direction. Certain it is that the Admiral's paper was in the true Fisher vein, for everybody remotely associated with the subject came in for a share of his condemnation. However, it was all good to listen to, and condemned as we ourselves are to attend so many scientific and technical meetings we only wish there were more authors after the style of Admiral Dumas. We are afraid, however, that true scientific progress demands there should not be. Probably one of the best points in the paper was the prophecy that eventually the distribution of oil throughout the country will be by pipe lines to the main centres, and so avoid the wasteful method—as far as time goes at any rate, and also oil to some extent—of distributing by means of large drums on lorries. Again, credit was given to those in the oil

industry for much good work, but the sly dig at the authorities that "we give a peerage to the caterer of the House of Commons and damn all who have done anything useful" seemed rather to be lost on the audience. On several occasions the Admiral referred to the necessity for putting the price of oil to its proper economic height. The point was not dealt with in the discussion, but apparently it is assumed that that is the way to check the use of oil. If so, the Admiral is welcome to his opinion, for the industry does not anticipate a shortage of oil, and to attempt to restrict its use by unduly inflating the price will only have the effect of seriously retarding progress in many engineering industries, and not the least of all in mechanical road transport, upon which the country will have to depend to an ever increasing extent in the near future. Here again the Admiral was inconsistent, for after telling us that there will not be enough oil to go round before long and that it ought to be treated as a luxury, he asks if anyone can doubt that there are vast fields of oil yet to be located.

EFFECTS OF NUCLEIC ACID DERIVATIVES ON PLANT GROWTH.

A PAPER by Professor W. B. Bottomley on "The Effect of Nitrogen-fixing Organisms and Nucleic Acid Derivatives on Plant Growth," was communicated by Professor F. W. Oliver, F.R.S., at a meeting of the Royal Society last week.

The products of the nitrogen-fixing organism, *Azotobacter chroococcum*, were shown to have a marked effect in increasing the rate of growth of plants of *Lemna minor* in water culture; and the derivatives of nucleic acid, which the author has found can be extracted from raw peat, are also able to act as accessory food substances. The addition of these two separate materials to the culture solution increased the number of plants from 1,817 in mineral solutions only, to 96,921 and 80,179 respectively in the liquids containing these substances. Not only was the rate of multiplication increased by these organic materials, but the plants supplied with them maintained their normal size and health, 100 plants from the two series containing these substances weighing respectively at the end of the experiment 18.6 and 18.7mg.; while 100 plants from the series growing in pure mineral nutrients weighed only 4.7mg. When both the nucleic acid derivatives and the *Azotobacter* products were added together to the culture solution, the number of plants obtained was 293,171, an effect practically identical with that of bacterised peat, for the series containing this latter extract showed 292,864 plants in the same time. The nitrogen-fixing organism, *Bacillus radiclecola*, is found to have a similar effect to that of *Azotobacter chroococcum*. A similar series of experiments was carried out with the ash of the crude nucleic acid derivatives and of the *Azotobacter* growth, and neither of these materials had the slightest effect on the rate of multiplication or the health of the *Lemna* plants.

It is therefore the organic material which is so essential for the complete metabolism of these plants, and they cannot maintain their normal growth and vigour for any length of time without the presence of small quantities of organic substances.

COST RECORDS OF ACID MANUFACTURE AND RECOVERY.*

(Concluded from page 532.)

THE entire secret of successful cost analysis depends upon dividing each manufacture into a number of separate processes, and showing clearly the efficiencies and costs of each of these processes. A number of the obvious processes are nitric-acid manufacture, sulphur-trioxide manufacture, denitration, etc. It must be noted that these processes are considered in detail apart from the explosive into the manufacture of which they enter. In analysing the cost of the finished explosive, the incidence of the cost of the subsidiary operations is shown after exact allowance has been made for the effect of changes in process stocks. The primary idea in a number of costing systems seems to be to allocate each item of expense directly against the finished product. For example, the cost of concentration is considered from the point of view of a debit against the manufacture of an explosive, rather than as a separate process, with the result that the effect of the costs and efficiencies of these important processes, upon which depends so closely the cost of the finished product, may be obscured and ignored.

The following are the headings of expenditure shown on typical cost sheets:—

1. *Materials Used*.—The figures are arranged so as to express the actual and 100 per cent. quantities and rates, and the sterling value of each material consumed.

2. *Process Wages*.—Under this heading are shown the following sub-headings:—

- (a) *Plant Officers*.—Salaries of all plant officers, including chemists, danger building officers, shift engineers, etc., whose whole time is spent on the plant concerned.
- (b) *Operative Wages*.—Wages of foremen and all process workers.
- (c) *Overtime Allowances*.—The excess wages earned by overtime rates, over and above the ordinary rates, the overtime wages at ordinary rates being shown as operative wages. Here also should be included holiday money.
- (d) *Yard and Traffic*.—The labour cost of handling raw materials and products into and out of the particular plant to which the process sheet applies

3. *Fuel, Water, Power, Etc.*—Under this heading are shown all fuel and other sources of power grouped into the following sub-headings:—

- (a) *Process Fuel*.—The quantities and sterling amounts of direct fuel consumed, separate headings being shown for coal, coke, gas, and oil.
- (b) *Water and Water Power*.
- (c) *Steam and Steam Power*.
- (d) *Electric Power and Light*.
- (e) *Compressed Air*.
- (f) *Refrigeration*.

Under each of these services is given the proportion of expenditure on such services allocated to the various processes, including engineers' salaries, where these can be directly allocated.

For each service it is desired to obtain the actual cost exclusive of factory general oncost. Expenditure, however, of a direct nature which, while not admitting of

specific allocation, refers generally to several of the above headings, is apportioned between and included in the expenditure under such heads. As such an item may be mentioned engineers' shop charges.

4. *Plant General Expenses*.—Under this heading are given all plant general expenses sub-divided into:—

- (a) *Plant Stores*.
- (b) *Clothing*.
- (c) *Shift House and Mess Room*.—This only applies where there are separate shift houses or mess rooms for each plant.

5. *Maintenance of Plant and Process Buildings*.—This is divided into:—

- (a) *Materials*.
- (b) *Wages*.
- (c) *Oncost (Shops and Salaries)*.—This item includes cost of repair shops, salaries of maintenance engineers, foremen, tradesmen, etc., but not any portion of the factory general oncost.

6. *Deduct By-products, Etc.*—This includes all by-products—e.g., nitre-cake, pyrites cinders, etc.—but not any credits of an extraordinary nature.

7. *Add Oncost (General Expenses)*.—This includes all office, management, police, welfare, medical, and main stores charges; accident pay; upkeep of general buildings (buildings other than process buildings); wages of yard and traffic gangs not occupied exclusively on particular plants; transport charges for workers; garage expenses and all overhead charges which cannot be otherwise directly allocated. No factory general oncost is allocated to other heads of expenditure on the process sheets.

The general oncost is allocated on the basis of operative wages (2 b only), exclusive of any other wages, however allocated.

8. *Adjust For*.—This heading allows for credits for sales of scrap, and for any other extraordinary charges or credits.

Factory oncost, it will be noticed, has been allocated on the basis of operative wages, and none of the ordinary service charges such as wages, water, steam, and power, maintenance, etc., carry any proportion of the factory oncost. It was thought that adopting this method of allocation would lead to greater economies at the factories, for the managers at the various sections could then see clearly the exact amounts that they themselves had spent directly on the various operations. Perhaps a more satisfactory allocation of the factory oncost referred to in heading 7 would have been on the basis of the total wages included in the process—i.e., the officers' and operatives' wages, overtime allowances, wages spent on maintenance, and also the corresponding proportion of the wages included in the amount spent on fuel, water, steam, and power.

The materials shown on the cost sheets as used and produced should agree exactly with the figures as given by the technical records. The only exception is in cases where it is necessary to allow for loss in handling, wastage, etc.—e.g., at a Grillo plant, experience has shown that it is necessary to add about 0.7 per cent. to the recorded usage of sulphur at the plant in order to reconcile the invoice weight of sulphur with the amount

*Abstracted from the Report on the Statistical Work of the Factories Branch, issued by the Ministry of Munitions (Department of Explosives Supply).

used at the plant. These adjustments are made in the cost sheets. The best procedure is to show this loss on the technical records as well, and later this was done, so that a typical nitric-acid report shows two efficiencies—

- (1) The plant efficiency, determined by the actual amount of nitrate delivered to the retorts;
- (2) The over-all efficiency, which takes into account a percentage added to the amount used at the retorts in order to cover the loss in handling, in bags, etc.

The values charged on the above sheet for the raw materials in the "raw materials used statement" require careful consideration. Occasionally, as in the manufacture of nitric acid, for example, where the raw materials are sodium nitrate and sulphuric acid, which may both be purchased from outside sources, no difficulty arises as to the costs at which they are to be charged to the plant. When the process, however, refers to waste-acid treatment, the starting point for the operation is waste acid, and various considerations govern the values at which this is to be charged to the plant. Similar questions must be discussed in connection with the nitration of substances, as to the costs of the fresh-mixed acids used, and the credit to be allowed for the waste acids produced.

In entering the acids in the costs, it has been found best to adopt the 100 per cent. H_2SO_4 and HNO_3 units, both on process sheets and in acid accounts. The one exception to this is on the oleum plant process accounts, in which the 100 per cent. SO_3 unit is used, but in transferring quantities from the oleum process to the acid accounts and to other processes, or *vice versa*, these quantities are shown both as SO_3 and H_2SO_4 , in order to avoid any possibility of misunderstanding.

It should be noticed that, as far as a system of accounts is concerned, when acids are produced they are at once transferred to an appropriate stock account. Thus the strong acid stock account would be drawn up somewhat as follows:—

	Tons.	Rate.	Amount.
		£	£ s. d.
Stock at beginning of period	6.7	42.116	282 3 7
Produced at retorts during period	1,174.1	43.561	51,145 11 0
Produced at stills during period	1,650.0	43.561	71,875 13 0
	2,830.8	—	123,303 7 7

	Tons.	Rate.	Amount.
		£	£ s. d.
Delivered to NG acid mixing	636.1	43.715	27,807 2 2
Transferred to NC acid mixing	2,136.0	43.715	93,374 17 0
Unaccounted for	10.0	—	—
In stock at end of period	48.7	43.561	2,121 8 5
	2,830.8	—	123,303 7 7

It is, perhaps, soundest if the material in stock at the end of the period is valued at the cost of manufacture or purchase, while the material delivered to the various sections is charged at a uniform rate necessary to make both sides of the account balance. The same method applies, of course, to the stock accounts, not only of acids, but also of raw materials and intermediates or finished products. Thus, in the above stock account, the stock at the beginning of the period is valued at the cost of production for the preceding month, whilst the productions at the retorts and stills are credited at the cost of production. The stock at the end of the period is valued at the cost of production for the period—namely, £43.561.,—while the issue price of nitric acid—namely, £43.715. per ton HNO_3 —is such that both sides of the account balance.

The discussion of acid values will be simplified if it is noticed that, in the sulphur trioxide plants at H.M. Factories, oleum or sulphuric acid of any strength can be produced at the same cost per ton of SO_3 content. Hence all the strong sulphuric acid produced at the factory, including that at the concentrators, is valued on its SO_3 content, according to the cost of production or purchase of sulphur trioxide for the month; the materials charged statement for the oleum process sheet will be somewhat as follows:—

	Tons H_2SO_4 .	Tons SO_3 .	Rate SO_3 .	Amount.
			£	£
Strong sulphuric acid	1,468	1,198	7.803	9,349
Less weak acid charged	235	191	7.112	1,364
Net acid charged	1,233	1,007	—	7,985
Production of oleum as SO_3 (1,476 tons) from 645 tons of sulphur at £12 10s. per ton	—	1,476	5.458	8,057
4.51 tons of sulphur at 0.7 per cent. handling loss	—	—	—	56
To this add plant expenses	—	—	—	3,875
Total cost	—	2,483	—	19,973

Thus the cost of producing oleum equivalent to 2,483 tons of sulphur trioxide—i.e., $1,007 + 1,476$ —is £19,973., and this gives the current cost of manufacture of sulphur trioxide—viz., £8.044. per ton of SO_3 (or £6.567. per ton of H_2SO_4).

The question arises as to the rates at which the strong sulphuric acid or weak sulphuric acid respectively are to be charged or credited to the plant. A simple method, not involving much work, and only very slight error, is to value them at the same rates as for the previous month, and this method has been adopted at the factories.

Having fixed the price of strong sulphuric acid from the cost of production and/or purchase for the current month, the value of the weak sulphuric acid is determined by subtracting from the value of the strong sulphuric acid resulting from its concentration the actual expense of concentration.

The raw materials statement for the concentration cost would be then:—

	Tons H_2SO_4 .	Rate	Amount
		£	£
Strong sulphuric acid produced	6,485	6.567	42,586.338
Less cost of concentration	—	—	3,555.896
Denitrated acid used	6,562	—	39,030.442

The total in this account then gives the value of the weak sulphuric acid—viz., $\frac{£39,030.4}{6,562}$ or £5.948. per ton

H_2SO_4 . It should be noted when referring to the cost sheet that in arriving at this figure no allowance has been made for the charge of £87. entered there, for this is an unusual item.

The nitric-acid raw materials statement is comparatively simple, as the raw materials are sodium nitrate, which is purchased, and strong sulphuric acid, which may also be purchased. If the strong sulphuric acid is not purchased, the method of finding its value is that given above.

Nitric acid is frequently made in two strengths, strong nitric acid and weak nitric acid. Its value in either case has been based on the same rate for the 100 per cent. HNO_3 content, when it has been possible for the factory to absorb all the weak nitric acid in acid mixing.

If the weak nitric acid is to be distilled, the cost of distillation and the cost of manufacture jointly determine the respective values of strong and of weak nitric acid.

The raw materials statement for the distillation process cost account would read:—

	Tons.	Rate.	Amount.]
Weak nitric acid			
Strong sulphuric acid			
Less weak sulphuric acid produced			
Expenses			
Strong nitric acid produced			

The account then gives one relation between the value of strong nitric acid and of weak nitric acid. The other relation is given by the nitric-acid manufacturing account, and the two combined give, by a simple calculation, the values of weak and strong nitric acid.

The weak sulphuric acid is valued at the current rate for weak sulphuric acid, so that the nitric acid has been made to bear, not only the actual expense of distillation, but also the loss on the depreciated sulphuric acid. This is only equitable since, in this distillation, the sulphuric acid is used only for the purpose of producing strong nitric acid.

In nitrocellulose manufacture spent acid is produced which must be distilled. In this case, as both the recovered sulphuric and nitric acids are of value, it seems logical to share the distillation expenses between the recovered acids in the ratio of their values. There will be no difficulty in doing this, since the recovered nitric acid has the current value of manufactured strong nitric acid, while the recovered sulphuric acid has the current value of weak sulphuric acid. This process also fixes the value of the nitrocellulose spent acid produced, on the basis of the values of the H_2SO_4 and of the HNO_3 contents of the waste acid.

Frequently, however, weak nitric acid, mixed with sulphuric acid for distillation, and the spent nitrocellulose acid, are distilled together. In this case the most logical procedure would be to consider the recovered acid as divided into two parts. One part is sulphuric acid which has been used solely for the sake of concentrating the weak nitric acid by distillation, and this should not carry any share of the distillation expenses. The other part is sulphuric acid recovered from the nitrocellulose spent acid, and this should, of course, bear its proper share of the distillation expenses. The first method, however—namely, that of making the nitric acid bear the entire cost of distillation,—has been used throughout at H.M. Explosives Factories. In dividing up the sulphuric acid into the two parts, it is assumed, of course, that the percentage loss on the sulphuric acid is the same for both the sulphuric acid added to the nitric acid and also for the sulphuric acid in the nitrocellulose spent acid.

In the denitration, however, of waste acids from MNT, TNT, picric acid, and nitroglycerine, the complication mentioned above does not arise, and the denitration expenses have always been divided between the nitric and sulphuric acids recovered in the ratio of their values. The value of the recovered nitric acid depends upon its future use. If it is re-used in the form of mixed acid for the same manufacture, its value is taken at the current value of nitric acid, reckoned, of course, on a 100 per cent. basis; if, however, it is necessary to distil it, its value is that of weak nitric acid determined as outlined above, and it has been customary to value it at this rate in cases when it has been transferred to another section—i.e., the nitrocellulose section. The value of the sulphuric acid is, of course, equal to that of the current weak sulphuric acid. Hence this method really fixes the values of nitroglycerine, mononitrotoluene, TNT, and picric acid waste acids.

THE OUTLOOK FOR THE CHEMICAL INDUSTRY.

THE first meeting for the session of the Liverpool Section of the Society of Chemical Industry took place on Monday evening in the Adelphi Hotel, Liverpool, Mr. A. T. Smith, J.P., presiding. The chairman, in introducing Dr. E. F. Armstrong, who was to address the Section, said that that was his last appearance in the chair, and it was his pleasing duty to introduce Dr. Armstrong as chairman of the Section for the next two years.

Dr. Armstrong paid a warm tribute to the retiring chairman for the valuable services he had rendered the Section during the past two years, and proposed that a hearty vote of thanks be accorded him for his services.

The vote of thanks was passed very cordially.

Dr. Armstrong then proceeded to address the meeting on the subject of "The Outlook for the British Chemical Industry." He first referred sympathetically to the passing away, since they last met, of one very great chemical industrialist, Sir John Brunner. What Sir John Brunner and Dr. Mond had done for the chemical industry in that district everyone knew, and he thought they ought not to let the occasion go by without mention of their names. Proceeding to his subject, Dr. Armstrong said that individuality, that marked British characteristic, had led, as in other trades, to the formation of sections buying from one another, and involving transport charges. The German chemical industry might be said to be better balanced than ours, and that was a prime factor in the German's success. They had primary articles and all their by-products within the one factory. They had a pooling of interests without sinking the individuality of the firms concerned. All, even the designers of plant, were in the pool, enabling it to manufacture so cheaply that no assistance was wanted in the form of import duties to keep competitors out of the market. The conditions pointed to large-scale industries as being necessary in industry in future.

Dr. Armstrong spoke next of the need for technical management. The successful manager must, he said, be a modern Admirable Crichton, able to get the best results out of the workpeople and be a master of detail. Unless something could be done to bring that type of man into industry in future, we should be severely handicapped in the competition with America. The position of the chemist in chemical industry was many-sided. He might have to be able to carry operations through from the laboratory to the large scale. Success depended on the co-ordination of many factors. In our works there had been too little of scientific control. In Germany, often in small factories, the man in charge was a trained chemist instead of a simple organiser. In consequence, most of the smallest German works were highly efficient technically. The British chemical industry must employ a far larger number of trained chemists in future if the position was to be maintained.

The popular idea that success was based on secrets was a fallacy. An ideal plant would not compensate for bad leadership. The right kind of man was in small supply in England. Standard types of plant had been out of the question owing to the difficulties of their operation in small works. All the processes of the industry required specialised engineering knowledge, and it was for us to see that all were trained. With regard to labour, higher wages, shorter hours, and less work, all tended to increase cost. Unless production per individual

were increased, higher wages could only mean higher prices. Probably, if pains were taken to give the worker a general understanding of a process, he would be in a position to earn higher wages with diminished repair bills and higher yields.

The possession of a modern, highly equipped plant was essential to cheap production. Unfortunately, the very large factories, like those at Gretna and other places, built by the State, were considered by commercial men to be totally unfit for commercial processes. Had they been conducted in connection with existing works they would have been of use to practical men, instead of which they were of no immediate value. None would question the great amount of successful work of those responsible for the production of explosives. It was only by having peace industries formed to be able to turn at once to war products that they would be of the greatest value, and be turned in future, if wanted, from peace to war. Then there was the question of transport. The war had left British transport in a state of chaos, and a serious increase of charges was inevitable.

The chemical industry was a technical industry. The outlook was best described as full of promise, but it needed the whole-hearted and intelligent co-operation of those engaged in it if it were to attain the high position to which it was entitled, but above all we must not look to protection. He did not want anyone to think he had overrated the Germans, but we must not make the mistake, because we had beaten the Germans, of underestimating what Germany had done in the chemical world. We did not want slavishly to copy, but we must study what had been done and apply the lessons to our own advantage.

The Chairman said it was of very great importance to them to look round and see what they had to face in the technical difficulties that were before them. He was practically certain that the problems of the next few years bristled with difficulties. We were short of everything we wanted. Whilst we had competition outside to face, we were faced by an enemy in our own camp—the unwillingness of labour to pull its weight. It came out of their own pockets after all, because the working-man was the largest consumer in this country. He therefore said to working-men: We can only make progress by sticking to it, but so long as the brake is on the wheels, and there is "ca' canny," we shall never succeed and only be left behind. He was much obliged to Dr. Armstrong for his paper, and had very much pleasure in moving that they pass a hearty vote of thanks to him for it.

Mr. T. W. Stuart seconded. Alluding to the references made to the labour problem, they all recognised, he said, that they should all do their utmost. The question of labour was about the most serious problem anyone who had to control large works had to face.

Mr. John Gray said he wished to join with the others who had expressed their views in his own appreciation of Dr. Armstrong's opening address. He was sure they were to be congratulated on the choice of their chairman for the coming session.

Mr. Arthur Carey expressed his agreement with the whole of Dr. Armstrong's address. Speaking of transport, he said that in this country it was in a very bad way, and he thought they might be faced with a complete breakdown at any moment. The explanation of the railway companies was that the Government had taken the wagons. He thought they put the figure at 10,000, and there had been no construction during the

war, and very little repairs. How far that was a cause, and how far it was an effect of the conditions that were affecting their factories, the position of labour that was unwilling to take its coat off and pull all it was worth, they were not in a position at the moment to say, but he knew the effects were most serious.

The vote of thanks was passed unanimously.

THE MANUFACTURE OF NITRATE OF LIME IN NORWAY.

By G. A. Cowie, M.A., B.Sc., A.I.C.

WHILE the principle of the process used in Norway for the production of nitrates from atmospheric nitrogen is generally understood, it would be difficult without actual inspection to form anything like an adequate conception of the magnitude of the industry. A total of 300,000 to 350,000 H.P., rendered available from waterfalls, is now in use in the synthetic manufacture of nitrates. The first factory was established at Notodden in 1905, but Rjukan, where works were also opened in 1911, and considerably extended after the commencement of the war, is now the chief centre of the industry. A few practical details about the manufacture of nitrate of lime at the latter place may serve to convey some idea of the nature and proportions of the enterprise.

Rjukan 1, as it is called, to distinguish it from the newer works there, is in reality the largest water-power station in the world (140,000 H.P.). The current from there is conducted to the furnace-house through 60 cables of a length of three miles each. By means of blowers 1,000 million gallons of air are at Rjukan driven through the electric furnaces every 24 hours. The heat in the furnaces, exceeding 3,000° C., brings about a combustion of the nitrogen of the air resulting in the formation of nitric oxide (NO). These hot gases (800° C.) are used as fuel in large steam boilers, where the temperature is reduced approximately to 250° C. By water-coolers the heat of the gases is further reduced to about 50° C.

The subsequent retention of the gases for some time in large oxidation tanks results in the transformation of nitric oxide (NO) to nitrogen dioxide (NO₂). The gases are next conveyed through three granite towers, 23 metres high, and filled with quartz sprinkled with water. This operation causes the absorption of the nitrogen dioxide by the water with the production of weak nitric acid (30 per cent.). This acid is then passed over limestone, and a solution of nitrate of lime is thus obtained.

The weak solution of nitrate of lime is next concentrated by evaporation until it contains 13.1 per cent. nitrogen. The liquid nitrate being now thick is passed over revolving cylinders, which are internally cooled; the nitrate is here rapidly solidified and is taken off in leaves. The leaves of nitrate are then granulated in small mills. From high silos the nitrate in the finished state is filled into barrels of 100 kilos net weight. At Rjukan alone the normal daily production is 2,000 barrels.

It may be of further interest to mention that Rjukan, where the barrels themselves are made, possesses actual facilities for making 5,500 and packing even 6,122 barrels daily. What this means may be illustrated by the fact that the staves required for this number of barrels would, if placed end to end, extend over 80 miles, and the iron for the hoops over 20 miles. By working at full pressure it is possible with the existing facilities to fill a cask every one-sixth of a second.

PRODUCTION OF ARTIFICIAL ABRASIVES.

MR. C. J. BROCKBANK (Thorold, Ontario) read a paper on "The Production of Artificial Abrasives in the Electric Furnace" at a meeting of the Birmingham and Midland Section of the Society of Chemical Industry held on Thursday (November 13) at the University of Birmingham. Members of the Birmingham Metallurgical Society also attended. Mr. L. P. Wilson (chairman) presided.

Artificial abrasives require for their production, said Mr. Brockbank, large quantities of electrical energy, such as can be furnished cheaply by the enormous water-power developments of Canada, the United States, and similar countries abroad. Due to this natural advantage, there have developed in Canada several plants of large size devoted entirely to the manufacture of artificial grinding materials called by various trade names, but consisting of two groups, one silicon carbide, and the other aluminous abrasive, or artificial corundum. The refractory by-products produced are also of great importance, and have contributed very materially to increased efficiency in the operation of many types of furnaces. The first artificial abrasive was discovered by Dr. Acheson, in 1890, while endeavouring to crystallise carbon by dissolving in melted silicate of alumina fused by a small electric arc in an iron pot. His ignorance of chemistry led to one of the most remarkable discoveries in the electro-metallurgical field, and formed the foundation of what is to-day one of the most important industries in the world. Dr. Acheson, conceiving that the blue crystals resulting from his experiments must be a combination of carbon and alumina, and ignorant of their real chemical composition, named the material carborundum.

Silicon carbide is not a universal abrasive, in that it cannot be used on all classes of grinding. It is suitable and highly efficient in the grinding of brittle materials such as cast iron, marble, mother-of-pearl, etc., and the finishing of leather. The physical properties of silicon carbide render it unsuitable for producing the fine, smooth finish required in steel grinding. It is intensely hard (the next hardest material to the diamond), and very brittle. During grinding the edges of the individual grains are constantly fracturing, exposing fresh cutting edges, which score deeply into a tough material such as steel. The discovery that aluminous ores such as bauxite and emery could be electrically smelted with coke, and commercially pure, crystallised artificial corundum obtained therefrom, completed the requirements of the abrasive field, and rapidly forced natural emery into the background, except for a few restricted operations such as glass polishing.

Silicon carbide is formed by the reaction at high temperatures of silicon and carbon. In practice it is found necessary to add varying amounts of sawdust and sodium chloride; the former is to maintain porosity, so that the large volumes of carbon monoxide may escape without causing blowholes at local spots in the furnace; the salt is used to assist in the elimination of the impurities present in the coke and sand as chloride. A typical furnace mixture when all new materials are used is: Petroleum coke, 1,500lb.; white sand, 2,520lb.; sawdust 300lb. (180 c.f.), and salt 40lb. A considerable proportion of the mixture used in a furnace is not converted into silicon carbide, acting merely as a heat-insulating blanket, and this material will ordinarily be returned to the mixing department. Petroleum coke is the carbon residue left in the stills when distilling crude oils. It is the only form

of carbon that can be used satisfactorily for producing the highest grade of silicon carbide. This does not appear to be due altogether to its purity, since good silicon carbide cannot be made from lamp-black, but is in some way due to the readiness with which this form of carbon is converted into graphite by the agency of heat. Charcoal is readily changed to graphite, and similarly will make excellent silicon carbide. Silicon carbide furnaces are built in sizes varying from 1,000H.P. capacity to 3,000H.P. capacity. A furnace of less than 1,000H.P. size cannot be operated economically. A 3,000H.P. furnace will produce approximately 7 per cent. more silicon carbide per unit of power input than a 1,000H.P. furnace, although the advantage is somewhat offset by the fact that the quality from the largest size is not so good. A 1,000H.P. electric furnace is 20ft. long between the heads carrying the electrodes, and 5 or 6ft. wide inside. The heads carrying the electrodes are 40in. thick, and two electrodes are used for each terminal, made from graphite, 10in. diameter and 48in. long. The method of loading the furnace is as follows: The furnace is charged with mixture slightly above the level of the electrodes, and a trench formed in this mixture 36in. wide and 10in. deep, which is filled with about 1,200lb. of graphite powder. This forms the resistor core, and conducts the current from one terminal to the other. The mixture is then piled on this core and the furnace is ready to operate. There is considerable shrinkage during the run, the level gradually falling below the side walls of the furnace. The side walls must not be removed till at least 24 hours after a furnace has been disconnected, otherwise the product is liable to be injured by oxidation. Subsidiary reactions involving to some degree recrystallisation of the product take place after the furnace is disconnected.

Regarding the finishing of the silicon carbide, Mr. Brockbank explained that the crystalline silicon carbide after removal from the furnace is crushed in a pan mill and treated successfully with a sulphuric-acid and caustic-soda bath. This removes the surface impurities from the grain, consisting of graphite, silicon, silicides of iron, and silicide of aluminium. It is then washed and dried in a rotary dryer, and passed over screens which separate the grains into various sizes from $\frac{1}{16}$ in. mesh to $\frac{1}{32}$ in.; finer sizes are graded by hydrostatic methods. This material forms the pure product used by the wheel manufacturer for making abrasive wheels.

Regarding aluminous abrasives or artificial corundum, these are manufactured by smelting a mixture of bauxite and coke in an arc furnace; the impurities, mainly silica and iron oxide, are reduced and settle to the bottom of the furnace, and the fused alumina is recovered in the form of a large pig or ingot weighing four to five tons. A typical furnace mixture is calcined bauxite 1,750lb., coke 100lb., iron borings 350lb. The furnace is started by placing a layer of mixture in the furnace about 1ft. deep, and laying a train of graphite powder from one electrode to the other on the top of this. As soon as a small path of molten ore is formed this carries the current, and more mixture is charged into the furnace as required. These furnaces operate at about 100 volts, and require 550kw. Reduction must not be carried too far, otherwise the abrasive will be too pure and brittle. The presence of one or two per cent. of iron oxide, silica, and titanium dioxide increases the toughness of the product. The metallic residue recovered will contain from 10 per cent. to 15 per cent. of silicon. Sufficient iron borings are added to the mixture to keep the silicon content of the alloy below 15 per cent.; otherwise the material would

be too weakly magnetic to be separated from the crushed corundum. Power is a comparatively small proportion of the total manufacturing cost of artificial corundum, and it would therefore appear to be quite practicable that aluminous abrasive should be manufactured in England at a cost that would compete with the foreign product.

The paper was well illustrated, and was followed by a discussion, chiefly of inquiry.

THE EFFICIENCY OF SHEEP DIPS.

THEIR EFFECT ON WOOL.

AT a meeting of the Leeds University Textile Association last week, Dr. Sidney Williamson, of the Cooper Research Institute, delivered a lecture on "The Effects of Sheep Dips on Wool," and referred in turn to a number of compounds used as sheep dips, including nicotine preparations, cresylic acid, arsenic, and alkaline sulphides.

The lecturer confessed that it was impossible to say what the effects of these varieties upon wool were, for the reason that such investigation as had been carried out was largely of a biased character. Practically they had only the evidence of the proprietary sheep dip manufacturers, who were making a living out of the article which they sold, and, on the other hand, of the respective Governments whose object it was to give the farmers as cheap a dip as possible without running the risk of killing the sheep. The whole discussion as to the effects of dips on wool had unfortunately centred mostly in the lime and sulphur dip, the one which the farmer himself made for the sake of cheapness. Naturally, that dip was opposed by the manufacturers of proprietary dips. In spite of much research for authentic evidence as to the injurious effects of dip upon wool, the lecturer said he had come across nothing which could be regarded as conclusive. In regard to the proprietary dips, he thought they could leave it to the manufacturers in their own interests to ensure that their dips were non-injurious.

Regarding the lime and sulphur dips, if they could have the dip made perfectly and used under perfect conditions, there would be no injury to the wool. But the danger was that when the lime and sulphur dip was made carelessly, and used without proper regard to the conditions, the effect might be to render the wool harsh, and so as not to dye properly. All the evidence was clear, however, that there was no injury from the lime and sulphur dip if properly prepared. The Sheep Dipping Committee, which reported to the British Government in 1904 upon the dips then on the market, came to the conclusion that they produced no injury whatever to the wool. He was not convinced that that conclusion was quite correct. What he had found from personal observation was that all dips would injure the wool to a greater or lesser extent if they were wrongly prepared. There had been used in the past a certain oil in dips, which had such an effect upon the wool that when scoured it turned pink. Nowadays no manufacturer ever used that particular oil.

On the general question of the effect of dips upon wool, Dr. Williamson gave it as his opinion that nicotine in dip was not injurious so long as pure nicotine was used. Carbolic acids, as a rule, were only injurious if they contained an excess of alkali, which tended to disintegrate the fibres. If a farmer used impure tar oil in dipping he might get wool which, after scouring,

would turn almost brick-red in colour, but such instances were rare. Arsenical dips were not injurious unless an excess of alkali had been used in making the arsenic soluble. On the whole, he was inclined to believe that the arsenical dip improved the wool, but it was an exceedingly difficult thing to prove. The Australian farmer believed that the dip gave him a heavier and better clip. The lecturer would not like to assert that that was so, although, he said, he was able to bring other evidence in support of that conclusion. He had had a great deal of experience of dipping cattle in South Africa, and after dipping in an arsenical bath, cattle had a better coat. If that was the effect observed upon cattle, he did not see why it should not obtain in regard to sheep, and if such dipping improved the skin of the sheep, he thought it followed that it must improve the wool. On the other hand, if the arsenical dip was too strong, it would undoubtedly injure the wool. That was the whole position with regard to all dips, and the greatest danger so far as he could see was that farmers might be crude in their preparation of the lime and sulphur dip. It would be found that the wool from countries which used the lime and sulphur dip did not stand so high in the market values as the wool from those countries where cresylic or arsenical dips were used.

AUSTRALIAN IMPORT RESTRICTIONS.

THE High Commissioner for Australia has received advice from the Prime Minister to the effect that a Proclamation, dated November 1, 1919, has been issued prohibiting the importation of the undermentioned goods except by licence. The conditions upon which the Minister for Trade and Customs will issue a licence will be published later.

Absolute alcohol; amylic alcohol; collodion; sulphuric ether; anæsthetic ethers; ethyl acetate; antimony, star, antimonial and lead compounds—viz., type and linotype metal, antifriction, and plastic metals; copper—viz., angles and tees, bars and rods, pipes and tubes, plate sheet and strip, wire; phosphor copper—bars, rods, and ingots; zinc and spelter—bar and ingot; oils, coal-tar, viz., benzol, naphtha (solvent), naphtha (heavy); paints and colours—viz., dry white lead, kalsomine water paints and distempers in powder form, white lead in oil, paint ground in liquid in packages weighing over 14lb., plaster of Paris; carbolic acids; cresylic acid; crude creosote and crude tar oils; naphthalene, crude; naphthalene N.E.I.; arsenate of calcium; arsenate of lead; arsenite of soda; arsenite of zinc; carbolic disinfectants; sodium hyposulphite; arsenic; arsenate of soda; arsenic sulphide; ethyl chloride; sodium sulphate (Glauber's salts).

The Board of Trade understand from a cable they have received from their Senior Trade Commissioner in Australia that goods in the course of shipment or on *bona fide* order, except those previously specially prohibited, will not be refused entry.

A Proclamation dated August 20 revokes the Proclamation of August 14, 1918, by which the importation into the Commonwealth of caustic soda, soda ash, soda sulphide, white lead, and red lead was prohibited.

PERSONAL.—Dr. R. H. Pickard, F.R.S., principal of Blackburn Municipal Technical School, has accepted the position of principal of Battersea Polytechnic, London, at a salary of £1,250. During the war he has done a great deal of valuable research work for Government departments in connection with anæsthetics and explosives.

MONOAZO DYESTUFFS FOR LAKES AND PIGMENTS.

A PAPER on "Monoazo Dyestuffs suitable for the production of Lake and Pigment Colours" was read at a meeting of the Oil and Colour Chemists' Association on November 13 by Mr. W. A. Allsebrook. In introducing the paper, the author said he was not an authority on dyes, or even dyestuffs. Neither was he engaged in the manufacture of intermediate products or lake dyestuffs. The subject was his hobby, and his object was to encourage the lake maker to produce goods of pre-war quality, as he believed he had a better chance than chemists engaged in large dye concerns, who knew little or nothing as regards the use the particular dyestuffs might be put to.

The first part of the paper enumerated the monoazo dyestuffs common to the textile and colour industries, all of which, with the exception of the developed colours, are soluble in water. Soluble monoazo dyestuffs were divided into two chief classes—viz., amidoazo and oxyazo compounds. The number of the former is limited, and they are basic in character with the exception of their sulphonic acids. Aniline yellow was the first monoazo dyestuff to be discovered, and was used for dyeing wool from 1861—1863. It is, however, very fugitive to light, but treated with fuming sulphuric acid produces yellows which are the most stable towards light of any of the yellow acid dyes. The simplest monoazo dyestuffs are greenish-yellow to yellow, but as the molecular weight increases the colour changes to orange, violet, and blue in succession. The preparation of lake and pigment colours for basic dyestuffs was of considerable interest, as methods similar to those employed in the dyeing of textile fibres were employed. Certain natural bases, such as green earth and china clay, had the property of attracting and fixing basic dyestuffs in the same manner as the animal fibres, wool, and silk, and colours struck on green earth were not only faster to light, but had the property of resisting the action of lime. The preparation of lakes, however, depended on three factors—viz., the dye itself, the precipitating agent, and the base on which the lakes were struck, the inert base serving the purpose of either increasing the body of the lake, as well as of modifying or toning down the shade. At the same time it reduced the cost. The first acid dyestuffs were produced in 1877 by Griess and Witten in England and Roussin in France under the names of Orange I. and Orange II., in which α and β naphthol were used for the first time. Orange II. is largely used in connection with wall-paper staining, but is not used to any great extent as a pigment colour. From 1877 the number and variety of monoazo dyes rapidly increased, the sulphonic acids of various amines were diazotised and coupled with numerous isomeric sulphonic acids of the naphthols and naphthylamines.

PIGMENT LAKE DYESTUFFS.

Of far greater importance to the colour manufacturer, however, are the pigment lake dyestuffs introduced about 1900 by the German aniline colour manufacturers, specially for the manufacture of pigment colours. They are, said Mr. Allsebrook, sold under a variety of fancy names, which tell nothing as to what they are made from or how they are made, coming on the market generally in the form of 20 per cent. pastes, requiring either only to be ground with suitable bases or mixed

with water to a thin consistency with the base, and developed sometimes by boiling with certain metallic salts such as barium, lead, magnesium, or calcium, usually the chlorides, which give variation of colour to the lakes so treated. The application of the new pigment lake dyestuffs was soon recognised, with the result that a constantly increasing number were produced which not only superseded the old lakes made from natural dyestuffs, but in many cases had proved cheap and efficient substitutes for many natural pigments. How essential this class of colouring matter was to the so-called aniline colour manufacturers in this country was fully realised towards the end of 1914, and it was no secret now that one English colour house alone was buying over 100 tons of lythol red paste per annum. It was true that to-day English-manufactured lythol red R. was on the market, but it was not in sufficient quantities to meet the demand. Lake red was also on the market, but of greater interest to lake makers was the fact that its intermediate product, of English manufacture, was now for sale. The intermediate products required could be produced by the large dye concerns in this country, and if members of the association interested in the production of pigment lake dyestuffs collectively demanded a certain intermediate, they would stand some chance of getting the product at a reasonable cost, and thus be enabled to produce the finished dyestuff at a competitive price.

CHROME COLOURS.

Although the lead chromes hold the field on account of their excellent covering power and brilliancy, certain monoazo yellows, such as Hansa yellows, have the advantage of not becoming discoloured by the action of sulphuretted hydrogen, resisting the action of lime, and are not poisonous. They are as fast to light, and although more expensive than the lead chromes, have considerably greater staining power. How soon such yellows would be able to compete in price with the lead chromes the author did not care to forecast, but he pointed to the fact that pre-war monoazo oranges had been able not only to compete with the oranges produced from basic lead chromate in price, but had the advantage of withstanding heavy grinding, and gradually taking the place of orange chromes in the floorcloth and linoleum industries. Zinc chromes might have certain advantages over lead chrome as regards resisting the action of lime and sulphuretted hydrogen, but they found only a limited use when lake yellows were obtainable, which possessed six times their strength, and when mixed with blues gave more brilliant greens. Genuine vermilion had been completely replaced by the fast reds, which not only could compete in price, but excelled in fastness and staining power, and were also compatible with lead compounds. Given highly manufactured intermediate products the author is satisfied that colour chemists will produce pigment lake dyestuffs in quantity to meet the full demands of this country.

Finally, he hinted to the lake dyestuffs manufacturers that they must suitably reward those who worked diligently for them in assisting to protect the chemical industries, the key to which was cheap intermediate products.

DISCUSSION.

The Chairman (Mr. W. J. Palmer) said the paper was a comprehensive review of the mono-azo pigment dyestuffs. It had taken them right through from the early stages of azo-dye manufacture to the simpler soluble dyes more par-

ticularly of interest to textile dyers, and then gradually brought them down to the present day more complex mono-azo dyes, including those of an insoluble nature which were of more interest to the members of the Association as pigment manufacturers and pigment users.

Mr. A. Molteno said the preparation of beta naphthylamine sulphonic acid was a matter he had been trying to find out for a long time, but had not been successful. The important point in connection with lakes and so on was fastness to light, and he would like to know whether the dyestuffs of the mono-azo group varied in fastness according to the number of the nitrogen atoms.

Miss F. M. Merrick asked for the working proportions of a lythol red using alcohol or methylated spirit, and wished to know whether there was any recovery of the alcohol used. It seemed to her rather an expensive form of manufacture.

Mr. E. S. Haynes said there was one point upon which he would like enlightenment. In the use of lythol red, particularly the yellow shades, he had noticed repeatedly that British-made dyes were extremely solvent in water. That was not the case with German dyes, and it was giving trouble in the printing-ink trade owing to the fact that some of the colours were used in lithographic work, where the material came into contact with water. He presumed it had something to do with the purity of the preparation. That was a point to which British manufacturers should give attention.

The Chairman emphasised the point that pigment manufacturers in this country should aim more at obtaining their own intermediate products and producing from them their own dyes. It would allow of more scope for individuality in obtaining colours, and probably lead to better results. The main point was to obtain a pure intermediate, but up to the present he was afraid that that had been one of the great difficulties. He did not agree with the author that certain of the reds mentioned in the paper were much superior to, say, vermilion. It might be so in many cases, but the fastness was not so reliable as in tints and reddish shades using zinc, lithopone, or white lead as were often required in paint and enamel manufacture. Whilst Hansa yellows and similar products might replace lead and zinc chromes in many cases, he thought that the question of body, from the point of view of the paint and enamel user, was an important consideration. Hansa and similar yellows always had a certain amount of body, but they wanted bolstering up with some base having considerable body; and not only was the dyestuff itself expensive, but when taken into account with the point he had mentioned it resulted in an expensive product, and he was afraid it would be long before it would be a serious competitor with zinc and lead chromes.

Mr. Tyson asked if the author had had any experience of the manufacture of certain cheap colours by the pan mill process, and if he considered that the development of such colours as lake red B and lythol red in a pan mill would have the effect of deteriorating the colour, and also whether the same effect could be obtained as when using a vat.

Mr. O. Wilkins thought it would be interesting if he stated that the British Dyes Corporation was now larger than any one of the individual firms in Germany as they existed before the war. Seeing that they had only had a few years in which to get into that position, he thought it spoke very much for the results which had been obtained. He had seen samples of lythol red which were quite equal to the German pre-war stuff, and he believed it would be on the market in quantities in a few weeks' time. He was certain that there was a great future for the aniline dye industry in this country, and during a recent visit to the works of the British Dyes Corporation he had been surprised at the extension and development which had taken place. Dr. Levinstein had assured him that there was not a dye product in the whole of the German pre-war selection which they could not make when they had had sufficient time to collect the plant together. He believed that the solution of the dye industry in this country, however, was not for it to be concentrated in one or two large corporations, but for the gas companies and other people to carry their crude products to the intermediate stage, and allow colour-makers in this country to be the real colour-makers, and not mere grinders in pan mills. At Huddersfield a few years ago they brought out a lake red B, but it was rubbish. It had been put right since, but if the colour-makers had been able to obtain suitable intermediates there would not have been the delay that there had been. Instead of there being only one man at work producing colours, as there was when the work was concentrated in one large corporation, there would be many men scattered

over the various colour-makers' works, and he felt very strongly that that was one of the solutions from the colour-maker's point of view.

The author, replying to the discussion, said that the fastness of many of the mono-azo dyestuffs was fairly good, and many of the later ones, such as the oranges, were absolutely fast to light. A paper which would deal with this subject more fully, however, was to be read later in the session. Answering Miss Merrick, he said that one of the Badische specifications dealt with the manufacture of lythol red, using alcohol. He himself, however, had had no experience. With regard to the purity of dyestuffs, mentioned by Mr. Haynes, he believed the trouble was in coupling the sodium salt. He had never been able to make a lythol red R equal to the German product according to the original German specification, but he had been able to do it by dissolving beta-naphthol in caustic soda and throwing it into a fine state of division with phosphoric acid. He believed the pan mill development of lythol red, mentioned by Mr. Tyson, was on the right lines. Lythol red R could be made more brilliant by concentrated solutions than by weak solutions. He agreed with all that Mr. Wilkins had said with regard to intermediate products. With regard to the chairman's remarks on the body of dyestuffs, he believed these dyestuffs would be produced with a good body. The German dye people had set themselves out to do this business right, and they had done it right in many ways. Even zinc and lead chromes were not all they should be sometimes. Just as the war began the Bayer Company had some products which had a very good body indeed.

A hearty vote of thanks was accorded the author at the conclusion of the paper.

ROYAL COLLEGE OF SCIENCE CHEMICAL SOCIETY.

AT the Royal College of Science, South Kensington, on Friday (November 14), Professor F. G. Donnan opened the Session of the College Chemical Society, with an address on "The Nitrate Industry of Chili." Professor Donnan, who is head of the Chemistry Department at University College, has recently returned from Chili, where he has been recuperating after a serious breakdown in health. Although ordered there for a "complete rest," he spent his time in making an exhaustive examination of the nitrate industry. In his lecture he spoke of the mining and manufacturing processes in some detail, and concluded with a short discussion of the relative merits of several theories which have been advanced to account for the formation of the nitrate beds. The lecture was illustrated with about thirty lantern slides, and various specimens of the deposits constituting the beds.

The society is this year commencing what promises to be one of the most successful sessions in its history. During the latter part of the war it was almost non-existent, but, in the hands of a competent committee, it bids fair to make up for lost time. Most of the papers are read by the students themselves. The society also aims at making its members acquainted with technical processes, by arranging visits to factories; quite a number of such excursions have already been arranged.

EXPORTS TO AMERICA.—The American Chamber of Commerce in London is opening an information section through which it hopes to assist British manufacturers to sell their goods in America. The ultimate object is a British-American reciprocal information service, but in view of the present rate of exchange it is proposed for the time to confine the work to ascertaining the market for British goods in America. For the present, too, it is proposed to deal only with proprietary and trade-marked articles. British manufacturers of proprietary or trade-marked goods who have supplies of their goods for export are invited to ask the American Chamber of Commerce for information about the present and prospective demand for them in America.

ALSATIAN POTASH DEPOSITS.

THE potash deposits of Alsace have been investigated by Mr. F. K. Cameron, of the Minerals Investigation Department of the United States Bureau of Mines, and are the subject of a recent report. The physical and chemical characteristics of the Alsatian deposits, it is said, are quite different from those of Stassfurt, in Germany. At an average depth of about 1,800 feet lies the lower layer or bed, practically (though not strictly so, because of faulting) a continuous stratum of a mixture of potassium and sodium chlorides of an area known to be upwards of 77 square miles and of an average thickness approximating 11.5 feet. This layer is not far from horizontal throughout its extent, with a dense, compact roof and floor of dry clay, so that mining difficulties are of minimum importance. About 20 feet above lies the parallel but less extensive upper bed about 4 feet thick. The lower bed is now being worked, the less important upper bed being exploited in a few places only, and being regarded as a reserve for future operations. The cubic contents of the two layers is estimated to be upwards of 1,350,000,000 cubic yards, containing approximately 1,500,000,000 tons of salt or (a rough approximation) 275,000,000 tons of potash (K_2O), enough to supply the world's probable demands for two centuries.

POTASH CONTENT.

The average potash content of the Alsatian salt mixture is certainly 18 per cent. K_2O , and possibly three or four per cent. higher, while the average for the salt as mined in Stassfurt is probably about 12 per cent. K_2O . In both regions individual samples may show wide variations, but the average for the run-of-mine is astonishing, even for the Alsatian product. Since the soluble salts in the Alsatian product are potassium and sodium chlorides alone (other salts being entirely absent or present in very small and negligible quantities), the preparation of pure potassium chloride is effected very easily and cheaply by a simple fractional crystallisation, whereas the presence of sulphates, or more especially magnesium salts, in the Stassfurt salts makes the preparation of a pure grade of potassium chloride a matter of appreciable expense and involves more or less complex technology. On the other hand, there is no production of the commercially desirable high-grade potassium sulphate in Alsace.

FRENCH MINES.

There are in Alsace nine potash mines, each with two shafts. Two of these mines, with their four shafts, belong to a French company, the Sainte-Therese, with a main office at Mulhouse, although the ownership is mainly at Nancy. Production had just begun when the war opened. All four of these shafts were flooded during the latter period of the war. Very little damage was done by the flooding, which seems to have occurred through carelessness and not by any malicious intent of the Germans. It is believed the shafts can soon be brought into operation (one has been pumped out), and it is worthy of note that because of the physical characteristics of the deposits in Alsace, the flooding of a mine does not involve necessarily its permanent abandonment, as appears to be the case at Stassfurt. These French mines being the latest in the field, their equipment is on the whole better in character and more complete than at the other mines. For instance, they are provided with magnetic separators to remove iron fragments from the crushed ore and prevent damage to machinery, and the details of arrangement are better

worked out. Refineries have been designed for these mines, but little in the way of reconstruction upon them has yet been done.

GERMAN-OWNED MINES.

The other shafts, 14 in number, were all owned by German companies before the war, but are now in the control of the Sequesterar, an official whose function is that of a Custodian of Alien Property. Seven shafts are being operated by French army engineers, and others will be gradually brought into shape for operations. The oldest mine in the region comprises shafts Amelie I. and II., near Wittelsheim. In 1913, Amelie was the third or fourth largest producer under the Kali Syndikat, largely because of the very high grade of its product, for which there was a special demand. There is a large plant at Amelie for the recovery of high-grade salt, which was more or less damaged during the war, mainly by neglect, and possibly to some extent by malice. It is now being put into shape and is producing. The Reichsland, situated just west of Wittenheim, is at present in better shape both in mine equipment and refinery, and is producing more than any other mine, about 800 tons of raw salt and 80 tons of refined salt daily. It has a private switch connection to the main line at Reichwiller, and a railroad warehouse. It is noteworthy in having a steam plant with the highest chimney in Upper Alsace, and generates its own power, whereas the other mines all purchase their power from the Oberrheinische Kraftwerke at Rheinfelden, although several of them have steam plants and generators which they hold in reserve. The mine Theodore, near Wittenheim, with the shafts Theodore and Prinz Eugen, is connected by switch to the main line at Reichwiller. The mine is in rather bad condition, as the Germans proceeded to gut it and take out as much as possible of the best salt in the last few months of their tenure, disregarding timbering and like precautions. The refinery at this mine is of very special interest, since the French army engineers in charge of operations are using the plant for large-sized experiments to determine the best practice. The results should be of the greatest importance for the future of the industry. Although commercial production is not at this time the first consideration at Theodore, nevertheless it stands next and near to Reichsland in this regard.

COST OF PRODUCTION.

From notes of rough estimates on the ground, the following figures are submitted by Mr. Cameron as fair approximations of the present actual cost of putting Alsace potash at Havre, Antwerp, or Rotterdam:—

1.—For potassium chloride averaging 18 per cent. K_2O or better:

Operation.	Cost per Ton.
Mining.....	4.00
Milling.....	0.85
Bagging.....	1.50
Renewals and repairs.....	1.00
Office and supervision.....	0.75
Interest.....	1.00
Freight.....	2.00
Total.....	11.10

Cost per unit of K_2O 0.617

2.—For potassium chloride averaging 45 per cent. K_2O or better.

Operation	Cost per Ton.
Mining.....	10.00
Milling.....	4.12
Bagging.....	1.50
Renewals and repairs.....	4.50
Office and supervision.....	1.88
Interest, etc.....	3.75
Freight.....	3.00 (1)
Total.....	28.75

Cost per unit K_2O 0.639

To these figures must be added a charge for amortisation, profit, taxes, and ocean freight. On the other hand, Mr. Cameron states that it is reasonable to expect some of the above figures to be modified downward with further experience and development of trained and ample working forces. The present freight rate on crude salts from the mine is 20 francs to Havre, 18 francs to Antwerp, and 16 francs to Rotterdam, but there is good prospect for early and substantial reductions, especially in the rate to Havre. In April of this year the production of the Alsatian mines had reached about 2,500 tons of raw salts daily. There was on hand ready for immediate shipment to any purchaser about 150,000 tons of kainit, averaging at least 18 per cent. potash, K_2O , and 400 to 500 tons of concentrated salts, averaging probably 50 per cent. potash, K_2O .

FUTURE POSSIBILITIES.

One thoroughly equipped shaft of a potash mine is supposed to be competent for bringing to the surface at least 800 tons daily, and if both shafts be fully equipped twice this production could be realised. In other words, if all the existing shafts in the Alsatian field were put into maximum producing condition the field should produce about 15,000 tons daily of crude salt. Such a production would correspond in round numbers to one million tons of actual potash annually, about the pre-war demand for all the world, including Germany.

SCIENCE AND KEY INDUSTRIES EXHIBITION AT GLASGOW.

CHEMICAL EXHIBITS.

GREAT interest is centring upon the British Science and Key Industries Exhibition which was opened on Monday afternoon in the Kelvin Hall of Industries at Glasgow, and it is anticipated that this will be visited by many experts from all parts of the kingdom during its fortnight's run. The Kelvin Hall of Industries is now the largest building of its kind in the kingdom, and the result is that the promoters—the Glasgow Corporation—have been able to allocate space to a great many firms who in a smaller building would not have had the opportunity of showing their specialities. A number of the stands are concerned with the chemical and allied industries, and these are sure to attract great attention from visitors.

Messrs. John W. Leitch and Co. (Milnsbridge Chemical Works, near Huddersfield) have an interesting show devoted to benzole, toluol, xylol, solvent naphtha, and Glauber salts. Messrs. Brunner, Mond and Co., Ltd., (Northwich), are showing ammonium nitrate produced from nitric acid made by the catalytic oxidation of ammonia; while they are also showing synthetic phenol produced by the sulphonation of benzene and subsequent caustic-soda fusion of the sodium benzene sulphonate, with treatment of the resulting sodium phenate by carbonic acid. Messrs. The Gas Light and Coke Company (London) have an exhibit comprising products of coal-tar distillation and of coal-gas purification, and these are displayed as marketed. Some of the applications of these products are also admirably illustrated. Messrs. R. Graesser, Ltd. (Ruabon), are showing phenol from coal tar, and other chemicals in which they specialise. This is an exhibit of great variety, and shows to advantage the different specialities of this firm. Messrs. The Koppers Coke-Oven and By-Product Company (Sheffield)

show a series of photographs illustrating, among other things, tar stills at the Cadishead Works of the British Tar Products, Ltd. (erected by this company); the firm's patent system of recovering tar and ammonia direct from coke-oven gas; and also their system of recovering benzole from coal gas.

Messrs. W. J. Bush and Co., Ltd. (London), have an exhibit consisting mainly of fine organic chemicals prepared synthetically. This firm claim to be well equipped to meet German competition, and a special point is made of the purity of all their manufactures. Messrs. The British Drug Houses, Ltd. (London), show fine pharmaceutical chemicals, as well as specimens of dyes in dry form and in solution. Messrs. Thermit, Ltd. (London), show their speciality and all its compounds in an interesting manner. This exhibit is divided into three main sections: Pure carbon, free metals, and alloys; Thermit compounds for various purposes, with explanation of their uses; and the Thermit process of welding. Mr. J. Arthur Greene (London), in collaboration with the technical advisors of the Committee on the Production of Oil and Coal, etc., shows an exhibit of raw materials, crude oils, and refined products, embracing fifty samples of carbonaceous material from various deposits in Great Britain, and also including samples of lignite from Devonshire, and shales from Scotland and Dorset. Messrs. The Lennox Foundry Company, Ltd. (London), show photographs of chemical plant for the production of drugs, dyes, and heavy chemicals.

Messrs. The United Alkali Co., Ltd. (Liverpool), have a very important selection of chemicals on exhibit. They are showing, among other varieties, aluminium chloride, benzoic acid (sublimed and technical), caustic potash, copper sulphate, magnesium chloride, nitric acid (pure), salammniac, soda crystals, etc. Messrs. Brotherton and Co., Ltd. (Leeds), show metachrome colours for the production of the large range of fast shades on wool; acid chroming colours; acid colours suitable for dyeing wool, silk, jute, paper, and leather; colours for lake-making; and other specialities, such as zinc formosul, liquid ammonia (all strengths), benzole, etc. Messrs. The British Dyestuffs Corporation, Ltd. (Manchester and Huddersfield), have an exhibit primarily designed to illustrate the manifold application of coal-tar dyes, and thereby to indicate the extent to which an industrial country is dependent upon the colour industry. Special sections of this exhibit are also devoted to synthetic indigo and its derivatives, and also to duranthrene and durindone dyes (vat dyestuffs), and other colours of exceptional fastness.

Messrs. The British Oil and Cake Mills, Ltd. (London, Glasgow, etc.), illustrate in their exhibit seed crushing (oils expressed from linseed, cottonseed, rapeseed, etc.); oil extracting (oils extracted from rapeseed, palm kernels, soya beans, etc.); and other of their specialities. Messrs. The South Metropolitan Gas Company (London) have an exhibit comprising examples of chemical preparations representative of the firm's manufactures in various branches of the chemical industry, and also illustrating the extensions made in these branches during the war. The products are divided into two groups—those which were being manufactured before the war, and are still being manufactured; and products which have been manufactured since the war.

Such, in brief, are the specialities being shown by the various firms connected with the chemical and allied trades who have either stands or show-cases at this important Glasgow exhibition.

SELECTIVE ADSORPTION AND FROTHING REAGENTS.*

By H. L. SULMAN.

OF two solutes in the same solvent, that which is the more strongly adsorbed (lowers surface-tension more) tends to displace the other from the surface-layer. Professor C. V. Boys found that a trace of soap added to a saponine solution destroys the characteristic properties of the latter; the attraction of the water molecules for saponine molecules is apparently less than for those of soap, which therefore is selectively adsorbed: in support of this, we find the surface-tension of soap solution to be less than that of saponine. Fragments of gold-leaf, powdered metals, graphite, and metallic sulphides floating by tension effect at a water-surface are immediately sunk by the addition of sufficient saponine or soap. Because of its pronounced adsorption at a water/solid interface, soap is selectively adsorbed at and consequently detaches oil and grease from surfaces already oiled. Selective adsorption thus accounts for the detergent properties of soap; it is intimately concerned with the phenomena of dyeing and other technical industries.

A glass surface exposed to the air becomes contaminated with a minute grease-film; when moisture condenses on such a surface it does not form a continuous water-film, but a congeries of minute hemispherical droplets: hence preparations of soap, saponine, or ox-gall, which displace the grease-layer and lower σ (surface tension) for water, prevent the "dimming" of eye-glasses and cause raindrops on the wind-screen of a car to coalesce into a film. Saponine excludes the minute globules of an oil-emulsion from a water surface; they are observed to form a layer at a minute yet visible distance beneath it.

Facts relating to the adsorption of certain gases from gaseous mixtures by porous solids are beyond our immediate province, but similar selective reactions occur in many instances.

Many types of selective adsorption are concerned in the production of a mineralised froth, as for example those occurring—

- (a) between the various solutes at an air/water interface;
- (b) " solute and mineral slimes at such interfaces;
- (c) " immiscible oil and water/mineral interfaces;
- (d) " immiscible oil and solute at the oil/water interface;
- (e) " acid and alkali solutes and certain sols, and gangue/water interfaces

—to mention only the more readily appreciable reactions. A host of similar adsorptions happen contemporaneously in regard to differential flocculation, and, as they arise from the interaction of the same molecular forces, the overlapping effects of flocculation and adsorption cannot be sharply differentiated from each other.

In arriving at a stable froth-equilibrium in any given case, from so complex a system of interfaces whose possible molecular reactions are very great, a not inconsiderable time-factor is demanded. It will also be appreciated that, as such an equilibrium may depend upon a somewhat narrow balance of many contributive causes, a comparatively small increase or decrease in the range of but one factor may produce a quite different equilibrium.

An adsorption of mineral particles does not alone confer sufficient elasticity upon a water-film, yet a stable and extensive bubble-film area must be provided to

contain the mineral; this is secured by the addition to the water of a substance whose particles or molecules are adsorbed to an extent sufficient to yield an elastic and conformable film, yet not so strongly adsorbed as to displace the mineral from the film, a *joint* adsorption being required. An elastic film of but partially reduced energy can adsorb mineral particles, which now confer increased stability.

Soap, saponine, and tannic acid being readily soluble (or yielding high aqueous concentrations), and substances, moreover, which are strongly adsorbed at an air/water interface, their employment requires careful quantification; otherwise ore-suspensions shaken with solutions which so greatly reduce the surface-energy of water may yield barren, or "air-water" froths, all the mineral remaining sunken; while many other less strongly adsorbed substances permit the formation of well-mineralised froths.

Thus, amyl alcohol in low concentration in an ore-pulp—e.g., from 1 part in 5,000 to 1 in 20,000, or from $\frac{1}{2}$ to 2 lb. in a pulp consisting of 1 ton of ore and 4 tons of water—has been extensively used as a frothing agent, though later superseded by cresol in like or slightly larger proportions. The water-soluble portion of several fixed and many essential oils answers the same purpose. Since a minute amount of an insoluble oil adsorbed at the mineral surfaces will decrease their adhesion for water, a single oil may act both as a frothing agent and in enhancing the flotability of metal sulphides.

If an oil, alone, be used, it must be such as will yield a sufficiency of aqueous solute; eucalyptus, pine-oils, turpentine, the terpenes and their hydroxy-compounds, camphor-oils, and a host of other compounds and derivatives both aliphatic and aromatic, conform to this requirement. Thus many distillation products containing phenyloid bodies (phenols, cresols, creosotes, etc.), such as furnace-oils, wood-tar-oils, and the lighter tars, are widely used. Very dilute solutions of ethyl alcohol, and acetic acid, will produce mineralised froths, and the almost insoluble oleic acid of commerce yields a solute capable of producing a weak one; the latter instances are less of practical than of theoretical interest.

The constitution of an oil-solute is often very complex; eucalyptus-amygdalina solute contains aromatic alcohols (eucalyptol and geraniol), several aldehydes, ketones, oxidised terpenes, etc.; various samples of this oil when suspended in water, in the proportions used in practice, have shown the amount of the soluble fraction to vary between 6 per cent. and 9 per cent. of the oil; all the dissolved substances proved to be more or less useful as adsorptions. The insoluble portion contained the terpenes phellandrene and pinene (mainly the former), camphors (stearoptenes), and resinous bodies. Analytical scrutiny of either solute or immiscible portion, though of interest, is not essential, and may be misleading; the quicker and more reliable method is a small-scale trial of the oil in question with the particular ore it is desired to treat.

Sulphonated derivatives of oils ("soluble oils") have been employed with more or less success. These are of two types; those dissociated on contact with water into an immiscible oily-product and free acid, which thus give rise to the effects due to both dissociation products; and those not so hydrolysed, which function mainly as frothing agents.

It follows that choice of oils for both purposes, and even in regard to certain of their more specific applica-

* Extract from paper entitled "Contribution to the Study of flotation," read at a meeting of the Institution of Mining and Metallurgy in London on Thursday.

tions for particular minerals, is very varied. In some cases where the more usual oils have been difficult to obtain, local shrubs have been distilled, whose oily products have answered so well as thereafter to be widely recommended as specifics. Suitable mixtures are many: vegetable with mineral oils; mineral-oils with cresol, wood-tar, etc. Patent and other literature on the subject is already voluminous. Thus considerable business in "flotation oils" has developed, with a nomenclature sometimes fanciful. The oils recommended are doubtless useful and efficient, but ore-constitution and the nature of the mineral occurrence vary so greatly that none can claim to provide an infallible specific; an oil-mixture which answers admirably for a particular ore is by no means certain to yield identical results upon apparently similar ores elsewhere.

Summarising the foregoing paragraphs, a satisfactory froth-forming solute must provide an adsorption which, in nature and concentration, will show a balance of advantage in the directions of:—

- (1) Production of a large bubble-surface; and
- (2) Leaving the bubble-film with sufficient mineral-adsorptive energy.

This definition rejects oils which if used alone do not yield a solute, and solutes that do not froth with water; it coincides with a comparatively small reduction of σ for water. The mineral adsorptions which also take place at the film-surfaces further reduce the tension, and by their mutual adhesions again increase film-stability.

Nevertheless, in the absence of any traces of immiscible oil, cresol, amyl alcohol, and other true solutes do not yield very dense or coherent mineralised froths, although these for a while may be voluminous. The further stabilisation of a mineralised froth is secured by the adsorption of a minute film of immiscible oil at the interfaces of the mineral particles and the liquid.

PARLIAMENTARY NEWS.

Fertilisers and Feeding Stuffs.

In the House of Commons, Mr. Sith asked the Parliamentary Secretary to the Board of Agriculture whether his attention has been drawn to the last report issued by the chemical department of his board, wherein certain feeding stuffs, fertilisers, and other materials required in agriculture have been proved on analysis by Dr. J. A. Voelcker to be more or less valueless for the purpose they are advertised and sold to serve, and that in one instance alone the cost was more than four times what the material was worth?

Sir A. Boscawen: There is no report issued by the Board of Agriculture of the kind referred to by the hon. member. The results of analyses made by Dr. Voelcker of certain feeding stuffs and fertilisers are published annually in the *Journal of the Royal Agricultural Society of England*. Protection against fraudulent sales of fertilisers and feeding stuffs is provided by the Fertilisers and Feeding Stuffs Act of 1906. Under this Act, sellers are required to give a description of these materials where necessary, indicating their agricultural value. A false description to the prejudice of the purchaser constitutes an offence under the Act. The Board are now considering to what extent the Act should be amended with a view to giving greater protection to the farmer. The Board have repeatedly warned users of manures against the purchase of inferior or worthless articles at excessive prices, and have published a leaflet on the subject. Prices of fertilisers are not controlled by law; prices and distribution of feeding stuffs continue for the present under the administration of the Food Controller.

Restrictive Duties on Vegetable Oils.

Lieut.-Commander Kenworthy asked whether the present restrictive duties on the export of raw materials for vegetable oils will be applied to the mandatory areas granted to this

country under the covenant of the League of Nations; if so, whether this House will be given an opportunity of discussing this departure from the historic policy of Great Britain of recognising the rights of native races to sell their produce in the open markets of the world; whether the League of Nations aspect of this question has been fully considered; and whether an appeal by dissatisfied producers in these mandatory areas to the Council of the League of Nations will be permitted by His Majesty's Government?

The Under-Secretary of State for the Colonies (Lieut. Colonel Amery): The hon. member is incorrect in his assumption that there are restrictive duties on the export of the raw material for vegetable oils generally, but I presume he is referring to the special case of palm kernels exported from the West African Colonies, on which product there is a differential export duty of £2 a ton on kernels exported outside the Empire. In any case, the answer to the first part of his question is in the negative; the rest consequently does not arise.

Restrictions on Lithopone Imports.

Mr. Wallace, on Monday, asked what restrictions are at present imposed on the importation of lithopone, and for what reason the restrictions are continued?

Sir A. Geddes: The importation of lithopone is prohibited except under licence. As a general rule licences are granted to firms who imported it during the three months preceding September 1, allowing them to import it now at the same rate as during that period. Licences for importation of further quantities, however, are granted if producers in this country are unable to supply the demand. The restriction is intended to shield this "unstable key industry" from excessive foreign competition.

Mr. Wallace: Why are these licenses so difficult to obtain? Is the right hon. gentleman aware that one important firm's business has been almost brought to a standstill on account of the lack of this raw material, and how can manufacturers who are asked to increase our export trade do so under restrictions which make this impossible for want of raw material?

Sir A. Geddes: I was not aware that there was any difficulty with regard to getting licences, but if the hon. gentleman will bring any cases of that kind to my notice I will look into them.

German Dyes.

Major McKenzie Wood asked the President of the Board of Trade whether he is aware that German dyes are moving freely into France, Belgium, Holland, and the United States, and that British dye-users are losing trade to foreign competitors through being compelled to import their dyes through the Government Department?

Sir A. Geddes: The export of dyes from the occupied territory of Germany, in which the German dye-making works are chiefly situated, is allowed only under licence from the Inter Allied Rhineland Commission. The importation of German dyes into France and the United States is permitted only under licence. As regards importation into this country I would refer the hon. member to the announcement which appeared in the Press on November 13 as to the steps which are being taken to safeguard the interests of consumers.

Carbonisation of Coal.

Mr. Atkey asked the Parliamentary Secretary to the Ministry of Munitions whether he is aware that the Director of Steel Production compiled statistics showing the amount of coal carbonised both in patent by-product ovens and in bee-hive ovens in the years 1917 and 1918; and whether he would now publish these figures for each method of carbonisation?

Mr. Hope: The only figures available are those for the production of metallurgical coke for the years 1916, 1917, and 1918; these will afford some indication of the amount of coal carbonised in coke ovens during those years. The figures are as follows: 1916, 13,422,195 tons; 1917, 13,801,607 tons; 1918, 13,277,007 tons. The subdivision between by-product bee-hive, and retort ovens can only be given for the year 1917 and is as follows: By-product, 10,866,673 tons; bee-hive, 2,411,244 tons; retort, 523,690 tons.

ELECTRO BLEACH AND BY-PRODUCTS, LTD.—An interim dividend on the ordinary shares in respect of the half-year ended June 30, of 7½d. per share (less income-tax), being at the rate of 12½ per cent. per annum.

BRITISH ASSOCIATION OF CHEMISTS.

"If we don't hang together we shall assuredly all hang separately."
—JOHN HANCOCK, when signing the Declaration of Independence.

Hon. Registrar: DR. FRANCIS W. KAY,
Chemical Department, The University,
Liverpool.

NOTICES.

NOTICES and reports from secretaries of local Sections and articles and correspondence for these pages should be sent to the Hon. Editor, Dr. E. H. Rodd, 7, Mauldeth Road West, Withington, Manchester, and not to the *Chemical Trade Journal and Chemical Engineer*.

The Hon. Editor will be glad to receive short articles on the views of members with respect to the B.A.C., its aims and aspirations, for publication in these pages. Such articles should be accompanied by the name and address of the writer, not necessarily for publication.

Applications for membership of the B.A.C. should be sent to the Registrar, Dr. F. W. Kay, not to the Hon. Editor.

PROCEEDINGS OF THE ASSOCIATION.**THE COUNCIL.**

A meeting of the Council was held on November 15 in the Victoria Hotel, Manchester, at 1.30 p.m., the proceedings being necessarily brief on account of the annual general meeting following at 3 o'clock.

Treasurer.—Dr. E. P. Hedley announced that, to his great regret, he was compelled through unavoidable circumstances to resign from the post of treasurer. This intimation was received with expressions of the deepest regret by the Council. As successor to Dr. Hedley, it was resolved to recommend to the annual general meeting Mr. A. G. C. Paterson for election. A Finance Committee of three was elected, consisting of the treasurer, Mr. W. E. Kay, and Dr. F. W. Kay.

Association Offices.—The President announced that he had secured a room, admirably suited to be the offices of the Association, in Bedford House, York Place, London, W. 1. He had also purchased a typewriter, a duplicator, and other essentials. A vote of approval was carried unanimously, and the president was authorised to purchase other necessary articles of furniture.

Nominations Committee.—The election of a number of candidates approved by the Nominations Committee was confirmed, and a gentleman of Italian nationality was, according to the regulations, declared elected by a special resolution. In this connection, Dr. Walpole emphasised the desirability of electing as many allied chemists resident in this country as possible as a safeguard against a possible influx into this country at a later date of chemists of enemy origin prepared to work for small salaries.

Federation of Scientific and Technical Workers.—The payment of an entrance fee of £10. to this Federation was approved.

The remainder of the limited time at the disposal of the Council was devoted to making the necessary arrangements for the annual meeting which followed.

ANNUAL GENERAL MEETING.

The annual general meeting of the Association was held at the Victoria Hotel, Manchester, on Saturday last, Professor J. W. Hinchley, the president, occupying the chair. In his address, the Chairman said that during the past year the British Association of Chemists had passed through a great experience, and had come through it with increased strength, absolutely united, and full of energy for the coming year. An enormous amount of work was entailed in running the Association, and it was impossible for any man who earned his living by the practice of chemistry to do it. The Association had only been carried to its present position by the self-sacrifice of the men who had done the pioneering work. They had been compelled to appoint a paid official, and he (the speaker) hoped that, as time went on, still further assistance would be necessary. Describing the manner in which the work of the Association was carried on, the President said that most of the work was done in the local sections. The work of the Council consisted mainly in securing unity by hearing the opinions of the delegates from the local sections. They had thus achieved a degree of unity which was incomprehensible in societies that were ruled by an elected council.

Things were thoroughly discussed in the sections before going to the Council, and, as a rule, the agreement was very remarkable. They were all united in getting business done, and in getting it done in the best way. With regard to registration, the draft rules were actually in print, and were in the hands of the local sections. When these had been thoroughly discussed, the Council would be ready to proceed with the registration of the Association.

It was better for me to be certain that the rules would work than to register hastily for the sake of saying that they were registered. They had taken their time, and not a single member of the Council regretted the time that had been spent in bringing about unanimity. There was not a member of the Association who was not thoroughly qualified and competent, and that was a very desirable position to be in. They were getting a number of head chemists into the Association, and they intended to make full use of them to help the Association to secure the high standard of comfort necessary for the members of the profession. Through the Labour Party, certain questions had been raised in Parliament, and he hoped that eventually some return would be obtained for those chemists who had been so badly treated during the war. The Parliamentary work would be continued. He regarded it as extremely likely that before long members of Parliament of all parties would be tumbling over each other to do the Association's business in the House of Commons. In conclusion, he would like to say that the membership of the Association was increasing, but not so rapidly as it should. He hoped that the Council would have the full support of each member in their efforts to make the Association a real force in the country and in securing adequate remuneration for the chemist.

The Hon. Treasurer (Dr. E. P. Hedley), in presenting his report, said that the excess of income over expenditure for the year was £381., and, after deducting the deficiency of £40. on account of the preceding year, there was a balance of £341. He drew attention to the deposit account which had been started to form the nucleus of a Legal Aid Fund for the benefit of members. The Council proposed to invite from all the sections specimens of agreements made between different firms and the chemists employed by them, and to obtain legal opinion as to their value. It would probably be found that most of these agreements were worth nothing at all. The speaker pointed out that what chemists needed more than dollars was unanimity, and this they must have if they were going to make the B.A.C. worth anything. Class feeling amongst chemists, of which there was too much, must be eradicated. The Guarantee Fund which had been inaugurated had been very successful, and, with the amount already promised, they were in a position to go on with their programme. He emphasised the need for every member to endeavour to bring into the Association those chemists who were not already members. Unless they had every chemist inside they would not fully attain their ends. The financial report was adopted unanimously. The President stated that it had been impossible yet to send acknowledgments to those members who had promised to contribute to the Guarantee Fund, but these would be sent out in a few days.

Referring to the work of the Nominations Committee, Dr. F. W. Kay said that, for unavoidable reasons, the work of the Committee had been handicapped, but it was now hoped that applications for membership would be dealt with more expeditiously. Increase in membership must depend largely upon personal canvassing, and he urged them to use their influence in bringing in as many members as they could.

Dealing with the work of the Whitley Council's Committee, Mr. W. E. Kay said that early in the history of their attempts to find fields of activity for the Association, it was felt by the Council that the opportunities presented by the Whitley scheme should not be lost sight of, and a committee was formed to follow up this line of action. The first step of the Committee was to try to get the interest of chemists focussed upon the subject. To this end they had a very interesting lecture from Mr. Samuel Todd, of the Ministry of Labour. The Committee felt that it was not sufficient to interest chemists only, and at the close of the meeting a resolution was passed instructing them to get into touch with other organisations. Eventually, at a meeting in London, a Federation of Scientific and Technical Organisations was formed. That body, on which seven societies were represented, was now in the embryo stage of its existence, and he hoped that when it was in running order it would be of invaluable assistance to technical men. In formulating schemes for the work of professional men upon Whitley

Councils, the Committee had submitted right through that the councils should consist of three classes of men. Up to now the Whitley Councils only recognised the manual workers and the masters. The Committee wanted brain workers to have an independent existence on these councils. The Federation had been formed mainly for Whitley Council work, and at the start would work through its constituent societies in the same way as the B.A.C. works through its sections. They hoped that something very useful would come out of it.

The Chairman announced that the treasurer, for business reasons, was compelled to relinquish his post, and a resolution regretfully accepting his resignation was adopted. The following officers of the Association were elected: President, Professor Hinchley; vice-president, Mr. W. E. Kay; hon. registrar, Dr. F. W. Kay; hon. secretary, Mr. S. E. Price; hon. treasurer, Mr. A. G. C. Paterson; hon. editor, Dr. E. H. Rodd.

The Chairman, replying to a number of questions, said that a committee in London was sitting upon the question of income-tax payable by chemists, and a report would be issued shortly. It was hoped that chemists would be able to deduct from their incomes charges for the cost of books, subscriptions to learned societies, and the like. Regarding the formation of an Employment Bureau, the work would go forward rapidly now that a paid assistant secretary had been appointed. As regards salaries, it was neither possible nor desirable to fix a standard rate for chemists, but they had already expressed the pious opinion that no chemist should work for less than £350. per annum. If the lower-paid men all attained the minimum, then the higher-paid men would get still more.

ANNUAL DINNER.

Following the annual general meeting, a highly successful dinner was held in the Victoria Hotel, some sixty members attending the function. The informal nature of the proceedings was so much to the taste of the company that a general desire was expressed that the dinner should be made an annual event. In all probability, both meeting and dinner will next year be held in London. After the loyal toast had been honoured, several musical members of the company contributed songs, and a surprisingly large number shone in the rôle of *raconteur*. More serious in character were the speeches of Mr. Tutton (of Huddersfield) and Mr. Redgrove (of Liverpool), who spoke of the progress of the B.A.C. in their respective districts, and indicated the path of future progress. The feature of the evening was, perhaps, Dr. Walpole's address, in which he gave a vivid picture, from personal knowledge, of the state of occupied Germany at the present time. One little anecdote of Dr. Walpole's is worth recording. Surprised at seeing a bed of roses planted in close proximity to a sulphuric-acid plant, he inquired the reason. "Because," was the reply, "if those roses die, we know that somebody is wasting sulphuric acid." In Dr. Walpole's opinion, German chemists will not stay in their own country if they can possibly get out of it. We must be prepared for an invasion, and the B.A.C. must see that they are prevented from coming to this country and cutting out our own chemists with cheap labour.

COMING MEETINGS.

Liverpool Section.—Secretary, Dr. F. W. Kay, The Chemical Department, The University, Liverpool. A meeting will be held on Thursday, December 4, at the "Coffee Pot," Renshaw Street, at 7 p.m.

Huddersfield Section.—Secretary, Mr. H. R. Tutton, 1, Wentworth Street, Huddersfield. A smoking concert will be held on Friday, December 5, at the Queen Hotel, at 8 p.m.

Leeds and Bradford Section.—Secretary, Mr. H. Jennison, 8, Selborne Villas, Manningham, Bradford. A special meeting, which will be addressed by Professor Hinchley, Dr. Forster, Dr. Hedley, and Mr. Schofield, will be held on Tuesday, November 25.

HOLTON HEATH CORDITE EXPLOSION.—Early on Saturday morning an explosion occurred at the Royal Naval Cordite Factory, Holton Heath, near Poole, as the result of which a workman, Jesse Orchard, of Poole, was killed. He was engaged on an acetone recovery stove in the cordite section when it suddenly ignited. Orchard was terribly mutilated, and was killed instantaneously. The flames were visible for miles around.

NEW COMPANIES.

Savalot (1919), Ltd.—Private company. Capital £2,500., £1. shares. Object: To take over the business of soap manufacturers carried on by G. F. Cripps at 59, Ingrave Street, Battersea, as "Savalot and Co." Registered office: 59, Ingrave Street, Battersea, S.W.

Thermal Industrial and Chemical (T.I.C.) Research Company, Ltd.—Private company. Capital £7,500., £1. shares. Objects: To acquire and turn to account certain inventions of J. S. Morgan, and to secure his services as technical director of the company, to carry on researches, investigations, and experiments relating to the distillation, fractionation, deposition, or treatment of solid, liquid, or gaseous matter, etc. Solicitors: Holmes, Sons and Pott, Capel House, New Broad Street, E.C.

Nonporo Cement Company, Ltd.—Private company. Capital £15,000., £1. shares. Registered office: 80, High Street, Belfast.

Scientific Colour Company, Ltd.—Private company. Capital £10,000., £1. shares. Object: To adopt an agreement with K. B. Benham. Manufacturers of and dealers in potters' colours and materials, oil for belt-dressing, to prevent slipping, etc. Secretary: Miss M. Stapleton, Gaol Square Motor Garage, Stafford.

Greenwell and Irwell Rubber Company, Ltd.—Capital £800,000., in 400,000 ordinary and 400,000 7½ per cent. cumulative preference shares, all of £1. each. Object: To acquire the businesses of I. Frankenburg and Sons, Ltd., and the Irwell and Eastern Rubber Company, Ltd. Registered office: Greengate Rubber Works, Salford.

Maidenhead Rubber Plantations, Ltd.—Capital £25,000., 2s. shares. Object: To acquire certain estates in the F.M.S., or any interest therein, and to enter into an agreement with a company of the same name (incorporated in the F.M.S. and now in liquidation). Office: 30, Mincing Lane, E.C.

Excelsior Products Company, Ltd.—Private company. Capital £100., £1. shares. Object: To take over the business of Sir James Hacking and J. L. Cumpstey, carried on by them as the "Excelsior Products Company," at Barton Street, Blackburn. Dealers in indigo, manufacturers, importers and exporters of edible fats, etc. Office: Barton Street, Blackburn.

Fachwen Barytes Mines Company, Ltd.—Private company. Capital £10,000., £1. shares. Object: To take over the business of a quarry proprietor carried on at Fachwen, near Newtown, Montgomery, by F. J. Somerville. Registered office: 2, King Street, Liverpool.

Jay, Metliss and Son, Ltd.—Private company. Capital £2,500., £1. shares. Manufacturers and sellers of balata cement, etc. Registered office: 192, Ball's Pond Road, Islington, N. 1.

K. L. Allan and Co., Ltd.—Private company. Capital £10,000., £10. shares (400 preference). Export and import merchants, chemical brokers, oil refiners and blenders, etc. Registered office: 42, Stanley Street, Liverpool.

Lowestoft Fish Products Company, Ltd.—Private company. Capital £10,000., £1. shares (8,000 A. and 2,000 B.). Manufacturers of and dealers in fish meal and fish oil, etc. Registered office: 91, Queen Victoria Street, E.C.

Rhadley Mines, Ltd.—Private company. Capital £4,000., £1. shares. Object: To acquire leases of the Rhadley Mining Sett Cefn y Guntly Mining Sett in More. Salop, from C. McNeal and W. P. Jones, for the purpose of mining and treating sulphate of barium, carbonate of barium, lead, zinc, calcite, or other minerals, etc. Registered office: Lloyds Bank Chambers, Fenton, Staffs.

Rochdale Cake and Corn Mill Company, Ltd.—Private company. Capital £5,000., £1. shares. Object: To take over the business of cattle food cake manufacturers, corn millers, and manufacturers of and dealers in all kinds of fertilising compounds, etc., carried on by H. Kirk and R. M. Robinson at the Borough Mills, Rochdale. Registered office: Borough Mills, Rochdale.

Alex. Robertson and Sons, Ltd.—Private company. Capital £78,600., £1. shares. Wholesale and retail manufacturing chemists. Registered office: 26, Stafford Street, Oban.

Snow White Lead Company, Ltd.—Private company. Capital £5,250., in 5,000 preferred ordinary shares of £1. each and 5,000 deferred ordinary shares of 1s. each. Manufacturers of and dealers in mineral distillates of definite composition, and dealers in metals and metal products of all kinds, etc. Registered office: 149, St. Vincent Street, Glasgow.

LEGAL INTELLIGENCE.

Koppers' Coke-ovens and By-products: Ownership of Patents.

An action to determine the ownership of certain English patents standing in the name of Heinrich Koppers, a German, was heard by Mr. Justice Russell in the Chancery Division on Monday. The action was brought by Mr. Albert Victor Derry against Mr. Charles Rudolf Altenheim and Mr. Koppers for a declaration that on August 4, 1914, when war broke out, the patents were in equity the property of a partnership, of which he and the two defendants were the members.

Mr. Terrell, K.C. for the plaintiff, stated that the partnership was known as Koppers' Coke-ovens and By-products Company, of Sheffield. The plaintiff was the only member who was a British subject. His name was originally Koch, his father or his grandfather being German; but Mr. Derry was born and educated in England, and was a British subject. He changed his name to Derry by proper procedure during the war. Mr. Altenheim was born in Germany, but came to this country as a young man, and had been domiciled here ever since, so losing his German nationality. Mr. Koppers was a German residing in Germany. Prior to 1902, Mr. Derry and Mr. Altenheim were in partnership together as engineers, their particular business being connected with colliery plant and machinery. Mr. Koppers was an engineer who had devoted himself to the manufacture of coke-ovens and the by-products plant to be used in connection therewith. Shortly before the war, and principally during the war, the erection of these coke-ovens formed an enormous industry, and what was formerly treated as waste was by the aid of them and the by-product plant now the most important part of the business. Koppers had taken out a number of patents for coke-ovens, which were now known throughout the world as Koppers' coke-ovens, as well as for by-product plant. In 1901 and 1902 negotiations took place with the object of Mr. Derry and Mr. Altenheim, who were trading as Koch and Co., entering into partnership with Koppers with a view to introducing his patents into the United Kingdom and to carry on the business of making and working the ovens and plant. An agreement was prepared in English, translated into German, and sent to Mr. Koppers in Germany, and afterwards retranslated into English. This was what had given rise to the difficulties the Court had now to solve. The agreement as eventually signed was in German. When the war broke out the business was a very considerable one, and Mr. Derry and Mr. Altenheim found great difficulty in obtaining payment of the monies due to the partnership. There was over £100,000. payable to the partners, but having regard to the Royal Proclamation and the fact that Koppers was an alien enemy, it was believed that payment would be a breach of the law. The difficulty was got over by the Board of Trade at the instance of Mr. Derry obtaining an order appointing Mr. Shuttleworth controller of the business under the Trading with the Enemy Act. With the sanction of the Court, Mr. Derry and Mr. Altenheim were appointed managers under Mr. Shuttleworth. Mr. Altenheim was subsequently interned, and during his internment Mr. Derry carried on the business. Considerable litigation had ensued, throughout which Mr. Derry had always insisted that the patents, although standing in the name of Koppers, were not his separate property, but that they were in equity the property of the partnership. In the course of the proceedings, the benefits of the patents were vested in the Public Trustee. Counsel urged that although there was no express term in the agreement that the English patents should belong to the partnership, it was clear that this was the intention. It was proved by the provision that Koppers was to devote all his present and future experience and improvements to the partnership. Koppers did make improvements, and he also made inventions in connection with gas for illuminating purposes, and on this a question arose as to whether the partnership was also entitled to the patents for these gas-producing inventions. That implied that there was no question that the partnership owned the coke-oven and by-product patents. Koppers said the new gas-lighting patents were a different matter, and were his own.

Mr. Derry gave evidence in support of counsel's statement.

Cross-examined by Mr. Austen-Cartmell, for the Public Trustee, he agreed that neither he nor Mr. Altenheim put any capital into the alleged partnership, but said that the capital was ready if it had been required. Nothing was brought in by Mr. Koppers except the patents. All applications for

improvements were made in Koppers' name. The patents did not appear in the balance-sheets of the company, nor were they treated as an asset in the books.

Mr. Claud Barker, a Sheffield solicitor, who had acted for the parties from time to time, said he always understood that the patents were vested in the partnership.

Mr. Altenheim said he endorsed the evidence given by Mr. Derry. He declared that the patents were included as part of the partnership assets, and that so far as he knew Koppers had never objected to this.

The hearing was adjourned.

Mr. Austen-Cartmell, on Tuesday, submitted that the whole facts were inconsistent with the idea of the patents being vested in a partnership. If it had been the intention it would have been so stated in the agreement. It was an adventure to work the patents, and so long as it lasted it was immaterial who owned the patents. No question arose until the sledgehammer of the war descended. This claim was being defended by the Board of Trade on the direction of Mr. Justice Younger (now a Lord Justice of Appeal), who thought it necessary that the matter should be thoroughly sifted.

Mr. Terrell, in reply, contended that although the contract did not in express language set out the arrangement between the parties, it was evident from the carrying out and working of the agreement that the patents were included in the partnership.

Mr. Austen-Cartmell stated that during the war the Public Trustee had made huge profits out of these Koppers patents.

His Lordship, giving judgment, said he accepted the evidence of the parties that in their view the patents were the property of the partnership, and that what they contemplated was a lasting amalgamation of their interests. He had no hesitation in coming to the conclusion that the patents and subsequent improvements, although standing in the name of Koppers, were in equity the property of the partnership. There would be liberty to apply in Chambers for accounts and inquiries, and the costs would be paid out of the assets in the hands of the custodian.

Quality of Cream of Tartar.

A prosecution of considerable interest to the chemical trade came before the Sheriff Court, Glasgow, last week. Mr. William Weir, sanitary inspector, Rutherglen, entered a complaint against James Buchanan, grocer, 16, Main Street, Rutherglen, that on August 1 he sold cream of tartar which contained 0.003 per cent. (one-fifth grain per lb.) of lead, whereas genuine cream of tartar should not contain more than 0.002 per cent. (one-seventh grain per lb.) of lead. The case was brought under Section 6 of the Sale of Food and Drugs Act, 1875. Respondent pleaded not guilty.

Evidence of the purchase having been given by an assistant inspector, the complainer said he took proceedings against respondent because the burgh analyst advised him there had been a contravention. The Local Government Board instructed him some time ago that should a sample show an excess of lead he was to bring the matter into Court. There was, he admitted, no limitation of the percentage of lead in cream of tartar laid down, and accordingly there was no limit or definition of the amount to go upon of lead permissible in the article. The respondent had informed him that he sold the cream of tartar as delivered to him that day. He added that he sold only cream of tartar which had a 98 per cent. purity.

Professor John Glaister, Glasgow University, said pure genuine cream of tartar should contain no lead, but he agreed that no limit had been laid down by any Commission. There was no statutory limitation, but 0.002 per cent. as recommended in Dr. MacFadden's report on impurities was, to his mind, a reasonable standard.

Dr. Ebenezer Duncan said the percentage of 0.002 of lead should not be exceeded in cream of tartar.

Mr. R. Tatlock Thomson, analyst for Rutherglen, stated that up to 1908 he analysed over 100 samples and the average was 0.005 per cent. In 1907 he got one which was 0.007. Since then, however, there had been a great improvement. In recent years, of 98 samples all had conformed to the standard of 0.002 per cent. save two recent cases. The exceptions were very much out—one showing one grain per lb.

Professor Stockman, Glasgow University, called for the defence, said he knew "purified" cream of tartar very well; it was absolutely pure. In small quantities lead was not deleterious to the system. If given more than the body could expel it became cumulative, but the infinitesimal quantities contained in a baking of scones would be absolutely beyond

any deleterious effect that was known. Witness warned people against buying cream of tartar at the grocer's, but by no manner of means could a man receive any bad effects from stuff at 0.003 per cent.

In cross-examination the witness said he would put up the percentage to 0.004.

The Sheriff: So you think we are quite safe eating our scones with 0.003 per cent. of lead distributed in particles throughout them?

Witness: Yes, and far more. Cream of tartar was mostly always contaminated with lead unless you paid a very high price for it. To his mind, it was ridiculous to think that lead in minute quantities could be deleterious and dangerous in food.

The respondent stated that he got no warranty for the stuff, which he purchased from a firm of wholesale grocers. It was an understood thing that he should get it at 98 per cent. purity, but someone had informed him that a mistake had been made in delivering 92 per cent. instead.

James Nicholson, senior partner of Arthur and Hinshaw, chemical merchants, Glasgow, said his firm dealt largely in cream of tartar, of which their turnover was 60 tons per month, and 700 tons a year. The bulk went to wholesale grocers and to bakers, and lesser quantities to chemists. They sold two qualities—92 and 99 per cent., but there ought to be no more lead in the one than in the other. If to a chemist, they must send the 99 per cent. article, if to the others it was a matter of taste which they had to send.

After hearing parties, agents, his Lordship adjourned the diet to Thursday, when he would pronounce his decision.

A Bankrupt's Big Salary.

At the London Bankruptcy Court on Friday last week, before Mr. Registrar Francke, the public examination was held of Alfred Robert Harvey, of 8, Waterloo Place, Regent Street, S.W., against whom a Receiving Order was made in November, 1916. The statement of affairs filed by the debtor showed liabilities amounting to £34,281., and assets showing a surplus of £162,000. after payment of all debts. The principal assets were 22,000 shares in Oil Processes Limited, and 4,636 100dol. shares in Flax Limited.

In reply to the Official Receiver debtor stated that he formed Flax Limited with a nominal capital of one million pounds, and he was entitled to 9,000 £20. shares in the company in consideration of his transferring to them certain patent rights. In December, 1913, Flax Limited agreed to purchase three secret processes relating to the transformation of kerosene in petrol for £50,000. in cash and £60,000. in shares of a new company to be formed under the style of Oil Processes Limited. That company was formed in Canada in December, 1913, with a nominal capital of £1,400,000. Witness was appointed as managing director of the companies at salaries aggregating £23,000. per annum. He acted in that capacity until both companies went into liquidation. He attributed his failure to the stoppage of his salary through the liquidation of the companies brought about as a result of the war.

The examination was closed.

A Tar Contract Dispute.

The Court of Appeal last week dismissed an appeal by Messrs. Brotherton and Co., of Leeds, against the refusal of a Judge in chambers to stay an action under the Arbitration Act brought against them by the Allerdale Coal Company, of Workington. The dispute related to the delivery of coal tar; and the point was whether certain tests should be made at the defendants' or the plaintiffs' works. The Act provides for the settlement of these questions; and defendants asked that this should be done.

Alleged Damage from Picric-acid Fumes.

On Thursday (November 13), before Mr. Edward Pollock, sitting at the Leeds Town Hall as Official Referee of the Supreme Court, the arbitration proceedings were resumed in a case in which the trustees of the late Mr. Richard Kershaw, of Crownest Park, Lightcliffe, claimed £13,400. as damages from Brookes Chemicals (Limited), in respect of alleged depreciation in the value of the estate owing to fumes from the defendant company's picric acid works.

Evidence was given by Mr. J. H. Hanson, land valuer, Huddersfield, who had made an examination of the estate. He

said that all vegetation had suffered because of the fumes, and the enjoyment of the occupation of the house was seriously interfered with. He could not imagine any one going voluntarily to live at a house which was liable to fumes from picric acid works. An estate that was liable to clouds of that character would be difficult to sell, particularly as acid in the stream would render it unsuitable for cattle. A yellow lake might be novel, but it would neither be attractive nor desirable, and would be calculated to destroy the residential value of the estate. In estimating the value of the estate, Mr. Hanson said he computed it to be worth as a whole £28,600. At the sale the property realised £15,000., and the claim was for the difference between that figure and £28,600.

Mr. C. F. Lowenthal, in opening the defence on November 14, said the fumes had entirely ceased since the armistice, and the quantity of acid now remaining in the lake and beck on the estate was altogether negligible. The works were now in process of being dismantled. From a residential point of view, added counsel, these large houses were a dead letter and a drag on the market.

Edward John Silcock, civil engineer, Leeds, said he had examined the estate on several occasions, and whatever may have happened before he went, he could certainly find little damage by fumes. The witness later said that even if the house could be removed to the country, it would be doubtful if a tenant could be found. He was of opinion that the amount secured for the estate was quite as much as it was worth.

When the court adjourned it was announced that the further hearing of the case would be resumed in London early next month, on a date to be fixed.

Profits on Glauber Salts.

The Cheltenham Profiteering Tribunal on Thursday (November 13), investigated a complaint by Miss Harrison that she had been charged by Messrs. Nathaniel Smith and Co., chemists, of High Street, 4½d. for a quarter of a pound of Glauber salts, whereas she could purchase the same sort of salts at another chemist for 1½d. per quarter pound, and at yet another chemist's for 2d.

For the respondents it was shown that the present wholesale price of Glauber salts is 5d. per lb. (against 4d. prior to the war), and that whereas this rise had taken place in the price charged to the firm, they retailed it at 1½d. per quarter lb. less than before and during the war, when it was sold at 6d. per quarter pound. It was admitted that on this basis a gross profit of 325 per cent. was still made; but it was contended that no charge of profiteering under the Act would lie because instead of making a larger profit by enhancing the price to customers, the exact opposite was the case here, the gross profit on the article before the war being 500 per cent.

In the course of the inquiry evidence was also given that before the war Epsom salts, purchaseable wholesale at 1½d. per pound, were almost universally sold at 2½d. per quarter pound, or a gross profit of 800 per cent.

Two witnesses were called to prove that at other chemists' shops in Cheltenham the price of Glauber salts before the war was 6d. and 4d. per quarter pound, that in one case 6d. was still charged, and that in the other the price was 3d.

The tribunal found there had been an overcharge, and ordered the respondents to refund 1½d.

Royal Commission on Inventions.

Message-carrying rockets as used during the war were the subject of a claim before Mr. Justice Sargent and the Royal Commission on Inventions on Monday. The claimant was Mr. E. H. Brittain, a chemist engaged at the Government Experimental station at Claremont Park. He said he made no claim in respect of the mechanical propulsion of the rocket, but owing to its velocity the inventors were unable to discover a flare which would remain unextinguished during flight and so enable the rocket to be seen. Without such a flare the rocket, which travelled to the height of about 4,000 feet, would have been useless in the field. Very soon after he went to the experimental station at Claremont Park he discovered the particular chemical proportion that produced a flare which burst regularly and with satisfaction. In addition to the flare the device required a composition which would emit smoke when the rocket alighted and so enable it to be recovered. In respect of that requirement Mr. Brittain claimed the invention of a particular method of packing which prolonged the emission of the smoke by 100 per cent.

Counsel for the Crown stated that the claimant dealt with an old smoke composition, but in order to make it burn longer he took the risk of melting it into a stick. With regard to the flare, it was submitted that the claimant worked on the analysis of a known powder, and there was nothing which he did which did not come within the ordinary work of a chemist.

The Chairman intimated that the claim would be considered.

Colnbrook Chemical and Explosives Company.

The Official Receiver in the Companies Winding-Up Division of the High Court of Justice has just issued his report under the liquidation of the Colnbrook Chemical and Explosives Company, Limited, of Colnbrook, Middlesex, and 1, Queen Victoria Street, E.C. The company's business had been taken over by a Receiver for the mortgages under the Defence of the Realm Act, and the meeting of creditors is to be held next week at Bankruptcy Buildings, W.C.

The statement of affairs showed as regards creditors, gross liabilities amounting to £95,716 14s. 4d., of which £48,886 2s. 10d. is expected to rank against the estate for dividend. The assets are estimated to produce £56,757 16s. 7d., from which £244 10s. 9d. has to be deducted for the claims of preferential creditors payable in full, leaving the assets at £56,513 5s. 10d. After deducting £46,586 0s. 9d. for the claims of debenture-holders, the net assets are returned at £9,927 5s. 1d., thus leaving a deficiency of £38,958 17s. 9d. With regard to the contributories, the paid up capital is £15,506., to which has to be added the above deficiency of £38,958 17s. 9d., thus showing a total deficiency of £54,464 17s. 9d.

The company was registered on July 20, 1915, with a nominal capital of £21,000, divided into 20,000 ten per cent. preferred ordinary shares of £1. each, and 20,000 management shares of 1s. each, for the purpose of carrying on business as manufacturers of guncotton, explosives and munitions of war; its primary object was to acquire from O. R. Mounsey the benefit of a contract with the War Office for the supply of 200 tons of guncotton and to carry out a contract with the representatives of the Belgian Government for the supply of a minimum quantity of 300 tons of guncotton. The company was promoted by Mounsey, who may have been assisted by others.

The failure is attributed to various causes including incorrect estimates of the company's engineers, late delivery of machinery and further capital expenditure on plant required to meet the demands of the Ministry of Munitions.

ELECTRO BLEACH AND BY-PRODUCTS, LTD.

LARGE CAPITAL INCREASE.

AN extraordinary general meeting of Electro Bleach and By-Products, Ltd., was held in Manchester on Friday, of last week, Mr. H. J. Mackinder, M.P., (chairman), presiding.

It was proposed to increase the capital of the company to £480,000. by the creation of 200,000 7 per cent. participating preference shares of £1. each, and a like number of ordinary shares at 10s. each, while it was proposed to issue 80,000 shares of each class.

Mr. Mackinder, in proposing the resolution, remarked that he was leaving the country very shortly for Russia on an important mission which had been entrusted to him by the Government. He hoped the meeting would agree to the resolution and put the directors into a position to crown and complete the policy which they had been pursuing through fair weather and foul for the last six years. He did not intend resigning his chairmanship, as the board had given him a leave of absence for a few months to visit Russia. The directors at a meeting that afternoon had decided to declare an interim dividend on the ordinary shares for the half-year ended June 30 of 7½d. per share, less income tax at 6s. in the £1.; being at the rate of 12½ per cent. per annum. Referring to the proposed increase of share capital, Mr. Mackinder said he would dispose at once with one obvious criticism which might be levelled against one paragraph dealing with profits during the four succeeding years 1915, 1916, 1917, and 1918. In round figures the profits were £30,000., £50,000., £50,000., and £60,000. During these four successive years it might be said that these results were no guidance for the future in that they referred to war profits. In 1915 the profits were

made under adverse circumstances, in that owing to the war it was impossible to establish economies in the manufacture which had been contemplated, and the same applied in a little less degree to the next year. Then during 1917 and 1918 they were a controlled firm, and were selling to the Government at fixed prices. Strictly speaking, they were selling at a censored profit, and over and above that they were never able to establish the economies intended.

Mr. Mackinder next dealt with the way the directors proposed to use any funds which resulted from the new issue. There were three items, and with regard to the £35,890. due to the Government, he dealt with that at the last ordinary general meeting. It was in respect of plant, buildings, and machinery erected for greater output, and the sum stated still remained to be paid to the Government. A certain amount had already been paid to the Government out of the general reserve fund of the company, and the feeling of the board was that they would like to be masters in their own house, and it would be very undesirable that for a term of years any Government Department should have a claim upon the profits. With regard to the item of £10,000., over and above the plant, machinery, and buildings for which the Government advanced, the Government set up as their own property upon the works certain plant, machinery, and buildings which were left, though Government property, upon the company's land at the conclusion of the war. Such mixed ownership was inconvenient. A bargain had been struck which pleased both parties, and for £10,000. the company had a property which was available for manufacturing purposes. The third item was one of £50,500., with which the directors proposed to redeem the whole of the outstanding Debentures. From the point of view of capital, the company was a relatively small one, and in difficult times and commercial crises it was always well to feel that they had deep water beneath them. From the revenue point of view a small company such as this was better credited in the open market if it was able to say that it had no debentures. That meant they could do better business when they went into the market with their credit in their hands. It was far better at the present moment to give credit than to ask for it. At this moment a firm which was able to give credit in foreign countries in establishing new markets was the firm which was planning well for the future, obtaining goodwill for the future, and they were anxious to lift the company into the top tier of manufacturing companies—companies that can give credit and not have to ask for it. They wished to enjoy the advantage of a company which could say this—No Debentures. The items enumerated roughly came to £96,000., and if they sold their preference and ordinary shares at par there would be left available for extension and developments something like £24,000. The money required to pay dividends of 7 per cent. on the 80,000 new preference shares and 12½ per cent. on the 80,000 new ordinary shares was £10,600. The repayment of the Debentures would mean a saving in Debenture interest and sinking fund of £6,000. per year, and the repayment of the loan from the Ministry of Munitions would mean a saving of interest amounting approximately to £2,150. per annum, leaving therefore a balance of only £2,450. to be found out of the profits.

Mr. Mackinder, proceeding, said they had been able to sell the whole of the issue on favourable terms. The directors had made it a condition that present shareholders in the company should have a preferential right to take shares, provided that they gave notice of their requirements. After all expenses had been paid there would be a considerable margin in the way of premium to the advantage of the company, and that premium would be available to be put in the reserve fund. Referring to the profits of the company during the past four years, the Chairman said these profits had not been obtained at the expense of those whom the company employed. Both the wage-earners and the staff which was paid salaries had had their position steadily improved during the war, and he had no hesitation in saying that the staff and the men were one of their great assets.

Mr. Hutchins, managing director, seconded the resolution, which was unanimously carried.

The meeting then gave their sanction to the necessary alterations in the articles of association.

A special general meeting of shareholders immediately followed, after which came a meeting of Participating Preference shareholders, and both these meetings confirmed the adoption of the resolutions.

The Chairman announced that a further extraordinary general meeting of the company would be held on December 5 to confirm the special resolutions passed.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—There is, of course, no agricultural demand for the Chilean fertiliser at this time of the year, and that for other purposes has been to such an extent checked by the present excessive prices that the European deliveries in the past four months are estimated at only about 90,000 tons; this is just the quantity delivered from all ports (United Kingdom and Continent) in October, 1913, when nitrate was offered at considerably less than half the present prices. These are high enough in all conscience here, but owing to the extraordinary depreciation of the French, Belgian, and Italian currencies (let alone the German mark, which has almost reached the vanishing point), they compare very favourably with those asked abroad, and it remains to be seen whether the foreign farmer will next spring use nitrate of soda on the expected large scale when offered substitutes on much more reasonable terms. The people who have paid 9s. per quintal upwards for nitrate in Chili, and up to £11. per ton freight, may yet discover that they have mistaken their market owing to the aforesaid vagaries in exchange, in which case the Nitrate Producers' Association will meet with difficulties in the fulfilment of contracts. At all events no further sales are reported on the West Coast, and it is already no easy matter to find the tonnage required to move the large quantities sold for delivery up to the end of March. According to the Board of Trade Returns, only 950 tons of nitrate of soda were imported into the United Kingdom in October, value £19,000., or £20. per ton, compared with 16,600 tons in the same month in 1913, before the war.

Dearer Nitrogen for German Agriculture.—A German correspondent says that the German consumer is about to be charged a considerably dearer price for his nitrate manures. The Ministry interested has agreed to the proposition, it is said, submitted by the Fertiliser Committee to increase the price to the consumers by about 50 per cent.; this after having studied the conditions under which nitrogen is produced. The price hitherto per kilogramme of nitrogen in sulphate of ammonia has been 3.90 marks, in nitrate of lime 3.40 marks, and in nitrate of soda 4.40 marks, all for fertilisers only, whilst nitrogen to be used in industrial processes, which has not been under any legal control, has become very much dearer. The great rise in the price results, it is said, after a careful investigation by the Food Department, from the increased cost of production, in which prices of coal, lime, and electricity play a large part. The decision will take effect retrospectively as from October 1, and the object of it is to increase production, particularly of such works as have been working under unfavourable conditions, and in some cases have been brought face to face with enforced stoppage. It is added in this communication that even after the increased price decided on, the foreign price for nitrogen will still be two-and-a-half times higher, and that its object is rather to let the prices for agricultural produce become higher than to go abroad for foodstuffs and fodder at considerably higher prices. From this it would appear that it must be expected at the very least for next year, that agricultural prices will be considerably increased in order to reconcile the farmers with the increased cost of working.

Sulphate of Ammonia.—Business in this material moves quietly. The export trade is apparently dull owing to lack of supplies. It is declared in one authoritative quarter that no quantities of any importance will be available for export before the end of this year. Export quotations are very nominal and are given as between £25. and £30. per ton. The British farmer is obviously still keen on sulphate of ammonia, despite his grumbles about the price. Further information from America just to hand reports that the scarcity of sulphate of ammonia stocks there continues to "feature" the market. Such lots as appear for resale seem to create considerable interest, with holders experiencing no difficulty in obtaining high prices. There is also a good buying interest in America for material over next year. Quotations for such deliveries have been subject to an advance, as well as higher prices being asked for spot delivery.

Nitrolim.—This fertiliser is not as a rule obtainable as yet. The optimistic views expressed earlier in the year do not appear to have come to anything substantial. Germany is declared to have plenty of this manure, but as it is said to cost there £30. per ton, the German farmers are declared to be turning their attention more to synthetic ammonia. It

will be remembered that nitrolim was rapidly gaining popularity in this country up to the spring of 1916, when supplies were diverted to explosives' manufacture.

Basic Slag.—Orders for basic slag come in freely, and a great deal more apparently could be absorbed than is offered. The price of slag is regarded all the way round as very reasonable, and the chief trouble in the section appears to be in the way of securing ready delivery.

Other Fertilisers.—Movements in bone meals and kindred products remain very quiet owing to shortage of supplies. Pure steamed bone meal at £14. 10s., and dissolved bone compound at £8. 7s. 6d. have been traded in. Pure dissolved bones for manure appear to be practically unobtainable at present. East Indian bone meal is priced as high as £16. 10s. in some quarters. Miscellaneous sorts are very quiet, the need in most makes being more ample supplies. Generally the all-round appreciation of fertilisers in the country is increasing. Propaganda in past years, reinforced by the stern lessons of the war, and what appear to be the almost equally stern lessons of the after-war period, have driven home the need for greater food production, in which the basic factor is, and must be, more and better fertilisers.

Alsation Potash.—The imports of Alsation potash salts for the week ending November 15, were 4,471 tons 14 per cent. sylvinite, and 2,193 tons 20 per cent. sylvinite. Current quotations are: sylvinite, 14 per cent. (French kainit), £7. per ton; sylvinite, 20 per cent. (French potash salts), £8. 7s. 6d. per ton; and muriate of potash, 80 per cent., £19. 7s. 6d. per ton.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

The boom that has been created in the tinplate trade shows no signs of relaxation; if there is any alteration, the demand has increased, and orders for the Continent and the colonies are described as almost insatiable. The temporary cessation of American competition doubtless has much to do with the abnormal requirements of foreign trade, and if co-operation can be strengthened between manufacturers and their employees there can be no doubt that for the next couple of years the trade will be well booked up. If those mills which are now idle could be restarted the increase of production would amount to fully 25 per cent. over the present output. The men are now agitating for a six-hour day, and a vote will be taken on the matter.

There has sprung up a strong demand for corrugated galvanised sheets, and this is having a good effect upon the spelter extractors. All the furnaces are working well, and the production of the metal is on the increase.

The patent-fuel trade has never been so active as it is at present, and manufacturers are besieged with orders both for home requirements and export trade. There are no stocks on hand, and the makes of the various factories are readily disposed of. Very little fresh business is being entertained, so great are the demands of old customers.

Some remarkable evidence was given in a claim for damages arising out of a fatal accident to a man named Keene. The action was tried before Mr. Justice Lush at the Glamorgan Assizes. It appears that some steel drums had been purchased from a Sheffield firm of scrap merchants from the Royal Gunpowder Factory, Waltham Abbey. These were resold to a Mr. John, of Llanelly, who employed the deceased to reduce them to scrap sizes, and while using the oxy-acetylene flame a loud explosion occurred which inflicted fatal injuries. Mr. Arthur Lob, the chief chemist of the Llanelly Steel Works, said it was usual for drums of the kind in question to be cleaned of their deposits before being sent to the steelworks. The civil administrative officer of the Royal Gunpowder Factory (Mr. George Henry Clamp) said the drum had contained acid. They would have warned the buyers had they thought that the drums were dangerous. He had no knowledge of what the scrap merchants did with the drums, and was very much surprised to learn of their practice.

All the coke-ovens are working, and there is no difficulty in disposing of sulphate of ammonia.

Basic-slag grinders are fully employed, and there is a slight improvement in the outputs.

ITEMS OF INTEREST.

CHANGE OF ADDRESS.—Messrs. Reitmeyer, Calburn and Kindersley, have removed their general offices to Crown Court, 64, Cheapside, London, E.C.2. Their telephone number is now City 1835.

ALSATIAN POTASH FOR THE TYNE.—The first full cargo of kainite from the mines in Alsace, since the outbreak of the war, came into the Tyne during the week, and was discharged at Messrs. Stephenson's Chemical Manure Works.

ITALIAN FERTILISER INDUSTRY.—Two large Italian artificial fertiliser companies, Società colla e Concimi and Montecatini-Phosphates (Tunis), have amalgamated. The factories of the two companies and their branch establishments are now in a position to supply Italy with $7\frac{1}{2}$ million d.ctr. of super-phosphates.

AMERICAN PHOSPHATE ROCK OUTPUT.—The phosphate rock marketed in the United States in 1918 was 2,490,760 long tons, valued at £1,643,000. As compared with the production in 1917, which amounted to 2,584,287 long tons, valued at £1,554,000., there was a decrease in quantity of 93,527 tons, or 3.6 per cent., and an increase in value of £89,000., or 5.7 per cent..

APPLIED PHYSICS AT GLASGOW UNIVERSITY.—Principal Sir Donald MacAlister, of Glasgow University, on Tuesday announced the receipt of an offer of £20,000. from Mr. John T. Cargill for the foundation of a Cargill Chair of Applied Physics at the University. Mr. Cargill, of the firm of Milne and Co., East India merchants, of Glasgow, is a director of the Anglo-Persian Oil Company and several other oil and rubber companies.

NOBEL PRIZES.—*Reuter's* Stockholm correspondent states that at a meeting of the Academy of Science last week, it was decided to award the 1918 Nobel prize for physics to Professor M. Planck, of Berlin University; the 1919 Nobel prize for physics to Professor Stark, of Grefswald University; and the 1918 Nobel prize for chemistry to Professor F. Haber, of Berlin University. It was decided to hold over the 1919 Nobel prize for chemistry until 1920.

DISCUSSION ON LUBRICATION.—The meeting of the Physical Society of London, on November 28 (at 5 p.m., in the Imperial College of Science, South Kensington), is to be devoted to a discussion on the subject of "Lubrication." The physical qualities of a good lubricant have long eluded capture, and it is to be hoped that the discussion will throw light on the solution of the problem, and, at the same time, create a wider interest in the subject.

LORD LEVERHULME AND THE PROFIT ON SOAP.—Lord Leverhulme, speaking at Port Sunlight last week, and referring to charges of profiteering in soap making, said the profit on Sunlight soap in 1914 was 11 per cent., and to-day 9½ per cent. He courted inquiry, not only for themselves, but for any soap firm in the United Kingdom. During the war and since, they had made their prices as low as the price of raw material would permit, with the maintenance of high quality of the production.

OBITUARY.—Mr. J. L. Young, a director of Messrs. R. Burland and Sons, Bishopgate, Wigan, chemical, oil, paint, and grease manufacturers, has died at the early age of 36 years.—The death has occurred in London of Dr. David Basil Hewitt, for many years a director of Messrs. Brunner, Mond and Co., Ltd. Dr. Hewitt became associated with the firm in 1884, as managing director.—Mr. H. E. Stonier, the managing director of the Vacuum Oil Company, Limited, Caxton House, Westminster, died on Tuesday at his residence, Ashley Gate, Walton-on-Thames, in his 55th year.

SULPHUR DEPOSITS IN ALASKA.—Many of the Aleutian Islands, which stretch westward from Alaska Peninsula towards Asia, bear deposits of sulphur of the type called solfatarae. Sulphur claims have been located at three places on these islands and on the peninsula, one of them in the crater of Makuhin Volcano, on Unalaska Island. The sulphur deposit is the only part of the crater that is permanently free from snow and ice, being kept so by subterranean heat and by the discharge of hot sulphurous vapour. In this crater 10,000 to 15,000 tons of sulphur may be available for mining. Another deposit of sulphur is on Akun Island. It covers 15 or 20 acres, and contains about 1,200 tons to the acre. Still another is on Stepovak Bay, on the south shore of Alaska Peninsula.

DERBYSHIRE LEAD MINES DEAL.—On Wednesday notice was posted by the owners of the Mill Close Lead Mines, near Matlock, that the undertaking has been disposed of privately. Until the transfer is completed the present owners and the new owner desire that working should continue. The notice denies a statement made that the men now employed are to be replaced by those on strike. The mines are considered in the first three in the British Isles for output of lead ore. In the last two years there have been five strikes of the workmen and there is one now, but the employers have been able, with other help, to run the mines, although the smelting works are closed. The ore produced is now sent away crude for export.

CHILIAN CUSTOMS TARIFF PROPOSALS.—The programme of the Chilean Government includes a measure for the revision of the Customs Tariff, and although no actual Bill has yet been introduced into the Legislature, preliminary steps have been taken by a Government Commission, which has been meeting during the early part of the present year, to examine the various requests for Tariff revision presented by manufacturers and others concerned. Among the items in respect of which increased duties are proposed, the following may be mentioned:—Zinc white and lithopone; acids, various (nitric, hydrochloric, sulphuric); liquid ammonia; magnesium salts (oxide, carbonate, Epsom salts); potassium nitrate and iodide, sodium salts—hyposulphite, sulphate, (Glauber salts), bisulphate, calcined carbonate (soda ash), crystallised carbonate (soda crystals), borate, caustic soda, bicarbonate, iodide, also common salt; iodide (pure) and trichloride. Detailed particulars regarding the Commission's recommendations in respect of any individual class of merchandise may be obtained on written or personal application being made to the Department of Overseas Trade, 73, Basinghall Street, London, E.C.2.

SCIENCE AND INDUSTRY.—The opening address of the 166th session of the Royal Society of Arts was delivered on Wednesday by Sir Henry Trueman Wood, vice-president and chairman of the council, on "Science and Industry." It was certainly not true, he said, that science was ignored by British manufacturers. In certain trades—two, for instance, of the most important of all, the iron and steel manufacture and the great alkali trade, with all its ramifications—scientific research was used to the full, while in numerous others it was gradually becoming more and more important. But our advance was much too slow. Our manufacturers were too reluctant to adopt new methods and to abandon old plant. They hesitated to pay enough to secure the services of highly trained experts. They were reluctant to risk capital in costly researches which might prove unsuccessful. They never dared to establish great laboratories, with highly paid experts in charge, for investigations which might prove unprofitable. The result was that they were surpassed, often superseded, by their rivals in Germany and America, who did all those things, and their business was quickly drawn away, and passed into their rivals' hands. They had had, however, a rude awakening. The process seemed to have been effective, for they had certainly realised their position. So far as the application of science was concerned the nation was thoroughly aroused.

THIRTY YEARS AGO.

From "The Chemical Trade Journal" of November 23, 1889.

The Eight Hours' Day in the Chemical Trade.—At the chemical works of Messrs. Brunner, Mond and Co., Northwich, an arrangement has been come to with the workmen by which, instead of working two shifts in twenty-four hours, the day will be divided into three shifts, at slightly reduced rates. The new arrangement will necessitate the employment of three hundred more hands.

Miscellaneous Chemical Market.—The collapse of negotiations to renew the association of manufacturers in the alkali trade has caused a fall in price of bleaching powder for forward delivery. Prices variously quoted for 1890, £5. 5s. to £5. 10s., but on the spot and for early deliveries £6. 5s. to £6. 7s. 6d., f.o.b., are nearest values. Soda ash unchanged and fairly firm at 1½d. Soda crystals in good demand. Chlorate of potash, 5½d. to 5½d. Muriatic acid has been done at lower prices, but 7s. per carboy may be taken as about the average value at makers' works for 1890. Sulphate of copper still maintains a steady sale. Caustic soda, 70%, £7. 5s. to £7. 7s. 6d. Prussiate of potash firmer, 7½d. to 8d. Tartaric acid, 1s. 3½d. Oxalic acid association of makers dissolved as from the end of this year.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions. Orders, and Official and Other Notices.

Motor Sheet Metal Company, Ltd.—Resolved October 6, confirmed October 21: That the company be wound up. Capt. P. E. Slack, 16, Great James's Street, Bedford Row, W.C., incorporated accountant, liquidator.

Roumanian Oil Trading Company, Ltd., London, E.C.—First dividend (to non-enemy creditors) of 10s., at Official Receiver's and liquidator's, 33, Carey Street, W.C. 2, any day except Saturday between 11 and 2 p.m.

Safety Celluloid Company, Ltd.—Resolved October 22, confirmed November 6: That the company be wound up. W. Barton, liquidator. Meeting of creditors, Abbey Road, Park Royal, N.W., November 24, at 2 p.m.

Stonefold Chemical Company, Ltd., Baxenden.—Resolved October 8, confirmed October 25: That the company be wound up. G. L. Hansford, Parr's Bank Buildings, York Street, Manchester, chartered accountant, liquidator. Meeting of creditors at liquidator's, November 14.

Threlkeld Lead Mines, Ltd., Hull.—J. W. Best ceased to act as receiver April 1.

DISSOLUTIONS OF PARTNERSHIP.
(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Seddon Brothers (Wm. Hy. Seddon and Alf. Seddon), Globe Oil Works, Green Lane, Hull: oil, paint, colour, and varnish manufacturers. October 1. Debts by A. Seddon, by whom the business will in future be carried on. (November 7.)

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions. Orders, and Official and Other Notices.

Motor Sheet Metal Company, Ltd.—Resolved October 6, confirmed October 21: That the company be wound up. Capt. P. E. Slack, 16, Great James's Street, Bedford Row, W.C., incorporated accountant, liquidator.

Roumanian Oil Trading Company, Ltd., London, E.C.—First dividend (to non-enemy creditors) of 10s., at Official Receiver's and liquidator's, 33, Carey Street, W.C. 2, any day except Saturday between 11 and 2 p.m.

Safety Celluloid Company, Ltd.—Resolved October 22, confirmed November 6: That the company be wound up. W. Barton, liquidator. Meeting of creditors, Abbey Road, Park Royal, N.W., November 24, at 2 p.m.

Stonefold Chemical Company, Ltd., Baxenden.—Resolved October 8, confirmed October 25: That the company be wound up. G. L. Hansford, Parr's Bank Buildings, York Street, Manchester, chartered accountant, liquidator. Meeting of creditors at liquidator's, November 14.

Threlkeld Lead Mines, Ltd., Hull.—J. W. Best ceased to act as receiver April 1.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Seddon Brothers (Wm. H. Seddon and Alf. Seddon), Globe Oil Works, Green Lane, Hull: oil, paint, colour, and varnish manufacturers. October 1. Debts by A. Seddon, by whom the business will in future be carried on. (November 7.)

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

November 10th to 15th (inclusive).

Manganese or Alloys Thereof. Aktiebolaget Ferrolegeringar. 27,784.
Chromium or Alloys Thereof. Aktiebolaget Ferrolegeringar. 27,785.
Retorting and Briquetting Fuels with Volatile Recovery. Bale, G. F. 27,921.
Preventing Ignition of Combustible Atmosphere by Escaping Products of Combustion. Bohar, V. 27,725.
Preventing Incrustations or Boiler Scale. Bomsel (né Morissens, W.), A. 28,364.
Solutions of Nitrocellulose. Bowles, P. E.; and Titanine, Ltd. 27,797.
Treatment of Ores of Precious Metals. Critchley, T.; and McGhie, T. B. 28,039.
Treatment of Soya Beans for Recovery of Oil. Firth, A. 28,075.
Disazo dyestuffs of Pyrazolone Series. Imray, O. (Soc. of Chemical Industry in Basle). 27,910.
Ore-separating Devices. Jones, A. H. 27,951.
Preparation of Sodium Pentaborate, etc., Direct from Boron Ores. Jones, B. D.; and Kelly, A. A. 28,355.
Purification of Carbazole. Kirby, W.; and South Metropolitan Gas Co. 28,279.
Controlling Temperatures. Lidberg, T. 27,768.
Bottle for Chemicals which Corrode. McMyn, J. W. 28,329.
Gelatine. Malcolm, M. M.; and Townsend, C. S. 27,772.
Containers for Methylated Spirits, etc. Marris, G. S. 27,990.
Carbons, etc. Mellor, J. 28,147.
Electrical Treatment of Gases. Mond, A. (International Precipitation Co.). 28,154.
Converting Higher Molecular Hydrocarbons into Lower Molecular Ones. Naamloze Vennootschap Nederlandsche Lichte Olie Maatschappij. 28,072.
Drying Salts. Parrish, P.; and South Metropolitan Gas Co. 28,278.
Carbonating-apparatus. Pearson, G. 27,897.
Distilling Carbonaceous Material. Perry, W. P. 27,770.
Formation of Briquettes from Disintegrated Peat. Rigby, T.; and Wetcarbonising, Ltd. 28,297.
Expressing Liquids from Peat, etc. Rigby, T.; and Wetcarbonising, Ltd. 28,298.
Recovery of Ammonia as By-product. Serret, A. B. 28,093.
Hydrocarbon Compounds. Stocks, H. B. (Andrews). 27,968.
Solid Ink Compound. Tsutsumi, M. 27,926.
Separation of Metals from Alloys. Walker, T. 28,233.
Running Centrifugal Hydro Extractors. Webster, E. Bullock. 27,841.
Recovery of Ammonia Contained in Gases from Coke Ovens, etc. White, A. E. (Soc. Franco-Belge de Fours à Coke). 28,326.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25 Southampton Buildings, Chancery Lane, W.C.

1916.

Removal and Recovery of Sulphur-dioxide from Gases. Norddeutsche Hutte Akt.-Ges.; and Behrens, J. 2,280. 134,555

1918.

Ammonium Nitrate. Partington, J. R.; and Jones, G. J. 1,874. 134,562

Synthetic Shellac, Resin, or the Like. Bindley, W. T. Robinson; Weller, A. W.; and Dulcken, E. 3,501. 134,563

Substitutes for Celluloid, Vulcanite, and the Like. Bindley, W. T. Robinson; Weller, A. W.; and Dulcken, E. 3,502 and 3,503. 134,564 and 134,565

Concentrating Solutions. Welch, H. V. 17,698. 134,593

Decolorising and Purification of Saccharine Materials. Hood, J. J.; Clark, J.; and Clark, P. G. 18,012. 134,607

Measuring Out Charges of Gases. Menzies, S. H.; and Magraith, H. J. 18,114. 134,615

Magnesia. Delage, J. C. 18,335. 134,626

Still-heads. Dufton, S. E. 18,415. 134,629

Catalytic Oxidation of Benzene. Barrett Co. 18,550. 122,167

Recovery of Potassium Salts from Blast-furnace Slag. Bury, E.; Ollander, O.; Smith, T.; and Bainbridge, F. 20,009. 134,665

1919

Separating Liquids from Vapours. Helmer, N. A. 5,044. 125,939

Liquid Fuel. Marks, E. C. R. (U.S. Industrial Alcohol Co.). 10,712. 134,766

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1919.

Method of Cooling or for Allowing to Crystallise Fatty Emulsions. Erslev, K. 23,585. 134,815

Roasting of Sulphide Ores preparatory to Leaching. Electrolytic Zinc Co. 24,744. 134,825

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Dyes. F. A. Brassard and Crawford, Wakefield; and A. Singer, Bradford. British Patent, 132,390, of 1918.

Monoazo dyes are obtained by coupling the diazo compound of aminoxytoluphenazine (prepared by oxidising a mixture of *p*-nitrosophenol or *p*-aminophenol with *m*-toluylene-

diamine) with phenols, *m*-diamines of the benzene series, or naphthylamine sulphonic acids; phenol, *m*-phenylenediamine, *m*-toluylenediamine, and naphthionic acid are specified as components. The products dye tannin-mordanted cotton yellow to red-brown shades.

Sulphur Dioxide. J. Grayson, Huddersfield. British Patent, 132,387, of 1918.

Sulphur dioxide is obtained free from carbon dioxide by distilling sulphuric acid of 70 per cent. strength, preferably waste acid, with 5 to 10 per cent. of coal-tar pitch or producer-gas tar pitch. The distillation is effected at 170-240° C. until the residual pitch is just liquid enough to be run out.

Distilling Hydrocarbon Oils. L. Clark, Pasadena, California, U.S.A. British Patent, 132,337, of 1918.

Hydrocarbon oils are distilled or converted into products of lower boiling-point by supplying the oil by a pipe 10 into a pipe 9 along which gases of combustion escape from a chamber 1, in which oil or gas from a nozzle 2 is burnt under pressure in a current of air from a pipe 3. The temperature and velocity of the gases are controlled by valves 4, 11, 12 to

obtain temperatures from 1,050 to 1,800° F. or higher, and velocities from 50 to 6,000 ft. per minute, and may also be varied by introducing materials such as steam, oil, gas, sand, etc., into the pipe 9 through a pipe 13. To start the combustion in the chamber 1, a current of gases is drawn through the chamber by opening a valve 6 in a side conduit 7 and injecting air or steam through a nozzle 8.

Sulphur Dioxide. British Dyes, Ltd., J. Turner, and W. B. Davidson, Huddersfield. British Patent, 132,661, of 1918.

The unoxidised sulphur dioxide contained in the exit gases from contact sulphuric-acid plant is absorbed in milk of lime, sodium carbonate solution, or waste sodium sulphite liquor in a scrubber arrangement, and the resulting solution then heated with waste acid products to liberate sulphur dioxide, which is returned to the contact chambers.

Concentrating Sulphuric Acid. F. W. Howarth, London.

(A communication from Norsk Hydro-Elektrisk Kvaelfabrikationselskab, Christiania, Norway.) British Patent, 132,704, of 1919.

In concentrating sulphuric acid passing down a tower T, by a countercurrent of nitrous gases, the gases in the pipe A direct from the electric furnace—and at, say, 1,000° C—are at B mixed with a portion of the moist exhaust gases drawn off through a pipe P, so that, on entering the tower at C, the temperature of the mixture is 500-600° C. The remaining exhaust gas, having a temperature of about 90° C. at D, is drawn to the nitrous gases absorption system through a condenser E, where most of the moisture is condensed and separated.

Acetic Acid. H. W. Matheson, Quebec, Canada. British Patent, 132,558, of 1918.

Acetic acid is prepared by passing large quantities of air under pressure into acetaldehyde in the presence of a catalyst, the temperature being kept not much below the boiling-point of acetaldehyde under the pressure used, and the vapours from the reaction vessel being condensed under substantially

the same pressure as that of the reaction and returned to the vessel. In an example, manganese acetate is the catalyst used, and the initial temperature is 20-25° C., the temperature being raised to 65° C. and the pressure to 75lb. per sq. in.

Decolorising Agents. J. W. Leadbeater, Doncaster. British Patent, 132,572, of 1918.

This invention relates to the treatment of peat to obtain a carbonaceous material for decolorising sugar solutions, oils, waxes, etc. The peat is dried, ground, mixed with ground quicklime, carbonised on trays in a retort or oven, and then washed with a solution of hydrochloric or other acid as described in Specification 122,698. The washed material is mixed with fuller's earth, hydrated aluminium silicate, kieselguhr, diatomite, or other infusorial earth containing nearly pure silica, and is then heated or dried in an oven or retort.

Electrolytic Oxidation of Mercury. H. W. Matheson, Shawinigan Falls, Quebec. British Patent, 132,560, of 1918

In the oxidation of mercury with a continuously agitated electrolyte, the violence of the agitation is periodically increased. A current density of about 55 amperes per sq. ft. of mercury surface is suitable, at 8-10 volts. An acid or alkaline electrolyte may be used—for instance, a 3-10 per cent. caustic soda solution. As shown, a cell is mounted on levelling-screws 31 bearing on blocks 30 which rest on insulators 29 and metal caps 28 surmounting pillars 27. The cell consists of an iron pan having ribs 13 to confine a layer of mercury and to support an insulating-lining 14.

Radiating cathode bars 22 project from a hub 19, and are joined by overlapping inclined blades 24. A stirrer 32, having inclined blades to give an up-and-down motion to the electrolyte, is situated above the mercury anode, and is rotatable at either of two speeds by bevel-wheels 48, 47 connected to a shaft provided with a clutch. The electrolyte is admitted by a pipe 52, and mercury by a pipe 53 leading to a measuring-cup 54. A gauge glass 56 communicates with the electrolyte space and an outlet pipe 58. A hood is provided consisting of a cover 33, a back 35, and a front 36, which may be formed by a roller curtain. Upper and lower outlets 37, 38 are provided for light and heavy gases.

Alkylarylamines. A. Lapworth, and Levinstein, Ltd., Manchester. British Patent, 132,555, of 1918.

N-Monoalkylarylamines are obtained by treating the benzylidene compounds of (1) *p*-substituted monamines of the benzene or naphthalene series, or (2) other monamines of these series which do not form triarylmethane compounds with benzaldehyde, or derivatives of these two types of amines substituted in the nucleus by indifferent groups, with dialkyl sulphates or alkyl esters of benzene sulphonic acid in the absence of alkali, and then hydrolysing the alkyl derivatives

so produced. Examples are given of the preparation of *p*-methylaminophenol, *N*-methyl-*p*-toluidine, and 1-brom-2-methylaminonaphthalene. The Provisional Specification refers also to the use in the process of aldehyde or ketone compounds in general of the above-described amines and of alkylating agents in general.

Potassium Salts. A. Grauel, Toronto, Canada. British Patent, 132,693, of 1918.

In the recovery of potash and potassium salts from silicates, the fume containing the potash from the kiln 1 is pumped into water which is superheated under pressure in the receiver 3, where impurities are deposited, and the potassium compound rises with the vapour and passes through the conduit 6 to the condenser 7. The solution obtained is passed to the evaporator 9. When pure water is used in the receiver 3, potassium hydrate is obtained; a solution of calcium chloride can be used in the receiver for the production of potassium chloride; or gypsum may be mixed with the raw material used in the kiln for the production of potassium sulphate. Other compounds may be introduced for the production of other potassium salts.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Synthetic Resins. Koppers Company, Pittsburg, U.S.A. British Patent, 132,229. Convention date, September 6, 1918.

A light-coloured resin, consisting of polymerised coumarone and homologues thereof and polymerised indene, is prepared from crude solvent naphtha by treatment first with sulphuric acid of strength sufficient only to polymerise the dicyclopentadiene and styrolene present, distilling off the oil containing unpolymerised coumarone and its homologues and indene, treating this with stronger sulphuric acid to resinify the coumarone, etc., neutralising the acid by dilute alkali, separating the oily layer containing the dissolved resin, and finally distilling or blowing off the oils from the resin.

Acetic Acid. Soc des Acieres and Forges de Firminy, Paris. British Patent, 132,529. Convention date, March 13, 1918.

Acetic acid is obtained by hydrating acetylene to acetaldehyde polymerising the aldehyde to paraldehyde, depolymerising this back to aldehyde, and then oxidising the aldehyde to acetic acid. In preparing acetaldehyde, acetylene is passed through a catalysing liquid consisting of aqueous sulphuric acid containing mercury salts together with small quantities of ferric salts and vanadium compounds. The liquid, which gives no sludge during use, is regenerated by electrolytic oxidation. The aldehyde vapour carried along by the excess of acetylene is polymerised by treatment with aqueous sulphuric acid of 15-20 per cent. strength, the paraldehyde is separated and depolymerised by boiling with dilute sulphuric acid. The aldehyde vapours are oxidised to acetic acid by treatment with air or oxygen in presence of a catalyst consisting of copper permanganate or a mixture of copper and manganese salts. Ozonised oxygen, such as that evolved at the anode in reducing aldehyde to alcohol by electrolysis may be used. An apparatus adapted for continuous working comprises a series of towers $t^1 \dots t^4$. Acetylene is passed through the towers $t^1 \dots t^4$ and excess of gas is returned to tower t^2 , being drawn by a fan v . In tower t^1 the spent catalysing liquid is freed from aldehyde prior to regeneration in the tank r . In tower t^2 , aldehyde is formed. The aldehyde vapours are polymerised in towers t^3, t^4 and paraldehyde separated in tank d . The aldehyde vapours obtained from the paraldehyde are oxidised in a fifth tower

(not shown). The catalysing liquid in tower t^2 may be continuously regenerated by arranging a continuous small flow of the liquid through tower t^1 and regenerating tank r .

Liquid Ammonia. Norsk Hydro-Elektrisk Kvaelfstokfaktieselskab, Christiania. British Patent, 132,504. Convention date, September 13, 1918.

Liquid ammonia is obtained from aqueous solutions of ammonia by distillation under pressure. The ammonia solution is boiled in a vessel A, and the resulting vapours are passed through a dephlegmating-column C surmounted by a reflux condenser D. The ammonia gas thus freed from water vapour is led to a condenser F, and the liquid ammonia is collected in a vessel G. Under a pressure of 10 atmospheres, a cooling of the ammonia gas to 25°C . is sufficient to effect liquefaction. The ammonia solution introduced into the vessel A is of 25-30 per cent. strength; the residue from the vessel A is of 20 per cent. strength. The operation may be continuous or discontinuous.

Ammonium Chloride and Sodium Bicarbonate. L'Air Liquide Soc. Anon. pour l'Etude et l'Exploitation des Procédés G. Claude, Paris. British Patent, 131,870. Convention date, August 24, 1918.

Relates to a modification of the process for producing ammonium chloride and sodium bicarbonate from synthetic ammonia described in Specification 130,365. According to the invention, sodium chloride is added to the mother liquor, obtained after separating out the sodium bicarbonate and containing mainly ammonium chloride, in such quantity that it remains dissolved during the subsequent operations, ammonia and carbon dioxide are passed in, and the solution is cooled to separate out ammonium chloride; the solution is then treated with sodium chloride and carbon dioxide to precipitate sodium bicarbonate; these operations are then repeated on the resulting mother liquor to produce more ammonium chloride and sodium bicarbonate. The ammonium chloride produced is heated to nearly 70°C . to destroy any alkalinity. The cooling of the solution to separate out the ammonium chloride may be effected by the evaporation of the liquid ammonia or of the liquid or solid carbon dioxide used in the process.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The arrangement for the exportation of Cumberland coke to the Continent, if it is effected—and there is no reason to believe that such will not be the case.—will come in the nick or time for the plants on the coast. It is evident now that the hematite pig-iron trade will have to become worse before it can become better; and as that has hitherto been the main prop—and, indeed, the only prop—of the coke industry, the outlook would in a very short space of time be distinctly gloomy. It would be idle to pretend that hematite pig-iron makers are not now stocking, and in some cases stocking heavily. The moulders' strike has brought about a pretty state of affairs. The dullness of the steel industry on both the shipbuilding and the rail side means, of course, that the make of ordinary iron for which the local coke is needed cannot be absorbed, and it seems likely that furnaces may have to be dumped down at any moment. East Coast coke supplies this week to West Cumberland are 5,500 tons, and to the Furness district 15,200 tons. The local ovens are working at only a third of their capacity, but there is a hopeful expectation that a contract for 30,000 tons can be fixed up with neutrals on the Continent, in which case, of course, the plants could be maintained in full operation for three months to come. There is a somewhat better feeling in the by-product industry. Benzole and sulphate of ammonia still find a good market, and the stocks of pitch and creosote are being somewhat reduced. There is a better demand for sulphuric acid.

REPORTS OF COMPANIES.

Broken Hill Proprietary Company, Ltd.

The report states that the question of the manufacture of tinplates is well in hand, and the general manager is inquiring fully into the matter in America and Europe, and his report on the subject is now awaited. Owing to the difficulties which the Associated Smelters at Port Pirie have met with in regard to the disposition of their lead output, due to the expiry of the contract with the Imperial Government, they have not been in a position to make the usual advances against products delivered to them, and payments have therefore had to be deferred until realisation is effected. The gross profits for the year to May 31 amounted to £679,957., which, after deducting £27,614. for depreciation, leaves a net profit of £652,342. During the term £530,714. has been expended in construction, the principal item being in connection with the Newcastle Steel Works, which amounted to £527,069. After making due provision for all outstanding liabilities there remain liquid assets, in cash, bullion and other convertible stocks, representing a total value of £1,232,043., which, however, does not include the company's interest of 200,000 shares of the Broken Hill Associated Smelters Proprietary, Limited, and 720 shares of the Zinc Producers' Association Proprietary Limited, but is inclusive of the reserve and insurance funds. The recapitalisation scheme has been carried through in its entirety during the past year and the capital is now as follows:—Authorised capital, £3,000,000. in 3,000,000 shares of £1. each; paid-up capital, £2,100,000 in 2,100,000 shares of £1. each, fully paid up; unissued capital, £900,000. in 900,000 shares of £1. each.

British Oil and Cake Mills, Ltd.

The annual meeting was held in London on Wednesday. Mr. John W. Pearson, who presided, said the Board propose to issue 1,250,000 ordinary shares of £1. each at par. They will be offered to the present ordinary shareholders in the ratio of one new share for each ordinary share now held. The funds are required for working capital owing to the steadily increasing trade and to the higher prices ruling for raw materials, and to pay for new properties. They are at present erecting extensive soap works in Hull, and at Gloucester they are erecting a margarine factory and also a larger refinery. They have arranged with the Greenock Harbour Trust to acquire a site on the James Watt Dock, where they propose to erect at once an oil mill. For the same purpose they are looking for a site in London, where their trade has outgrown their capacity. The report was adopted, and the increase of the capital from £2,000,000 to £10,000,000 was sanctioned.

DIVIDENDS.

CASSTNER-KELLNER ALKALI COMPANY, LTD.—Final dividend of 7 p.c., making with interim dividend 13 p.c. for year ended September 30, 1919.

"SANTAS" COMPANY, LTD.—Interim dividend at rate of 9 per cent. per annum on preference.

LONDON NITRATE, COMPANY, LTD.—Dividend for year ended June 30 of 1s. per share, less tax.

ADVERTISERS' APPRECIATION.

Messrs. MARCUS ALLEN AND SONS, LTD., of Oakley House, Bloomsbury Street, W.C. 1, write under date November 17: "With reference to our advertisement of 'Marelen' Pumps, several hundred inquiries were made from all parts of the country, and also from abroad, within the first three weeks of its appearance in the *Chemical Trade Journal and Chemical Engineer*, and you will be pleased to hear that good business has been the result. As regards our recent advertisement of the 'Monarch' Spray, as you are aware, this has appeared for only one week so far, and we have already had over 200 written inquiries, from which the result has been a sale of over 18 dozen of these sprays, and we are still receiving inquiries about them daily. We have never circularised this spray in any way: the whole result is from the advertisement. We think it only right and fair that you should know of these results from advertising, which we consider are extraordinarily good."

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence further information may be obtained:—

Australia.

A Melbourne firm, with branches at Sydney, Perth, and Fremantle, are desirous of securing agencies for Australia for tanning, wool-scouring, and refrigerating machinery; machinery for the treatment of fats, etc., evaporators, and condensers. (Reference No. 1022.)

A Sydney firm of agents and indentors desire to secure the representation, in Australia, of United Kingdom manufacturers of oilmen's stores, drugs, and chemicals on a commission basis. (Reference No. 1024.)

Canada.

A firm of manufacturers' agents and commission merchants in St. John's are desirous of representing United Kingdom manufacturers of linseed oil for the whole of Newfoundland. (Reference No. 1031.)

The following inquiry has been received at the Office of the High Commissioner for Canada, 19, Victoria Street, London, S.W. 1. All replies should be sent direct to the foregoing address:—

A firm in the Province of Ontario, interested in the importation of quicksilver in large quantities for mining purposes, wishes to get into touch with producers in the British Empire.

The following inquiry has been received at the Canadian Government Trade Commissioner's Office, Portland House, 73, Basinghall Street, London, E.C. 2, whence further information may be obtained:—

A firm in Montreal would like to represent United Kingdom manufacturers of oils, chemicals (industrial or otherwise), and drugs, and is also prepared to act as buying agent for United Kingdom importers of similar lines.

France.

An agent at Melun desires to obtain agencies, on a commission basis, for British firms, for the sale of chemical products and drugs. (Reference No. 1045.)

Sweden.

A firm of general agents, established in Gothenburg, Stockholm, and Malmo, desire to get into touch with British firms exporting chemicals with a view to obtaining their Swedish or Scandinavian representation. (Reference No. 1055.)

Near East.

A firm of exporters in London, stated to have their own representatives in the Near East, desire to represent in that market United Kingdom manufacturers of oil, paints and colours, chemicals, soap, etc. (Reference No. 1057.)

Asia.

A British mercantile agent wishes to secure the representation of United Kingdom manufacturers of paints and enamels, toilet preparations, and soap of all kinds. (Reference No. 1059.)

MARKET REPORTS.**TAR AND AMMONIA PRODUCTS.****WEDNESDAY.**

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d., naked; pure, 3s., naked, at works. Carbolic acid, crude, 60%, East and West Coast, nominally 1s. 7d. to 1s. 8d.; crystals, 39-40%, 3½d. to 9d., f.o.b. Crude tar, London, 45s. to 50s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Refined tar, 32s. 6d. per barrel. Pitch, 80s.; East Coast, 70s. to 75s., f.o.b.; West Coast, 62s. 6d. to 65s., f.a.s. Solvent naphtha, naked, London, 90-190%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 95-160%, naked, London, 2s. 6d.; North, 2s. 4d. to 2s. 5d. Crude naphtha, naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthaline, £16. to £18.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 5½d.; heavy oil, 6½d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 7d. to 2s. 8d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: home trade, November £20. 15s., basis 24½%. Nitrate of soda, £22. 10s. to £22. 15s.

FERTILISER MATERIALS. LIVERPOOL, THURSDAY.

Nitrate of soda is very firm, but the quotation on spot for 95/96% quality for prompt delivery remains £20. 2s. 6d. per ton, net cash, f.o.r. East Indian bone meal for November December shipment is without alteration, the quotation for 4½% ammonia and 52% phosphates being £17. 10s. per ton, net cash, ex ship Liverpool. Owing to the easier freight market in the forward position, shippers indicate £13. per ton, net cash, ex ship Liverpool, for January-February shipment, 4½% and 52% quality. On spot, holders ask £17. 10s. per ton, net cash, for 4½% and 45% quality. Mineral phosphates are without alteration and values at present are only nominal. Dried blood: Supplies of this article are scarce, and full prices are being paid for any parcels offering, the value being 32s. 6d. to 35s. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.**THURSDAY.**

Copper: Standard brands, £97. 15s. to £98., cash; £99. to £99. 5s. three months; electrolytic, £111. to £114. Tin: Standard, £282. 10s. to £282. 15s., cash; £284. to £284. 5s. three months; Straits, £282. 10s.; English, £281. 10s. to £282. 10s. Lead: Soft foreign, £34. 12s. 6d.; English, £35. 10s. Spelter, £46. 12s. 6d.; hard, £33. to £34. Antimony, English regulus, 90%, £47. 10s. Aluminium, £150. Nickel, £205., delivered; packages extra. Quick-silver, £17. 5s. to £17. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 32s. 6d. per unit.

MANCHESTER CHEMICAL MARKET.**THURSDAY.**

The inquiry for heavy chemicals continues active, both for home and export account, and quotations, generally, are firm with an upward tendency. Resale lots of 70% caustic soda are scarce, and price higher at £26. per ton. 58% alkali is dearer at £10. 10s. per ton, and refined bicarbonate soda, bags, at £9. 15s. ex store. Soda crystals steady at £5 5s. rails. Chlorate of soda is in fair request at 5½d. per lb. Potash dull at 1s. per lb. Roasted saltcake, in bulk, 70s. per ton carriage paid. Recovered rock sulphur, £17 on rails. Sulphate of copper continues flat, and export price unchanged at £40. per ton f.o.b. Bichromate of soda is in strong inquiry at 11d. Potash unaltered at 1s. 6d. per lb. Commercial hyposulphite of soda is steady at £19. per ton. Phosphate of soda £29. per ton. Nitrite in short supply, and price firm at £61. per ton, basis 100%. Concentrated sodium sulphide, £23. per ton in casks. White powdered arsenic is dearer, and £65. is now asked for Cornish brands. Yellow prussiate of potash quiet at 1s. 9d. per lb. Soda well maintained at 1s. 1d. per lb., and makers fully engaged with orders. Lead salts rather dull again, but values without alteration. White acetate at £84. per ton. Brown, £67. Nitrate, £55. Acetate of soda, £49. per ton. Acetic acid, quiet and unchanged. English brown acetate of lime firmly maintained at £12. 10s. Grey, £19. per ton. Miscible naphtha, 10s. 6d. per gallon. Green coppers dull at £4 5s. in sellers' wagons. With the clearance of foreign supplies, oxalic acid has a firmer tendency, and 1s. 2d. to 1s. 2½d. per lb. is now quoted. Permanganate of potash, commercial crystals, 3s. 3d. per lb.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on November 15 were: American, 32,384 barrels, compared with 3,208 barrels at the corresponding date of 1918; French, 904 barrels (1,029 barrels); and Spanish, 318 barrels (1,130 barrels). Deliveries during the week ended November 15 were 1,718 barrels, against 521 barrels last year, and since January 1, 65,765 barrels, compared with 22,461 barrels in 1918. The price on Saturday last was 126s. 3d. per cwt., compared with 105s. at the corresponding date of last year. November-December delivery was quoted at 126s. 9d., and January-April (1920) 128s. 9d.

SWANSEA MARKET REPORT.**THURSDAY.**

Great activity prevails in the tinplate market, and prices are very firm on the basis of 45s. 6d. per standard box, f.o.b. Copper is somewhat easier, with a fair demand for over three

months at £101. per ton and £99. 15s. cash. Tin active for prompt delivery at £283. 15s. cash and £284. 15s. three months. Lead in good inquiry at £34. 7s. 6d. over next quarter and £31. 5s. prompt. Spelter quiet and easier at £47. 5s. Antimony £47. 10s. Quicksilver £17. 10s. Nickel £205. delivered. Aluminium £150. Pitch in rather better supply at 62s. 6d. per ton at ship. Bonemeal 17s. 6d. per cwt. net. Sulphate of ammonia very steady at £20. 15s. per ton prompt and £21. forward. Sulphate of copper quiet but steady, with prompt at £41. per ton, f.o.b.; home quotations £1. less. Nitrate of soda very steady at 21s. 9d. per cwt., in bags. Palm oil rather quiet and easier: Lagos, £88. 10s.; softs, £88.; Benin, £86. 10s.; and hards, £85. per ton. Turpentine £5. 7s. 6d. per cwt. Arsenic in better request at £58. per ton for white powdered, in bags. Oxalic acid rather quiet at 1s. 0½d. per lb.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

Inquiries for chemicals have come in freely, the export branch of the trade again being well in evidence. Stocks of some of the heavier articles are still light, so that prices continue very firm. Bleaching powder has been in good request, though in limited supply. The price for home trade uses is £17. per ton, free on rail or conveyance, in buyers' packages; and for export £15. to £18. per ton. Chloride of calcium has been rather more in demand, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has been well inquired for; prices are: 76%, £24. per ton; 70 to 72%, £22. per ton; and 60 to 62%, £21. per ton. Nitrate of soda has been in moderate request, and is £21. to £22. per ton. Saltcake has again been in very fair demand, and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have sold with some freedom, and are £5. 10s. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been rather more in demand, and is £8. 5s. to £10. per ton, according to terms of delivery. Borax has been in very fair request, and is £39. per ton for ordinary and £40. per ton for powdered, in bags, less 3% for lots of not less than 50 tons. Ammonia alkali has been in good request, and is £6. 10s. to £6. 15s. per ton, f.o.r. at works. Hyposulphite has been rather more inquired for, and is £18. 10s. per ton for ordinary and £22. per ton for pea crystals, in 1cwt. bags. Sulphite of sodium has been in moderate demand, and is £10. per ton for ordinary and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been quieter, and is £22. per ton in casks and £23. per ton in drums. Prussiate of soda has been more in request, and is 11d. to 1s. per lb. Bichromate of soda has been in slightly better request, and is 9½d. per lb. Phosphate of soda has been more inquired for, and is £26. per ton. Chlorate of potash has been steadily called for, and is 1s. to 1s. 1d. per lb. Permanganate has sold more readily, and is 3s. 6d. per lb. Sulphate of potash has been but little in request, and is £25. per ton. Carbonate of potash has been in moderate demand, and is £95. to £100. per ton for 80 to 85%. Caustic potash has been in good request, and is £120. per ton. Nitrate of potash has been in quietly steady demand, and is £55. to £60. per ton for refined and £40. for ordinary. Canadian potashes have been but little called for. First quality Montreal is £200. to £220. per ton, and second quality £190. to £210. per ton. Bichromate of potash has been quiet, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been rather more in request, and is 1s. 9d. to 1s. 10d. per lb. Salammoniac has met with a fair inquiry, and is £90. per ton for first quality, £85. per ton for second quality, and £5. per ton extra for crushed. Sulphate of ammonia has had a limited sale; it is £20. 15s. per ton for November, £21. for December, £21. 7s. 6d. for January (1920), £21. 15s. for February, and £22. per ton for March to May (1920). Carbonate of ammonia has been in moderate demand, and is 6½d. per lb. Muriate has been quiet, and is £48. to £50. per ton, according to grade. Magnesia has been in very fair demand. Carbonate is £2. 5s. per cwt., and sulphates £11. to £16. per ton, according to grade. Alum has been steadily called for, but scarce, and is £18. 10s. per ton for the home trade and £18. 10s. to £19. 10s. per ton for export. Aluminoferic has been in very limited demand, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been but little in request, and is £12. to £17. per ton, according to grade. Sulphur has been in fairly active demand. English flowers are £32. per ton; roll is £28. per ton, and rock £22. per ton, in bags, f.o.r. Sicilian grades are: Flowers, £28. per ton; roll, £22. 10s. per ton; and rock, £17. 15s. per ton. Cream of tartar has been in somewhat freer request, and is £12. 5s. to £12. 10s. per cwt. Tartaric acid has again met with a fair inquiry,

and is 3s. 2d. to 3s. 3d. per lb. Boracic acid has been quieter; crystals are £72. per ton, and powdered £74. per ton, and £2. to £3. extra if delivered in casks. Oxalic acid has moved but slowly, and is 1s. to 1s. 1d. per lb. Citric acid has sold rather more freely, and is 4s. 3d. per lb. White acetate of lead has been quiet, and is £83. per ton. Arsenic has been in moderate demand, and is £60. per ton for white powdered. Sulphate of copper has been very quiet. Prices are £40. per ton for the home trade, and £40. to £41. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Market continues steady without much alteration in prices, and inquiry both for home and export is good. Locally, soda crystals are in strong request at £5. 10s. per ton, 2cwt. bags. Rock sulphur scarce and firm.

The following prices are per ton net: Bleaching powder, softs and hards, £18.; caustic soda 76/77%, £25.; do., 74/76%, £24. 5s., do., 70%, £23., do. 60%, £21.; recovered sulphur, 2cwt. bags, £24.; hyposulphite of soda, 5/7cwt. casks, £19., 1cwt. kegs, £25.; sulphite of soda, 5/7cwt. casks, £12., do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d., do. 100° Tw., £10., do. 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda (saltcake) in bulk, £4.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22.; sulphide of sodium, crystals, £18., do., refined-concentrated solid, 60/62%, £25.; hydrate of barium, do., crystals, £56.

COALS. Market very strong both for prompt and forward, and a considerable amount of business for export to Allied countries has taken place for delivery in the early months of next year. Prompt prices nominally: Best Northumbrian steam coals, 95s. to 100s. per ton, second qualities, 90s. to 95s.; Northumbrian small coals, 75s. to 80s., seconds, 67s. 6d. to 72s. 6d.; best Durham gas coals, 80s. to 85s., seconds, 65s. to 75s.; Durham bunkers, 70s. to 80s., seconds, 65s. to 67s. 6d.; foundry coke, 100s.; gas coke, 95s. to 100s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

During the past week a fairly brisk demand has been passing in all classes of chemicals, and while big deals have not been particularly conspicuous, yet in bulk the week's transactions have amounted to a big volume. Prices remain more or less stationary, with a rising rather than a lowering tendency; but the only appreciable change over the week is in the case of cream of tartar, which is now selling at £12., as against £11. 15s. per cwt., net, Glasgow. Current quotations now are: Arsenic, £64. per ton, net, Glasgow; bicarbonate of soda, £10. 10s. and £12. 10s. per ton for 6-8cwt. casks and 1cwt. kegs, net, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags; and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £25. per ton net, Glasgow; chlorate of potash, 1s. 1d. per lb., net, Glasgow; chlorate of soda, 8d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 98%, £12. per cwt., net, Glasgow; paraffin wax, U.K. deliveries, 125°, 6½d. to 6¼d.; 121-30°, 5½d. to 5¼d.; 118-20°, 5d.; 110-120°, 4d. to 4¼d.; and 98-102°, 4d. to 4½d.; salammoniac, £95. and £85. per ton, net, any port, for first and second lump respectively; salammoniac crystals, £70. per ton, net, Glasgow; saltpetre, £3. 2s. net, Glasgow; tartaric acid, 3s. 3d. per lb., 5%, Glasgow.

There are no changes in the sea oil section, either as regards supply, demand, or prices. Whale oils keep to their old figures of 94s. for pale, 76s. for brown, and 76s. for black (with yellow still unobtainable); while Newfoundland cod is also retaining its former price of 80s. Pale seal is still on offer at 96s., and menhaden at 80s., and it is interesting to note that the full range of prices given above has been in operation in every case during the last four or five weeks. The only variation over that period has been in the case of whale oil of the pale variety, which, after being as low as 90s. in the middle of October, has since jumped back (as stated above) to 94s.

In the West of Scotland coal trade it is still a question of the demand being greater than the supply, and an exceptionally severe spell of cold weather did not ease the position. Both industrially and domestically, the requirements are considerably heavier now that the winter is in fuller swing, and there is no difficulty in getting rid of all fuel as it reaches the pithead.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending November 15.

ACETATE OF LIME—
Gothenburg, 273 bgs.; Philadelphia, 1,014 bgs.

CREAM OF TARTAR—
Valencia, 40 cks.

DEXTRINE—
Baltimore, 215 bgs.

DYESTUFFS—
Tanning Extract
Newport News, 200 brls.

FERRO SILICON—
Rouen, 39 cks.

GLUE—
Gothenburg, 453 bgs.; Rouen 41 brls.

IRON PYRITES—
Huelva, 2,033 t.

OCHRE—
Newport News, 258 brls.; Rouen, 11 cks.

PARAFFIN WAX—
Philadelphia, 695 brls.

ROSIN—
Lisbon, 35 cks.

SOAP—
Newport News, 30 brls.; Philadelphia, 2,000 bxs.

TAR—
Gothenburg, 105 brls.

TAR OIL—
Gothenburg, 23 cks.

TARTAR EMETIC—
Rouen, 10 cs.

WHITE LEAD—
Philadelphia, 82 brls.

ZINC SULPHATE—
Gothenburg, 4 cks.

GOOLE.

Week ending November 15.

CAUSTIC SODA—
Rotterdam, 47 drms.

GLUE—
Antwerp, 32 bgs.

PHOSPHATE—
Antwerp, 140 t.

GRANGEMOUTH

Week ending November 15.

FERRO SILICON—
Skien, 151 cs.

GRIMSBY.

Week ending November 15.

NIL.

HULL.

Week ending November 15.

BARYTES—
Rotterdam, 41 cks.

FATTY ACIDS—
Amsterdam, 198 brls.

Bombay, 2,200 t.

OCHRE—
Rouen, 10 cks.

PHOSPHATE (ROCK)—
Sfax, 5,900 t.

TALLOW—
Auckland, 19 brls., 915 cks.; Napier, 721 cks.

TAR (WOOD)—
Trondhjem, 100 brls.

TARTARIC ACID—
Helsingfors, 53 brls., 9 cs.; Venice, 98 cks.

LIVERPOOL.

Week ending November 15.

AMMONIA—
Havre, 4 cs.

AMMONIUM SULPHATE—
Montreal, 1,833 bgs.

BEES WAX—
Rotterdam, 10 brls.

BISMUTH ORE—
W. C. S. America, 16 sks.

BORATE OF LIME—
Buenos Ayres, 1,962 bgs.

CANDELLILLA WAX—
Galveston, 19 sks.

CARBON (DECOLOURIZING)—
Amsterdam, 20 bgs.

CARBON BLACK—
Baltimore, 150 cs.

CHEMICALS (otherwise undescribed)—
Havre, 23 cs.; Montreal, 13 pkgs.

COPPER PRECIPITATE—
Seville, 2,832 bgs.

DYE EXTRACTS (otherwise undes.)—
Norfolk, 2,795 bgs.

DYESTUFFS—

Alexandria, 3 t. 17 c., £241.; Amoy, 3 t. 13 c., £720.; Auckland, 2 t. 6 c., £115.; Barcelona, 1 t. 6 c., £270.; Beira, 1 c., £8.; Bombay, 1 c., £8.; Calcutta, 4 t., £191.; Cape Town, 14 t. 7 c., £551.; Canterbury, 2 c., £21.; Dundee, 1 t. 9 c., £189.; Durban, 12 t. 6 c., £457.; East London, 1 t. 2 c., £51.; Grey-mouth, 3 c., £25.; Haifa, 3 c., £6.; Havana, 1 t. 11 c., £92.; Hong Kong, 5 t. 11 c., £832.; Invercargill, 7 c., £42.; Iddo, 7 c., £56.; Kilindini, 3 t. 9 c., £197.; Lyttleton, 8 t. 16 c., £413.; Mombasa, 9 c., £18.; Montreal, 6 t. 7 c., £257.; Napier, 1 c., £8.; New York, 19 t. 8 c., £672.; New Plymouth, 12 c., £70.; Penang, 2 t. 4 c., £68.; Paris, 4 t. 12 c., £125.; Pt. Elizabeth, 1 t. 10 c., £88.; Paysandu, 15 c., £52.; Shanghai, 5 t. 9 c., £179.; Singapore, 4 t. 18 c., £170.; Sydney, 3 t. 8 c., £151.; Wellington, 1 t. 9 c., £207.; Westport, 2 c., £12.; Zanzibar, 2 t. 5 c., £15.

ETHER

Alexandria, 5 cs., £21.; Batavia, 7 cs., £5.; Shanghai, 5 cs., £34.; Tientsin, 4 cs., £9.

ETHER (ACETIC)—

Jaffa, 1 cs. (pt.), £8.

ETHER (SULPHURIC)—

Madras, 16 cs. (pt.), £50.

ETHYL CHLORIDE

Rangoon, 1 cs. (pt.), £15.

FLUORIC ACID—

Pt. Elizabeth, 3 cs., £89.; Singapore, 1 cs., £21.

FORMALDEHYDE—

Alexandria (F.), 2 cs., £7.; Amsterdam (F.), 6 brls., £165.; Buenos Ayres, 5 cks., £147.; Buenos Ayres (F.), 4 cs., £14.; Shanghai (F.), 1 cs., £10.

FULLER'S EARTH—

Colombo, 3 t.

GALLIC ACID—

Antwerp, 1 cs., £38.

GELATINE—

Constantinople, £17.

GLUE—

Stockholm, 5 t.

GLUE (MARINE)—

Hong Kong, 5 t.

GLUE, SIZE, AND GELATINE—

Alexandria, 1 c.; Amsterdam, 3 t. 3 c.; Antwerp, 13 t. 10 c.; Bergen, 1 c.; Bilbao, 1 t.; Bombay, 1 c.; Brisbane, 1 c.; Calcutta, 1 t. 1 c.; Canary Islands, 2 c.; Cape Town, 5 c.; Cologne, 16 t. 15 c.; Colombo, 3 c.; Durban, 4 t. 1 c.; Demerara, 7 c.; Gibraltar, 3 c.; Hong Kong, 1 c.; Lourenco Marques, 1 c.; Melbourne, 3 t. 4 c.; Montreal, 3 t.; Ostend, 1 c.; Pt. Elizabeth, 3 c.; Rio de Janeiro, 3 c.; Rotterdam, 5 t.; Shanghai, 1 c.; Wellington, 10 c.

GLYCERINE (DISTILLED)—

Alexandria, 2 c., £17.; Beyrout, 1 cs., £5.; Constantinople, 1 t., £130.; Paris, 7 t., £938.; Rio de Janeiro, 4 c., £31.; Santos, 2 c., £15.; Singapore, 2 c., £18.

GLYCEROPHOSPHORIC ACID—

Cape Town, 1 cs., £16.

HYDROCHLORIC ACID—

Antwerp, 5 c., £26.; Trinidad, 1 t., £44.

HYDROCYANIC ACID—

Pt. Elizabeth, 1 cs., £8.

HYDROGEN PEROXIDE

Alexandria, 4 c., £19.

HYDROGEN PEROXIDE—

Durban, 1 cs., £5.; Haifa, 2 cs., £5.; Malta, 3 cs., £9.; Melbourne, 5 cs., £34.; Paris, 38 cys., £63.; Pt. Elizabeth, 3 cs., £15.; Suez, 3 cs., £18.

HYPOPHOSPHORIC ACID—

Sydney, 1 cs. (pt.), £7.

INFUSORIAL EARTH—

Paranagua, 1 t. 12 c., £42.; Rio de Janeiro, 2 t. 1 c., £54.; Santos, 1 t. 4 c., £32.

IODINE (RESUBLIMED)—

Bangkok, 4 cs. (pt.), £11.; Brussels, 1 cs., £101.; Buenos Ayres, 1 cs. (pt.), £51.; Mauritius, 1 cs. (pt.), £7.; Sydney, 1 cs. (pt.), £13.

IRON AND AMMONIUM CITRATE

Buenos Ayres, 1 cs., £11.; Pt. Elizabeth, 1 cs., £13.; Rosario, 2 cs., £43.; Sydney, 1 cs. (pt.), £5.

IRON & METHYL SALICYLATE—

Valparaiso, 1 cs. (pt.), £6.

IRON CITRATE—

Ghent, 3 cs., £125.

IRON IODIDE—

Buenos Ayres, 1 cs., £19.

IRON PYROPHOSPHATE—

Montreal, 1 cs., £11.

IRON PYROPHOSPHATE AND AMMONIUM CITRATE—

Gothenburg, 1 cs., £45.

LACTIC ACID—

Callao, 1 cs. (pt.), £25.; Melbourne, 5 cks., £93.; Paris, 1 ck., £17.

LEAD ACETATE—

Constantinople, 1 ck., £9.; Mauritius, 1 ck. (pt.), £10.; Pt. Elizabeth, 1 ck., £11.; Rouen, 20 cks., £415.; Taganrog, 5 cks., £181.

LEAD NITRATE—

Fremantle, 44 brls., £588.; Paris, 12 cks., £175.

LITHIUM CARBONATE—

Antwerp, 1 cs. (pt.), £12.

MAGNESIA (CALCINED)—

Bordeaux, 1 cs., £17.; Cartagena, 7 cs., £35.; Lisbon, 1 cs., £15.; Panama, 2 cs., £20.

MAGNESIUM CARBONATE—

Alexandria, 3 cs., £9.; Buenos Ayres, 3 cs., £18.; Genoa, 50 cs., £119.; Panama, 2 cs., £21.; Paranagua, 4 cs., £9.; Pt. Elizabeth, 1 cs., £6.; Rouen, 30 cks., £107.

MAGNESIUM CITRATE—

Buenos Ayres, 3 cs., £24.; Cape Town, 2 cs., £11.; Piraeus, 1 cs., £7.; Rangoon, 7 cs., £54.

MAGNESIUM SULPHATE—

Bombay, 4 c., £14.; Cape Town, 8 c., £17.; Durban, 10 c., £22.; Grenada, 14 c., £12.; Jamaica, 1 t. 3 c., £55.; Paranagua, 5 c., £7.; Porto Alegre, 9 c., £23.; Port Said, 1 t., £51.; Tientsin, 3 c., £6.; Wellington, 10 c., £20.

MERCURIAL SALTS—

Perth, 1 cs. (pt.), £5.; Melbourne, 1 cs. (pt.), £25.

MERCURY IODIDE—

Taganrog, 2 cs., £340.

MERCURY OXYCYANIDE—

Antwerp, 1 cs. (pt.), £88.

MERCURY PERCHLORIDE—

Durban, 4 cs., £11.

MERCURY SUBCHLORIDE—

Durban, 4 cs. (pt.), £11.

METHYL ALCOHOL—

Rangoon, 1 cs., £17.

METHYL SALICYLATE—

Antwerp, 4 cs., £110.; Durban, (F.), 1 cs., £6.; Taganrog (F.), 1 cs. (pt.), £8.

NICKEL AND AMMONIUM SULPHATE

Soerabaya, 2 kgs., £19.

OXALIC ACID—

Melbourne, 1 ck., £53.; Montreal, 24 cks., £1,058.; Shanghai, 2 pkgs., £19.

PARALDEHYDE—

Adelaide (F.), 1 cs. (pt.), £6.

PHOSPHORIC ACID—

M'bourne, 2 cys., £10.; Montreal, 28 cys., £150.; Paris, 45 cys., £430.; Rangoon, 2 cs., £7.

PHOSPHORIC & CITRIC ACID—

Cape Town, 4 cs., £35.

PLUMBAGO

Adelaide, 12 c.; Delagoa Bay, 2 t.

POTASH—

Perth (F.), 2 c., £27.

POTASH (ALUM)—

Brussels, 2 cks., £4.

POTASSIUM BICARBONATE—

Alexandria, 1 cs., £9.; Brussels, 1 ck., £8.; Cape Town, 1 cs., £7.; Durban, 1 cs. (pt.), £5.

POTASSIUM BICHROMATE—

Hamburg (F.), 2 t. 1 c., £327.; Valencia, 3 cks., £200.

POTASSIUM BROMIDE—

Buenos Ayres (F.), 1 cs. (pt.), £22.

POTASSIUM CARBONATE—

Cape Town, 1 kg., £11.; Sydney, 1 kg., £13.

POTASSIUM CARBONATE AND OXIHYDRATE—

Madras, 10 cs. (pt.), £7.

POTASSIUM CHLORATE—

Colombo, 1 c., £15.

POTASSIUM CHLORIDE—

Bangkok, 1 c., £9.; East London, 1 c., £14.; Monte Video, 2 c., £30.; Pt. Elizabeth, 1 c., £6.

POTASSIUM CITRATE—

Barbados, 2 cs. (pt.), £7.; Melbourne, 4 cs., £115.; Pt. Elizabeth, 1 cs., £15.; Rangoon, 1 cs., £12.

POTASSIUM CYANIDE—

Bangkok, 2 c., £55.; Hong Kong, 3 cs., £82.; Monte Video, 3 c., £48.

POTASSIUM HYDROXIDE—

Melbourne, 1 cs. (pt.), £7.

POTASSIUM IODIDE—

Adelaide, 1 cs. (pt.), £11.; Antwerp, 1 cs., £39.; Bombay, 1 cs. (pt.), £8.; Buenos Ayres, 1 cs., £18.; Bangkok, 5 cs., £337.; Barbados, 2 cs. (pt.), £44.; Mauritius, 1 cs. (pt.), £5.; Melbourne, 1 cs., £90.; Pt. Elizabeth, 1 cs., £19.; Singapore, 1 cs., £87.; Sydney, 2 cs., £90.; Taganrog, 3 cs., £255.; Trinidad, 1 cs. (pt.), £8.

POTASSIUM METABISULPHITE—

Bombay, 10 cks., £145.; Cape Town, 3 kgs., 6 c., £121.; Montreal, 30 pkgs., £435.; Paris, 4 cks., £224.; Toronto, 43 pkgs., £370.

POTASSIUM PERMANGANATE—

Antwerp, 2 c., £56.; Beyrout, 5 c. (pt.), £7.; Calcutta, 1 kg., £12.; East London, 1 cs. (pt.), £6.; Iquique, 1 cs. (pt.), £5.; Karachi, 1 cs. (pt.), £6.; Mauritius, 1 cs. (pt.), £7.; Melbourne (F.), 1 cs., £20.; Taganrog, 10 cs., £192.

POTASSIUM PRUSSATE—

Rabat, 1 ck., £6.

POTASSIUM SULPHATE—

Durban, 4 cs. (pt.), £7.; Iquique, 1 cs. (pt.), £17.

POTASSIUM SULPHOGALICOLATE—

Antwerp, 2 cs., £560.; B. Ayres (F.), 1 cs. (pt.), £30.

PYRO ACID—

Antwerp, 1 cs., £38.; Bombay 1 cs. (pt.), £6.; Shanghai, 1 cs. (pt.), £5.

QUININE—

Cape Town, 63 ozs.; New York, 4,000 ozs.; Singapore, 36 ozs.

RESORCIN—

Montreal, 1 cs., £85.

SALAMMONIAC—

Sydney, 3 c., £11.

SALICYLIC ACID—

Durban, 1 kg., £13.

SALT

Boulogne, 10 t.; Brisbane, 10 t.; Lagos, 39 t.; Rangoon, 9 c.

SALT—

Rio de Janeiro, 29 t.; Rotterdam, 2 c.; Townsville, 2 t.

SALTPETRE—

Bahia, 10 c., £29.; Barcelona, 1 t. 11 c., £78.; Buenos Ayres, 1 t. 11 c., £78.; Christiania, 2 t., £109.; Durban, 5 c., £15.; Lisbon, 3 t. 13 c., £199.; Oporto, 2 t. 19 c., £160.; Pernambuco, 156 t. 14 c., £7,902.; Porto Alegre, 10 c., £29.; Rio de Janeiro, 11 t. 15 c., £717.; Santos, 6 t. 3 c., £369.

SHEEP DIP—

Buenos Ayres, 30 t. 8 c., £1,699.; Durban, 9 t., £348.; Wellington, 5 t. 8 c., £266.

SILVER NITRATE—

Alleppey, 1 cs. (pt.), £6.; Auckland, 3 cs. (pt.), £145.; Cape Town, 1 cs. (pt.), £14.; Durban, 1 cs. (pt.), £11.

SOAP—

Aalesund, 7 t. 4 c.; Adelaide, 3 c.; Amsterdam, 4 c.; Aden, 2 c.; Antwerp, 81 t. 18 c.; Amsterdam, 3 t. 13 c.; Auckland, 3 c.; Antwerp, 248 t. 8 c.; Barbados, 6 c.; Bilbao, 3 c.; Beira, 1 t. 16 c.; Bombay, 14 t. 15 c.; Boulogne, 32 t. 6 c.; Brisbane, 1 c.; Buenos Ayres, 3 c.; Bordeaux, 6 c.; Calcutta, 11 c.; Canary Islands, 1 c.; Canton, 1 c.; Cape Town, 1 t.; Channel Islands, 6 c.; Christiania, 11 c.; Christchurch, 6 c.; Cologne, 57 t. 4 c.; Colombo, 2 c.; Copenhagen, 2 t. 16 c.; Cyprus, 5 c.; Durban, 9 c.; Dunedin, 2 c.; Hankow, 2 c.; Hobart, 2 c.; Ipoh, 1 c.; Iquique, 1 c.; Jaffa, 5 c.; Karachi, 16 c.; Kilindini, 5 c.; Limon, 1 c.; Madras, 10 c.; Melbourne, 10 c.; Mombasa, 2 c.; New York, 7 c.; Penang, 7 c.; Pernambuco, 2 c.; Pt. Said, 3 t.; Pt. SODA ASH—

Antwerp, 19 t., £153.; Genoa, 38 t. 8 c., £378.

SODA CRYSTALS—

Aden, 10 c., £5.; Batavia, 8 c., £12.; Colon, 10 c., £7.; Piraeus, 3 c., £10.

SODIUM ARSENITE—

Delagoa Bay, 1 t. 2 c., £78.

SODIUM BENZOATE—

Buenos Ayres, 5 cs., £76.; Lisbon, 1 cs. (pt.), £5.; Mauritius, 1 cs. (pt.), £10.

SODIUM BICARBONATE—

Brussels, 4 c., £7.; Calamata, 8 c., £12.; Calcutta, 1 c., £6.; Switzerland (via Ostend), 5 t., £80.; Paranagua, 5 c., £6.

SODIUM BISULPHITE—

Lisbon, 10 drms., £78.

SODIUM CITRATE—

Cape Town, 1 cs., £12.; Melbourne, 1 cs., £25.; Rosario, 1 cs., £22.; Sydney, 1 cs. (pt.), £6.

SODIUM CYANIDE—

Delagoa Bay, 32 t., £3,255.; Fremantle, 6 t., £558.; Paris, 3 c., £23.

SODIUM GLYCEROPHOSPHATE—

Constantinople, 1 cs., £40.

SODIUM NITRATE—

Bombay, 35 cs., £147.; Montreal, 1 t., £110.

SODIUM PHOSPHATE—

Brussels, 2 t., £17.; Rio de Janeiro, 18 t. 2 c., £477.

SODIUM PRUSSATE—

Genoa, 2 t. 19 c., £329.

SODIUM SALICYLATE—

Bombay, 1 cs. (pt.), £13.; Cape Town, 6 cs. (pt.), £111.

SODIUM SULPHATE—

Batavia, 7 c., £11.

SODIUM SULPHATE (GLAUBER SALTS)—

Cartagena, 2 t. 10 c., £27.; Panama, a. qty.

SODIUM SULPHITE—

Stockholm, 10 c., £17.

SODIUM TARTRATE—

Calcutta, 3 cs., £19.; New York, 10 cks., £140.; Paris, 2 t. 12 c., £286.

STEARINE—

Wiborg, 42 t. 12 c.

SULPHUR—

Alexandria, 2 c., £9.; Paranagua (F.), 72 bgs., £108.; Rio de Janeiro (F.), 3 t., £90.; Santos (F.), 2 t. 8 c., £72.; Shanghai, 1 c., £6.

SULPHUR (FLOWERS)—

Paris, 10 c., £20.

SULPHUR (ROLL)—

Paris, 11 t., £275.

SULPHURIC ACID—

Antwerp, 4 c., £11.; Alexandria, 4 t. 3 c., £165.; Demerara, 6 t. 5 c., £108.; Madeira, 9 c., £37.; Madras, 2 c., £6.; Trinidad, 6 t., £96.

SUPERPHOSPHATES (otherwise undescribed)—

Cape Town, 310 t., £3,105.; Channel Islands, 50 t., £400.; Colombo, 65 t., £913.; Durban, 20 t., £210.; Mossel Bay, 20 t., £208.

TANNIC ACID—

Cape Town, 1 cs., £10.; Cape Town (F.), 1 cs. (pt.), £6.; Karachi, 4 pkgs. (pt.), £7.; Lisbon, 1 pkg. (pt.), £7.; Shanghai (F.), 1 pkg. (pt.), £8.

TAR (STOCKHOLM)—

Fiji, 1 t. 5 c.; Jamaica, 1 t. 1 c.

TARTARIC ACID—

Bombay (F.), 1 cs., £7.; Bombay, 2 c., £46.; Cape Town, 19 c., £332.; Durban, 5 c., £92.; Durban (F.), 4 c., £56.; East London, 4 c., £74.; Jamaica (F.), 1 c., £20.; Karachi (F.), 1 c., £23.; Madras, 4 c., £89.; Mauritius, 1 cs., £6.; Pt. Sudan, 2 c., £38.; Rangoon, 1 c., £10.; Shanghai, 1 c., £22.; Taganrog, 5 c., £87.; Wellington, 1 c., £14.; Antwerp (transit) (F.), 10 c., £200.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ..	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

TO PREVENT DUMPING.

THE Imports and Exports Regulation Bill, which had its first reading in the House of Commons last week, constitutes, we hope, a step towards finality in the framing of our national commercial policy. The absence of anything of that nature has had a most disturbing influence upon industry generally, and to an appreciable extent has retarded the recovery of industry from the position into which it was forced by the war. Although not directed exclusively to that end, the Bill is, primarily, a measure for the prevention of the dumping of foreign goods into this country, and the very keen discussion which will certainly take place in Parliament will centre upon that aspect of it. As will be seen from the Schedule appended to the Bill, the industries that it is desired to protect are almost wholly concerned with the manufacture of chemicals and allied products, and in its present form one would be justified in designating it a Chemical Industries Protection Bill. The probability is, however, that further articles affecting other industries will be added to the schedule as the measure emerges from its successive stages. Briefly stated, the object is to prevent the dumping of foreign goods similar to those produced in this country, at selling prices lower than those prevailing in the country of origin. This definition of dumping has been substituted for the one previously approved of officially by the leaders of the Government—viz., the sale of foreign goods in British markets at prices below the actual cost of production,—and in our view it carries with it the merit of providing a more effective safeguard for goods of British manufacture. That the Bill will meet with powerful opposition in the course of its passage through the House of Commons is certain. One of the great lessons of the war is already being forgotten by many people, even

among those who would disclaim sympathy with those politicians whose objection to the Bill, apparently, is founded on nothing more substantial than a rooted aversion to any alteration of "our traditional Free Trade policy." Legislation on the broad lines laid down in the Bill is, however, essential, and it is, indeed, time that the question of providing adequate protection for British "key" industries was approached with minds refreshed with the knowledge of the dangers that confronted the Empire during the years of the war, and with a complete disregard for political traditions.

THE PATENTS BILL.

THE fact that the Patents Bill is now before the House of Lords should quicken interest in this measure. The circumstances attending it we have already discussed in connection with the conference which was held on the subject at the British Scientific Products Exhibition in July. On that occasion leading engineers and patent lawyers agreed that before any Bill amending the admittedly imperfect patent law, as it exists at present, was passed through Parliament, there should be a conference between all parties concerned with the object of arriving at a draft Bill which could be sent to the Government representing the views of industry. Presumably, in drafting the present Bill the Government consulted somebody, but having regard to the fact that the House of Lords, or rather members of it, have received protests and suggestions from trade and technical associations, it seems a little difficult to imagine who, outside the Law Officers of the Crown, have advised the Government. Some members of Parliament, and among them no less a patent authority than Sir George Croydon Marks, are inclined to take the view that the Government Bill is a step forward and ought to be accepted as being better than nothing. Our view, and the view of many others, is that if we are to have an amending Bill—and it is undoubtedly wanted,—let us have a comprehensive one, and not deal with this important question piecemeal and in a manner which will carry us over only for a few years. The Government endeavoured to get this Bill rushed through the House of Commons at the end of the Session in August, but happily, although they succeeded in doing that, they were unsuccessful in securing the adherence of the House of Lords to the same policy. Hence the measure is now before that body. If, in general, the Bill as drafted is to become law, one of the greatest injustices in it—viz., its treatment of the inventor whose invention could not be worked during the war—must be redressed. We and others have all along contended that these specifications ought to be extended for the period during which they could not be worked, and patents which expired during the war period ought to be extended for a period equivalent to that during which they could not be worked on account of war conditions. To say that a general extension of all patents for two years meets the case with regard to these unfortunate inventors to whom we have referred, is to beg the question entirely. There are many

points of technical detail in the Bill which will need discussion and to which we will not refer now, but an ample case has been made out for a much more complete investigation of the position than has apparently yet been done. There still seems in official circles too much of that antiquated feeling that the inventor is a man who, by reason of his patent specification, is an enemy of the community at large, in that he is given a limited monopoly in order to be able to exploit the results of what his own brains and inventive genius have produced. Far better would it be if he were more often looked upon as the benefactor of mankind, for the inventor has in countless directions benefited humanity; indeed, the whole industrial progress of the world is due to the inventor, and yet, in this country at any rate, he finds himself regarded with suspicion at almost every turn.

POWER SUPPLY.

CHEMICAL engineers are indirectly, if not directly, interested in the present state of affairs with regard to the supply of electricity and gas throughout the United Kingdom. The Government have just got their Electricity Supply Bill through the Standing Committee, and we also know that fresh legislation is on the *tapis* dealing with the gas industry. The position with regard to electricity is that Electricity Commissioners are to be appointed who will have general supervisory powers over all developments of electricity supply, and under them will work District Boards which, in certain defined areas, will work the whole business of electricity supply with a view to arriving eventually at some state of uniformity. At present the greatest chaos exists in the sense that there are hundreds of power stations, many of them serving quite small areas; there are dozens of voltages both generating and distributing, and generally uniformity is conspicuous by its absence. With regard to the gas industry, the authorities at Westminster seem at last to have been brought to a realisation of the fact that illuminating power is no longer a factor in gas supply, and that even in lighting calorific power is the criterion. Consequently, we are promised legislation in the near future to place the gas industry on a fresh basis, and, incidentally, enable it to bring its charges into line with the position created by the war. The basis of this new legislation is to be that gas shall be charged according to its heating value instead of by the thousand cubic feet. Incidentally, with all this legislative activity, the criticism has been levelled that the Government ought to take in hand as one thing the reorganisation of the power and lighting problems of the country irrespective of what the motive power or lighting agent may be. In other words, this line of thought foreshadows a close alliance between the gas and electrical industries under something approaching Government control. Whatever may develop in that direction, it is clear that the services of chemists will be in greater and greater demand in both industries, and a specially fine field will be offered to the chemical engineer in the next few years.

HEAT ECONOMY IN CHEMICAL PLANTS.

BY HARALD NIELSEN.

THE recent abstract in the *Chemical Trade Journal* and *Chemical Engineer* of the paper by Mr. C. J. Goodwin on "Waste-Heat Boilers and Pulverised Fuel," really leaves one wondering why the paper was written. We all know that a deplorable waste of coal has taken place in chemical and other works in the past, but even if waste-heat boilers and pulverised fuel were widely adopted to-morrow, the thermal efficiency obtained would be regarded ten years hence as ridiculously low, at any rate as regards power purposes.

With reference to waste heat recovery from chimney gases by means of modern economisers, etc., I consider that at the present stage of development in boiler practice there is not much lost. The leading engineers of Great Britain specialising on boiler plant can, I think, be relied upon to see that nothing which can be profitably recovered is lost, and I should say that few people in this country or in the United States can teach them much. What is really wanted is an entirely new method—a great departure from existing things,—and I do not find any such hint or suggestion in the abstract of the above paper.

Then there is the question of exhaust boilers deriving heat from the exhaust gas from gas engines. This has also been carried as far as can be done at present. Generally, from the exhaust from large gas engines 2.5 to a maximum of 3lb. of steam can be generated per B.H.P. hour, and unless the gas engine is of at least 500 B.H.P. it does not pay to install a boiler. How many of these big power units are to be found in the chemical industry? Mr. Goodwin must be aware that if the exhaust gases are cooled down below a certain temperature, say 120° to 150° C., excessive corrosion due to the nitrogen compounds formed in the gas engine, takes place, and it would be almost as bad as if Mr. Goodwin placed a waste-heat boiler behind a saltcake furnace. The paper indicates no fresh thought in this particular case either.

Any modern firm erecting retort settings takes good care to utilise the waste heat in heat-interchangers, or for pre-heating both primary and secondary air to as high a degree as possible. When the gases leave the setting for the chimney there is not much left in them, and here again it is a matter of £. s. d., in the form of extra power, if induced or transformed draught can be applied instead of natural draught. There are, of course, old plants here and there, but their life will not be long now—they simply must disappear; the cost of coal prevents them from being used.

Mr. H. M. Ridge's remarks in the discussion were very much to the point, and I think that most engineers will agree with him that the proposition should be tackled from the beginning—that is, from the furnace door,—and then if the economy has been carried as far as it is possible here, it is time to look round and see if something more is to be got from the tail end—i.e., the waste flue gases.

As far as pulverised fuel is concerned, this country is not lagging so far behind the States, as is suggested by Dr. Ormandy and Mr. Harvey, and I wonder if the Americans did not get the powdered fuel idea from Europe? There are many powdered fuel installations in Great Britain; I know of a very large cement works on the Thames where large rotary kilns are fired solely by this fuel, and have been for many years past. Not so

long ago, within a few miles from London, I carried out some calcining tests in a small rotary kiln, fired with coal dust, with success. I should like to point out, however that to install powdered-coal firing plant is not quite so easy as it sounds. It will take the operators a considerable time before all goes "safely." It is in large works where great quantities are used daily that the powdered-fuel firing may be advantageous over gas firing. I very much doubt whether many owners of small works can afford to train up people and install plant for this fuel.

The handling of powdered coal is a highly technical matter. The raw coal must first be dried in effective dryers and rendered almost free from moisture before grinding can take place. In order to insure a good furnace efficiency the powdered fuel must not leave much more than from 3 to 5% residue on a 200-mesh sieve. Then comes the storing of the fine dust. This must be carried out in almost air-tight containers, and moisture must at all costs be kept away—therefore large quantities cannot be stored at a time with safety. The fuel ought to be used as soon as possible after grinding—that is to say, every works must possess their own drying and grinding plant.

The idea that one large central dépôt or grinding plant should be able to supply a number of works in the vicinity with powdered fuel does not at all appeal to me, and I think the same feeling will animate most people who have used powdered coal. The special covered trucks and quick delivery necessary, owing to the storage-in-bulk danger, must be an insurmountable difficulty, for some years to come at any rate.

There is a certain element of danger in using powdered coals, and there will always be. Mr. Goodwin may be able to suggest something fresh to overcome the various small but very real obstacles, but I do not see any indication of such in his paper. I remember that a few years ago the Americans were starting up a very large cement works, and when coal-dust firing was commenced in one of the huge rotary kilns a big explosion took place, partly demolishing the whole works. Even at works where experts in preparing and firing with coal dust are in charge, unforeseen accidents are difficult to eliminate entirely. I have seen heavy drying drums crumpled up like paper, and I have also seen spontaneous combustion take place, even in the small feeding hoppers for the feeding nozzles, so that the red-hot, already burning dust had to be fed into the furnace at as quick a rate as possible to prevent further damage.

I have tried to point out that the use of powdered fuel cannot be indiscriminately carried out with the same facility and safety as, for instance, with producer-gas firing proper, at any rate not at present, before radical alterations have been carried out so as to render the drying, grinding, and storage of coal dust safer and cheaper than at present. I believe it will be some time yet before coal-dust firing can be placed in the hands of an ordinary semi-skilled workman.

On the other hand, producer-gas firing is safe, and the advantages claimed for powdered coal are fully met by this with none of the drawbacks. Very inferior fuel, containing as much as 30 per cent. ash and a large percentage of smalls and dust, can be most successfully dealt with in a suitable modern producer, of which there are

many well-trying types. Naturally, there are the usual producer losses, amounting to 15 to 20 per cent., but in competition with coal-dust firing such losses are balanced by the cost of drying and grinding, etc. For large works the by-product recovery producer plant will easily beat the coal-dust plant as a financial proposition, and after all, this, in conjunction with safety, is what we are looking for.

Taking a broad view of the fuel economy question, it appears to the writer that the true way is first to carbonise the coal by a low-temperature operation—recovering the oils and a proportion of the ammonia,—and then to treat the solid coke residue in “producers,” by these means producing a very large quantity of cheap fuel gas, and at the same time recovering the bulk of the ammonia and other by-products.

EXAMINATION OF HYDROGENATED OILS.

EIGHT samples of hydrogenated vegetable oils (cotton-seed, earth-nut, linseed, and sesame oils) and six samples of hydrogenated fish-oil were examined by G. Reiss (*Arbeit. Reichsgesundheitsamte*); their chemical and physical characters were similar to those of ordinary edible fats, and their suitability for human consumption was confirmed by the results of feeding experiments. The quantities of nickel and arsenic present in the samples were usually negligible; the largest quantity of nickel found was 0.36mgm. per kilo of hydrogenated earth-nut oil, whilst the largest quantity of arsenic was 0.1mgm. (As_2O_3) per kilo.

The following extraction method was found to be more sensitive than the usual incineration method for the detection and estimation of nickel: 200grms. of the fat are melted in a flask, 100 c.c. of 12.5 per cent. hydrochloric acid and a small quantity of potassium chloride are added, and the mixture is heated in a boiling water-bath for one hour with frequent agitation. After cooling, the liquid is separated from the solidified fat, filtered, and an aliquot portion of the filtrate evaporated to dryness in a porcelain basin. The residue is dissolved in 20 c.c. of water, the solution rendered ammoniacal, boiled, filtered, and the filtrate treated in the usual way with dimethylglyoxime solution. The precipitate obtained—if nickel is present—is collected and weighed; it contains 20.31 per cent. of nickel.

To detect and estimate arsenic, 20grms. of the sample are melted in a porcelain basin, and 20 c.c. of a mixture of 10 parts of fuming nitric acid and 1 part of concentrated sulphuric acid are added drop by drop while the fat is stirred. After the contents of the basin have been heated for some time on a water-bath, they are mixed with 30grms. of a mixture of equal parts of sodium nitrate and potassium nitrate, and the mass is transferred, in small portions at a time, to a platinum basin containing 5grms. of the sodium-potassium nitrate in a molten condition. When the incineration is complete, the mass is cooled, dissolved in about 200 c.c. of water, the solution acidified with dilute sulphuric acid, boiled to remove carbon dioxide and nitrous acid, and filtered. The filtrate is treated with 10 c.c. of 11.12 per cent. crystallised aluminium sulphate solution, then rendered ammoniacal, heated for thirty minutes on a water-bath, and filtered. The precipitate is washed with dilute ammonia; the filtrate is acidified with sulphuric acid, and again treated with aluminium sulphate and ammonia. The two precipitates are united, dissolved in

35 c.c. of 10 per cent. sulphuric acid, and the solution heated on a water-bath until all nitric acid has been expelled (diphenylamine test). Ten grammes of concentrated sulphuric acid are then added, together with sufficient water to make the total weight about 50grms., and the solution is transferred to a Marsh apparatus, and the estimation carried out in the usual way.—*The Analyst*.

MARKET FOR CHEMICALS IN SOUTH AFRICA.

THE chemicals in demand in South Africa are those used in the mining industry. The ones that are being used mostly, and the amount imported, are as follow:—

In 1917 there was a small amount of nitric acid brought in, of which about 20 per cent. came from the United States. Sulphuric acid was formerly a large item of import, coming mainly from England, but now it is manufactured locally, and importations have decreased considerably. A little tannic acid is imported, but to no great amount, only 1,454lb. being brought in during 1917. All this came from the United States, whereas in 1914 Germany, Italy, and Switzerland were the sources of supply.

Ammonia for ice making is of growing importance here, in view of the fact that the meat-export trade is rapidly increasing in importance. However, this chemical is being made locally in connection with one of the explosive works. There are several large explosive factories here making all the blasting explosives required for the mining industry, and it is these plants that are turning to various by-products. In 1917 there was roughly £8,800. worth of ammonia brought into South Africa, of which England and Australia furnished 75 per cent., almost equally divided, and the United States furnished the remainder.

Borax is a fair item of import, and is all listed as coming from the United Kingdom, even prior to the war. Calcium carbide is one of the heaviest items of import. In 1917 a very large proportion came from Canada, with only 119,610lb. out of 4,283,643lb. coming from the United States. In 1914 9,824,146lb. were brought in, of which 3,846,495lb. came from Canada, 4,360,365lb. from Norway, 1,062,857lb. from Sweden, and 523,611lb. from the United States, with small amounts from other countries.

Carbonate of soda is another important item of import, but it is now being produced in British East Africa. In 1917 3,011,055lb. came from the United Kingdom, 112,000lb. from British East Africa, and 56,605lb. from the United States. Caustic soda is used to a considerable extent in soap-making, and in 1914 243,000lb. came from the United States, out of a total of 3,897,996lb., the remainder being practically all from England. In 1917 5,647,851lb. were imported, of which 2,693,945lb. came from the United States, the remainder from England.

Chloride of lime was imported in 1917 to the extent of 745,451lb. from England, 8,960lb. from Japan, and 3,280lb. from the United States. Sodium cyanide used on the mines centred at Johannesburg was imported to the extent of 7,868,811lb. in 1917. In 1914 the United Kingdom furnished 5,416,295lb., and Germany 4,637,885lb., out of a total importation of 10,084,868lb. —*U.S. Com. Rep.*

THE USE OF ZINC IN PAINT.*

BY W. HOMER HENDRICKS.

THE rapidly increasing demand for zinc oxide as a paint pigment and its value as an ingredient in protective coatings are subjects to which students of paint problems are at present devoting a great deal of attention. A brief consideration of the qualities and properties of zinc oxide, however, soon reveals why it has attained the popularity which it so justly deserves and why its star is still in the ascendancy in popular favour.

A well-made paint is no haphazard blending of pigments and vehicles selected and proportioned at the whim of the maker. Each constituent has its own part to play. To devise and put together a product which will retain its appearance and provide the maximum of protection over the longest possible period of time under such conditions of surface, application, exposure, and climate as may be imposed on it is a problem which taxes alike the maker of a paint and the one who applies it. In practically all cases those who make judicious use of zinc oxide come out winners in the race over those who do not.

We have in paint what are termed "base pigments"—that is, pigments which supply the "body" of all white and tinted coatings. The quality of a paint depends very largely upon the proper selection of these base pigments, whether considered from the point of view of its working qualities by the painter or its wearing qualities and protective effect on the surface over which it is applied. The "hiding power," or capacity to conceal the surface over which the paint is applied; the spreading rate, or the area over which it will extend in a continuous layer and present fair "covering" or hiding properties when applied with a brush; the protective power, or ability to preserve the surface over which it is applied from natural agencies of destruction; the class of surface produced, whether "flat," "oil finish," or "enamel"; these and many other valuable properties are to a considerable extent determined by the proper selection and use of the base pigment. With these principles in mind, let us consider zinc oxide in its relation to them.

Zinc oxide possesses important qualities peculiar to it alone. In whiteness, permanence, fineness, oil-absorbing properties, inertness towards other pigments, non-poisonous qualities, and durability it takes front rank. When exposed to air containing sulphur gases it does not change colour, since the sulphide of zinc, if any were formed, is as white as the oxide. It does not chalk or crumble and does not become transparent. In view of these statements, the question arises—Why not use zinc oxide in all paint? Why any other constituents?

For interior use, where a glossy surface, easily cleanable, and highly sanitary as well as decorative, is desired, such a paint is eminently satisfactory. For exterior use zinc oxide, when used alone, in common with all other pigments, has certain economic drawbacks, which vanish entirely when it is used in a properly compounded mixed paint. Continued experimentation has proved conclusively that a paint made up with a single pigment is never as satisfactory as one made up with a combination of pigments.

In the first place, owing to its extreme fineness, zinc oxide forms a perfect blend with the oils of the vehicle, and in consequence spreads out under the brush in an exceedingly thin layer. Hence, in order to secure the

thickness of paint coating necessary to hide and protect properly, more coats of paint are required than would be the case with a coarser pigment. Coarse-grained pigments absorb less oil, consequently they do not spread as far, and, as a result, cover better over a limited area. When such pigments are mixed with zinc oxide they check the tendency of that pigment to excessive spreading.

There seems to prevail among the painting profession an erroneous impression that zinc oxide is quite deficient in covering power. This is due to the fact that, because of its extreme fineness, it brushes out so thinly. In reality, however, if taken, weight for weight, in comparison with other white paint pigments, and confined to the same area over which those pigments will spread, zinc oxide will be found to have a far superior covering and hiding power.

Secondly, a paint consisting of zinc oxide and linseed oil only dries with a hard, smooth surface. The advantages of this quality will be considered later. The disadvantage is that when in the course of years the oil becomes dry and decomposed (as happens, sooner or later, with all paints), the paint coat may crack and peel off in patches. White lead, the pigment most generally combined with zinc oxide, does not do this. When a white lead paint coat fails it does so by gradually and progressively crumbling to powder, a process called "chalking." The powder of "chalk" weathers off and a fresh surface is presented, which in turn powders. A chalking paint presents an even surface for repainting.

If white lead is used alone, however, chalking progresses with unnecessary rapidity, so that the protective coating is soon disintegrated and the elements gain access to the wood in a relatively short time. Moreover, a white lead coating is subject to the formation of tiny cracks, which make a fine network pattern all over the paint film called "checking." As the paint weathers these cracks enlarge and deepen until they are open down to the wood, exposing it to the action of sun and rain. It, therefore, is apparent that the presence of zinc oxide, which does not check nor chalk, is necessary in a paint to stabilise it and prevent the rapid perishing of the protective film.

It becomes evident, then, that when we make a paint composed of zinc oxide and white lead we secure the advantages proper to each of these pigments. The zinc oxide imparts whiteness, durability, permanence of colour, high oil absorption, and smoothness of surface. The white lead assures a heavier film, and thus increases the covering or hiding capacity of the paint, and insures a satisfactory surface for repainting when, in the course of time, the paint shall have perished.

Zinc oxide does one thing more—it furnishes a smooth, easily cleaned surface. If we paint two boards, one with zinc oxide and one with white lead, and expose them to a dusty atmosphere, the white lead board will accumulate dust much faster than the zinc oxide board. The smooth, even surface of the latter makes it very difficult for particles of dirt to adhere, while the comparatively rough surface of the former holds them. This is particularly well shown when a wet sponge is passed over the boards. The zinc board will show up clean and white after this treatment, while the lead board will remain dirty. A board painted with a combination of these two pigments behaves in this respect like a board painted with straight zinc oxide. The zinc oxide, owing to its excessively fine state of division, blends so thoroughly with the oil that it enters the glossy surface which the oil forms over the paint so that the surface of

* New Jersey Zinc Co., New York.

the paint coat has the same relative dirt-resisting and wet-repelling power that a straight zinc oxide paint possesses. At the same time the mixture does not tend to crack and peel and gives a good surface for repainting. The effect of this property on the protective value of the paint is obvious.

POTASH MINES OF ALSACE.*

THEIR FUTURE PROSPECTS.

AFTER the technical installation which has taken place in the past few months, the moment has come when the economic aspects of the potash industry have to be considered. This industry, which Germany used and abused as if it were a monopoly, must be emancipated. Freed from all shackles, it must take its place in the economic life of France; the markets of our Allies and the neutrals must be opened wide to it.

CAPITAL TO BE EMPLOYED.

Prudence and sagacity are required. The German "Kali fever" must be avoided, for she looked upon potash merely as a speculation. That disease in Germany had the fatal effect of the absorption of too much capital. This caused a permanent crisis, from which the potash industry has suffered for more than 50 years and which rages to-day in a worse form than ever. The Alsatian deposits must not be exposed to the same dangers.

A lesson can be learned from the German balance-sheets, with their fictitious assets and arbitrary valuations, with their enormous capitals which an unhealthy speculation sunk in the mines, and their mortgage loans, the proceeds of which were distributed by the mine-owners unblushingly. On the other hand, only as much capital as is absolutely indispensable must be employed by the Alsatian mines.

If only the strictly necessary capital has to bear interest the margin for the fixing of the selling prices will be all the greater, and any further capital which may be offered can be made use of in the opening up of the deposits. It will thus be all the easier to compete with German potash.

THE COMPETITION OF GERMAN POTASH.

The production of potash is no longer a monopoly capable of imposing its own conditions. The future of the Alsatian mines depends on the ability and the far-sightedness of their management and the resources by means of which German potash is to be countered. Germany has a great advantage over Alsace owing to the fact that, the potash industry having been long established, she has gained an experience and organisation which are denied to Alsace. But, nevertheless, the importance of this must not be exaggerated.

The potash industry of Germany fears the Alsatian industry. Alsace rises before Germany at a moment when the economic outlook in Germany is darkening: over-capitalisation, difficulties of transport, and difficulties of coal and labour. Many shafts had to be shut down, others are flooded, and the remainder are unable to supply even the needs of her own country. So far German agriculture has received but 800,000 tons, as against the 900,000 tons which she had consumed in the same period last year. No wonder that Germany has been compelled to decline orders from abroad, nor is it a wonder that self-interest induces Germany to try to come to an understanding with Alsace.

ORGANISATION OF THE ALSATIAN MINES.

Some time ago one of the leading men in the German potash industry—Herr Wilhelm Sauer—stated that Alsace was not to be feared as a competitor because France would not be able to create an organisation with sufficiently wide views to establish a powerful industry and at the same time to the public interest. Herr Sauer was a bad judge and ill-informed, for that same organisation, the creation of which he believed France incapable, is being methodically built up. Whatever the future constitution of the mines, whoever their future owners may be, one aim must always be kept in view, and that aim is the adoption of liberal ideas both in the administration and in the working of the mines, coupled with co-operation and mutual self-help.

The mines of Alsace lend themselves admirably to compact grouping on a limited area. The small number of working centres, the uniformity of the deposits both in their richness and purity of the salts, the favourable labour and transport conditions, facilitate the establishment and continuity of an understanding between the producers.

For the solution of labour questions a collective contract has been recently concluded with the Miners' Union. It is applicable to the entire potash industry of Alsace and will necessarily have as a consequence the creation of an Employers' Union. With a view to attracting more workers, who will be wanted as the industry increases, it will be necessary to create labour colonies, with which the mines will again have to come to an understanding.

The supply in common of motive power and raw materials, the standardisation of working methods, and the introduction of uniform accountancy principles will create between the various centres of production a solidarity which must strengthen as well as promote the well-being of every mining field.

In conclusion, an industry of such importance requires a centre for research and experiments—a central organisation where directors, engineers, and analysts of the entire district can supply at any moment all the required technical, chemical, and commercial information, and contribute by their labours to that progress which must be achieved if a source of national wealth which victory has given to France is not to be sacrificed.

GERMAN CHEMICAL FACTORIES ON SHORT TIME.

A Frankfort advice states that through the closing down of large chemical works in the neighbourhood of that town, about ten thousand workmen are unemployed. The idleness of these works is important, because of the large deliveries that they have to make to the Entente countries, which would have considerably improved the value of the German mark. The demand for coal in the chemical industry, particularly in the colour factories, compared with other branches of industry is relatively small. Amongst the works so affected are the Höchst Colour Works, the Griesheim-Elektron Chemical Works, and Leopold Cassella and Co., of Frankfort, all of which have been working on a limited scale only, due to coal scarcity, and, as stated above, are now practically idle. The advice deplores the crisis, particularly on the ground that the demand for these companies' goods is very strong at the moment.

* Extracts from an address by Mr. Helmer, Official Receiver of the Alsatian Potash Mines.

THE GERMAN CHEMICAL TRUST.

DETAILS OF WAR-TIME DEVELOPMENTS.

THE special meetings of the German chemical companies forming the great community of interests have approved the proposed extensive increases in the share and preference capital, to which reference was recently made in this journal. The most complete information on the subject was given at the meeting of the Farben Fabriken vorm. Fried. Bayer and Co., by Herr Fried. Bayer, chairman of the company, whose statement is summarised as follows:—

UTILISATION OF ATMOSPHERIC NITROGEN.

The Chairman stated that the Badische Anilin und Soda Fabrik, of Ludwigshafen, with which the Farben Fabriken vorm. F. Bayer and Co. and the A. G. fur Anilin Fabrikation, of Berlin, had in operation a community of interests since the end of 1904, had been occupied for years past with the problem of rendering useful the nitrogen of the atmosphere for the supply of fertilisers to agriculture and of nitric acid for industrial purposes. In the first place, the Ludwigshafen company succeeded in "consuming" the atmospheric nitrogen by the employment of high-pressure electricity in an appropriate manner. This invention was carried out in Norway, but it was not suitable for Germany, as the process was bound up with the availability of large, constant, and cheap water-power.

As a consequence the Baden company in 1908 acquired the process of Professor Haber, which consists in combining atmospheric nitrogen with hydrogen in the form of ammonia by the use of high pressure at a suitable temperature. The problem of improving this process so that ammonia could be produced on a large scale was solved by Professor Bosch, of Ludwigshafen, in such a short time that the first installation was brought into operation in 1913 at Oppau for an annual output of 35,000 tons of sulphate of ammonia. The results of this installation were so encouraging that the Baden company at once decided to extend the plant to a yearly capacity of 150,000 tons of sulphate of ammonia, or 30,000 tons of nitrogen.

THE "FINANCIAL" ASSISTANCE OF THE STATE.

The Chairman then recalled the fact that the imports of Chilean nitrate were stopped through the outbreak of the war. As a consequence the Government repeatedly asked for the execution of extensions of the works during the war. The productive capacity of the Oppau works was doubled and further increased to 100,000 tons of nitrogen. As the safety of the Oppau works became jeopardised by great aerial attacks, the Baden company, at the instance of the Government, undertook the construction in 1916 of a second ammonia works at Merseburg, in Central Germany, for an annual production of 36,000 tons of nitrogen in the first place. During the same year the Government demanded a further extension of the plant up to a capacity of 130,000 tons, and in 1918 a still further expansion of 70,000 tons of nitrogen was called for as being urgently necessary, with which demand the company complied for national reasons. The Government placed at the company's disposal an interest-bearing loan of a definite amount for the carrying out of the extension, and in addition a contribution was made by the Government owing to the increased cost of construction and equipment, particularly in regard to the extensions put in hand in 1918—such contribution to be repaid gradually in the form of deliveries out of the

production of the Merseburg works that were in excess of a definite tonnage of the output.

At present the production of nitrogen by the Baden company, the Chairman proceeded to remark, was prejudicially influenced by the inferiority of the war replacement material (substitutes) at the company's disposal on the one hand, and on the other by the disinclination to work which existed among the workmen and the consequent reduced output of the works. Nevertheless, the company hoped to reach a production of 10,000 tons of nitrogen in the month of November, and steady increase was expected in the coming months, provided that the necessary quantities of coal and coke were available for the purpose. A further expansion of the nitrogen works did not come into consideration within a conceivable period. It was necessary, however, for the Baden company to make provision for the requisite capital needed for the completion of the extensions already in progress and for the lignite mines which served for the supply of the Merseburg works with fuel. The negotiations which had proceeded on the subject between the parties forming the community of interests led to the result that no other way of raising capital was possible than that of again increasing the share capital.

In this connection the firms who had newly joined the community (Hochst, Cassella, Griesheim, and Weilerter-Meer) adopted the attitude that they could only co-operate in the capital expansion if they were permitted to participate in the working results of the nitrogen works to a greater extent than hitherto. The negotiations on the matter led to the removal of the reservations in this respect as from January 1, 1919. It was then resolved that the three largest firms—Ludwigshafen, Hochst, and the Bayer Company—should proceed to double their respective share capitals, whilst the remaining firms should increase their capital in accordance with their profit share in the community. Concerning the price of issue at 107 per cent., it was mentioned that this rate was fixed because a higher premium would have rendered difficult the absorption of the new shares in the home market and caused a large efflux of the shares abroad—which must be hindered as far as possible for national economic reasons. The proposed capital augmentation would cause the influx into the community of a total of 365,000,000 marks, and thus the financial requirements would be covered for a period as far as could be foreseen.

PREFERENCE SHARES AND FOREIGN COMPETITION.

The question of the issue of preference shares was next raised by the chairman. On this point he observed that large coal-tar dyeworks had risen during the war in the important hostile countries in order to render the latter independent of Germany for their requirements in dyes. The German works and sales houses in those countries had been seized and were partly already liquidated or their liquidation was impending. Under these circumstances the Germans would have to build up their foreign business quite from the beginning, and in doing so would have to meet increased foreign competition—which would endeavour to defend itself against German dyes by all possible measures, as, for instance, protective duties, anti-trust, and other laws, propaganda, etc. A firm combination and united action on the part of the community of interests were more necessary than ever in order successfully to meet this trade contest, and the issue of the preference shares, amounting to 40 per cent. of the increased share capital, would draw the interests of the community closer

together and strengthen their competitive capabilities in the world's markets. The preference shares would be inter-changed among the firms forming the community, and would have double voting powers, but would be limited to a dividend of up to $3\frac{1}{2}$ per cent.

THE PRESENT SITUATION.

The Chairman, in conclusion, referred to the course of business as it affected the community of interests in the current year, and stated that it had not been satisfactory. The financial results would be greatly influenced by the difficulties which confronted them in production and sales, by the increased wages and salaries, the indisposition to work, and by the stoppage of the works of some of the firms for months owing to strikes and the scarcity of coal. Nevertheless, the prospect was held out of the distribution of a moderate dividend for 1919, the amount for which, in case of necessity, would have to be transferred from the reserves accumulated in former years for this purpose.

AMOUNT OF CAPITAL INVESTED.

A little further information on the subject was given at the meeting of the A.G. fur Anilin Fabrikation, of Berlin. The chairman mentioned, for instance, that the capital already invested in the Oppau and Merseburg works amounted to several hundred millions of marks. In addition, the State had made contributions of several hundred millions of marks towards the Merseburg works. Besides these sums, the present proposals represented a further capital requirement, so that on the completion of the works the aggregate capital invested in them would exceed 1,000,000,000 marks (pre-war £50,000,000.).

It was stated further that when the works were finished the production would permit of the delivery of nitrogenous products for technical and fertilising purposes to such an extent as to be able substantially to cover the needs of the national chemical and agricultural industries.

REFRACTORY PROPERTIES OF ALUMINOUS PRODUCTS.

H. LE CHATELIER and B. Bogitch have recently completed some tests on bauxite, corindite, and carborundum, having the following analyses—viz:—

	PURE BAUXITE.	Corindite.	Carborundum.
Alumina	58.6	61.4	—
Iron oxide	5.2	5.7	6.1
Silica	29.5	24.0	12.9
Carbon silicide	—	—	79.2
Free carbon	—	3.7	1.8
Titanium	3.8	4.8	—
Not estimated	2.9	0.4	—
	100 %	100 %	100 %

The corindite and the carborundum, when coarsely crushed, left the following residues on the screen:—

	Corin- dite.	Car- borundum.
Residue from 80 meshes to the sq. cm.	24	20
Between 80 and 200 meshes per cm. ²	27	40
Between 200 and 5,000 meshes per sq. cm. .	22	27
Following pass through the screen of 5,000 mesh	27	13
	100	100

The samples investigated were:—

(1) Pure bauxite brick, manufactured industrially, moulded under pressure and baked at 1,300° C. in a large oven.

(2) Corindite agglomerate containing 10 per cent. of crude bauxite.

(3) Corindite agglomerate containing 10 per cent. kaolin.

(4) Corindite agglomerate with 2 per cent. of a syrupy solution of silicate (of soda).

(5) Corindite agglomerate with 6.5 per cent. of syrupy silicate (of soda).

(6) Carborundum agglomerate with 10 per cent. kaolin.

The mixtures for obtaining the blocks contained the quantity of pure water necessary to give a plastic paste; they were then moulded by hand and baked for three hours at 1,200° C. (in the case of corindite) and 1,400° C. (in the case of carborundum).

The crushing strengths in the hot state were measured with a special apparatus which had previously been used for similar tests. The rate at which the load was applied was 0.5kg. per second.

The following tables give the crushing strength in kg. per sq. cm. The values in parentheses refer to material which had become plastic and consequently had no further crushing strength. The figures given thus show the pressure reached at the moment when the sample had been crushed to one-third of its height for the speed of stressing of 0.5kg. per second:—

Sample	20° C.	1000° C.	1200° C.	1300° C.	1400° C.	1500° C.	1600° C.
1 ..	200	180	73	34	18	(12)	(10)
2 ..	43	—	5	—	(2)	—	—
3 ..	55	—	15	9	—	(2)	—
4 ..	35	—	(4)	—	—	—	—
5 ..	41	—	(6)	—	—	—	—
6 ..	143	110	19	(8)	(7)	(6)	(5)

All these products, therefore, became plastic at temperatures ranging between 1,200° and 1,500° C. For this reason they cannot be used in the construction of steel furnace arches, the temperature of which exceeds 1,600° C. Carborundum and alumina, which are perfectly intact at these temperatures, swim in a molten mass, which allows their grains to slide on one another; there is no longer any cohesion in the mass. At the same temperatures silica, although much more fusible, resists perfectly because the crystallisation of the tridymite gives rise to a network, in the centre of which the molten mass lodges without, however, modifying the continuity of the network. Alumina therefore behaves like magnesia; in spite of its infusibility it gives bricks which easily give under pressure when they are hot. It will also be seen that agglomeration with silicate of soda is less advantageous than agglomeration or briquetting with kaolin. Silicate of soda may, however, be used for laboratory furnaces, where the temperature does not exceed 1,400° C., because the walls have no stress to withstand.

The authors were able, by experimenting, to obtain aluminous products which showed a much greater degree of strength when hot than the preceding ones, by taking pure alumina and adding the strict quantity of agglomerant necessary to harden them by baking.

Alumina calcined industrially was used, the following being the final mixtures:—

	Per Cent.	Per Cent.
Alumina	80	90
White bauxite	20	—
Kaolin	—	10
	100	100

These mixtures each contained 95 per cent. of alumina. When first baked they contracted considerably and split in every direction. The material is first calcined at 1,700° C.; it is then crushed into coarse sand, and afterwards rebriquetted with one-quarter of its own weight of the same crude mixture. It is then stamped under pressure and baked at 1,700° C. In this way blocks are obtained which do not commence to soften at even 1,600° C. At this temperature their crushing strength is 20 to 40kg./cm².—*Comptes-rendus*, through *Technical Review*.

BY-PRODUCT COKING.

MR. J. W. PORTEOUS, the President of the Northern Section of the Coke Oven Managers' Association, delivered his presidential address to the members at a general meeting of the Section held at Durham on Saturday.

Mr. Porteous spoke for some time on his early connections with the industry. His first experience of making sulphate was in the early months of 1884, when the open pan salt method was employed. In those days they were rarely troubled, as now, with blue salt, that being conspicuous by its absence. Since then rapid changes and improvements had taken place, and he had looked up some old notes which proved how interesting the developments had been. He would like to take the opportunity of mentioning one who had done a great deal for the by-product industry but whose name he never remembered even seeing in print—he referred to the late Mr. Robert Dixon, of Pease and Partners, one of the pioneers in the movement, who had often proceeded under great difficulties and in spite of a great deal of prejudice.

They had heard a great deal of recent days about the necessity of fuel economy, but it seemed to him very strange that scarcely a word was said about the saving that might be effected in the coke oven industry. Great progress had been made respecting the condensation of gases and the recovery of by-products, but they still appeared to him to go on in a crude and unscientific way regarding the fuel put into the ovens. Little attention was paid to the grading of the fuel or the crushing and washing of it or the draining of it, and it was due to that fact that a great deal of unnecessary waste was taking place. Much valuable fuel was being wasted week by week, and as a result of personal experience he had no hesitation in saying that one of the factors in the wasting of fuel was moisture—moisture was responsible for wasting hundreds of tons of good coking material in Durham county every week. A large amount of gas was required to deal with moisture, which, more often than not, ought not to be there. He was convinced that a large amount of condensing trouble was due to the excessive amount of water present.

Another point in connection with water trouble in plants where condensing facilities were limited was that as the water began to run to the seal pot it naturally took up a certain amount of ammonia. On plants where coal with a large percentage of moisture was used there were more naphthalene troubles than where dry coal was used. Moisture up to 9 per cent undoubtedly improved the yield of ammonia—it helped to protect it in the oven,—but when above 9 per cent. he thought he was on sound ground in saying that the yield of ammonia had a tendency to fall. Too large a percentage of water also affected the coke yield. He considered there were cases where 2 per cent of coke had been lost through the stamping of the fuel. Owing to the repressed character of the cells and the steam being converted the oxygen came into contact with the carbon, formed water-gas, and the yield was decreased. There were those who held that the gas issuing from the coking charge passed up the centre of the charge, but he thought it passed through the already incandescent mass. Not only had they condenser trouble owing to the over-percentage of water, but it destroyed much fuel that would otherwise get to the blast-furnaces.

Another great enemy of the coke oven manager was the question of ash, and he professed a great deal of sympathy with blast-furnace managers, who complained of the ash trouble in the coke sent to them. He did not agree that the usual laboratory figures giving ash percentages could be taken as really correct. Ash was injurious to the yield of ammonia not only because of the certain position it occupied in the oven instead of clean coal, but also from the fact that when the ash contained a certain amount of iron in an oxidised state or even as pyrites the iron acted upon the already formed ammonia, and by catalytic action at certain temperatures—say 600° and upwards—destroyed a large amount of ammonia already formed when it came into contact with it. He suggested that when the yield of ammonia fell in a manner unaccounted for after the usual examinations of the plant had been made, a further investigation in respect to the iron content of the ash would result in solving the problem to a large extent.

DISCUSSION.

Dr. Lishman said it was the first time he had heard it said that the results from a compressed charge were less than from a non-compressed charge.

Mr. G. A. Phillipson agreed that tar acids kept naphthalene in suspension—a point which was not generally understood. He was inclined to think that Mr. Porteous' references to temperatures of ovens were on the high side. The question of ash was one which certainly needed ventilating, and although he knew nothing of the catalytic action of the iron, he thought the president had stretched the point of its interference with the ammonia yield. If his ammonia yield went down he would be inclined to look to the flues for leakages and to investigate those subtle effects of draughts.

Mr. A. H. Middleton thought the "pernicious system" of using coke ovens as boilers was a system upon which much could be said and one which should receive a great deal of attention in future discussions. He agreed that the ash question was a very grave one. The effect at the blast-furnaces was much more serious than was generally realised.

Mr. Porteous, referring to Dr. Lishman's remark, said that he had a serious experience in the matter, and was convinced of the truth of his attitude. In reply to Mr. Phillipson's criticism of the figures given regarding temperatures of ovens he stood by them and quoted the late Mr. Cooper on the subject and several American writers. He repeated that he firmly believed that iron existing in coal above a certain percentage had a direct influence on the ammonia yield.

ELIMINATION OF WASTEFUL EFFORT IN INDUSTRY.

PROFESSOR T. H. PEAR, M.A., B.Sc., read a paper on this subject at a meeting of the Manchester Literary and Philosophical Society last week.

The lecturer pointed out that, it being impossible to distinguish sharply between physical and mental effort, in the investigation of the problems of economising human energy physiology and psychology must work side by side. While in many industries improvement of the external conditions of work, such as temperature, ventilation, humidity, illumination, was rapidly proceeding, less had been attempted in the direction of improving the methods of work themselves. Examples of such efforts illustrated the importance of certain fundamental principles. The first was the adjustment, both in total length and in distribution, of rest pauses. By introducing suitably chosen rest pauses and by modifying the working attitude of girls who were engaged in folding handkerchiefs, the output increased 300 per cent., while the folders worked only 45 minutes in each hour and were less fatigued than before. The second principle

was the substitution of habitual movements for constant acts of decision. By rearranging the method of "assembling" a braid machine, so that the parts were not only put together in a more efficient order but were more easily found by the workman, 66 units were assembled by a man in one day instead of 18. The third was the elimination of useless movement. By this means the separate actions required to lay a brick had been reduced from 18 to 5; the output increased from 120 per man per hour to 350.

Insistence was laid upon the importance of teaching the best methods of work first, before the worker had acquired less efficient methods which were difficult to unlearn, and upon the necessity of such training being carried out by persons who knew how to teach. By analysing the results of motion study in a British munition factory during the war and similar improvements elsewhere, it was shown that "speeding up," fatigue, and the exploitation of the worker are by no means necessary results of such modifications. The question of the monotony alleged to be caused by such "shorthand" methods of work was also discussed. The fundamental confusion between the terms "monotonous" and "habitual" was emphasised, and means were described by which the more efficient methods may increase interest in life both directly through their own nature and indirectly through the increased leisure, husbanding of energy, and higher wages which they make possible.

In the discussion which followed, Dr. William Cramp, M.I.E.E., pointed out the dehumanising tendencies of experiments designed to achieve maximum output, and questioned the desirability of extreme specialisation from the point of view of the development of the individual. He suggested also that it was better to encourage individuals by lectures such as those of Professor Pear to take a pride in finding their own most efficient methods than to attempt to force upon them methods similarly deduced by the management.

Mr. Ernest F. Lange, Mr. H. J. Woodall, and Professor F. E. Weiss also contributed to the discussion.

EVAPORATION AND FUEL ECONOMY.

THE first of two lectures on "Evaporation" was delivered by Mr. H. J. Pooley at the Manchester College of Technology on Tuesday last. Mr. Pooley emphasised the importance of evaporation in chemical works practice and the increasingly important part which it would be called upon to play in the near future by reason of the high prices which manufacturers were compelled to pay for fuel. It was natural, therefore, to expect that the question of economy in the use of fuel would become a very practical one, and in evaporating operations steps would be taken to ensure that the greatest possible efficiency was being derived from the plant and the fuel employed. Dealing with the features that were very desirable in an evaporating plant, the lecturer enumerated these as the rapid passage of steam from the evaporator, the efficient circulation of the heated liquor over the heating surfaces, the free escape of steam, freedom from entrainment as far as practicable, accessibility of the plant for cleaning and repairing purposes, and sufficient vapour pipe allowances. The leading types of English and American evaporating plant were referred to. The lecturer expressed the opinion that the vertical type of evaporator, having the liquor under treatment inside the tubes, was the only type of evaporating plant that would survive.

SOIL BACTERIA.

AT the Chemical Industry Club, Newcastle, last week, the second of a series of meetings under the Technical Section was held under the presidency of Mr. O. Smalley. A paper on "Soil Bacteria" was read by Mr. F. H. Walker, B.Sc., A.I.C.

Mr. Walker commenced with a short resumé of the progress of agricultural chemistry up to about 1860, when it almost came to a standstill, when the theories of Leibig on the mineral constituents absorbed by plants from manures had been found to be only partially true. Leibig, as they knew, maintained that ammonia and not gaseous nitrogen was taken up by plants. After a great controversy, the experiments of Lawes, Gilbert, and Pugh proved that all non-leguminous crops thrived when treated under proper conditions with nitrogenous fertilisers and died when deprived entirely of combined nitrogen, despite the other mineral constituents being present. It was found that peas and clover could thrive without nitrogenous manure and the soil in which they grew actually became richer in nitrogen, and the amount brought down by rain failed to account for it at all. Thanks to Pasteur, the science of bacteriology made rapid progress. Pasteur appeared to have recognised that the change of ammonia to nitrate in soil was a bacterial process.

In 1887 Schloesing and Muntz remarked that when a stream of sewage was allowed to trickle down a column after a lapse of 20 days the ammonia in the sewage began to convert to nitrate and finally was completely converted. The process of conversion was stopped by adding an antiseptic and could be re-started by an addition of turbid water extract of dry soil. The "nitrification" was due to bacteria. Later experiments showed that nitrification took place in two stages and that there were two organisms. Beijerinck eventually isolated *B. radicola*, and the conclusion was generally accepted that bacteria are the real makers of plant food in the soil.

After discussing the value of farmyard manure from a bacterial standpoint, Mr. Walker stated that he considered that acidity in soils might be caused by the prolonged use of sulphate of ammonia when not properly corrected by lime. In rich soils the bacteria might be greatly reduced in number by protozoa. *B. radicola* could not live in acid soils or in land rich in nitrates, and Bottomley had finally selected peat as a suitable material for distribution. Raw peat was treated with steam and afterwards inoculated with a mixed culture of *B. radicola* and *azobacter chroococcium*, and remarkable successes were obtained. He described many of the experiments of Bottomley and Rosenheim at this stage of the paper. The attempt to put bacterised peat on the market as humogen had not been altogether successful. He described in detail many experiments which had been carried out with success in producing increased yields of crops.

A long and informal discussion took place, to which the Chairman and Messrs. H. Dunford Smith, G. Weyman, W. D. Jones, J. T. Carr, and C. S. Haddon contributed some remarks.

Mr. Walker, replying to the discussion, said that soil inoculation would not make up for bad cultivation or the shortage of certain mineral constituents. The weather had an enormous influence, and many of his own experiments had been inconclusive owing to the excessive drought. The bacterised peat could be used either with or without stable manure.

SOCIETY OF CHEMICAL INDUSTRY.

NEWCASTLE SECTION.

A GENERAL meeting of the Newcastle Section of the Society of Chemical Industry was held in the Armstrong College, Newcastle, on Wednesday (November 19), under the presidency of Professor P. P. Bedson, when a paper by Mr. N. N. Sen Gupta, B.Sc., was communicated by Mr. S. H. Collins, M.Sc., F.I.C. The paper was on

"THE GENERATION OF HYDROCYANIC ACID AND THE PROPERTIES OF THE FAT FROM THE SEEDS OF THE 'SCHLEICHERA TRIJUGA,' AN INDIAN FOREST TREE."

Mr. Collins explained that the thesis was elaborated by the author whilst a student at the College, and for which he had gained his degree. He (Mr. Collins) had met Indian forest experts who confirmed the statement that the tree grew in large numbers in all parts of India. He did not see why a new industry should not be built up upon the information given by Mr. Sen Gupta in the paper. The information was invaluable to any manufacturer who proposed utilising a material of properties at present virtually unknown.

Schleichera Trijuga, according to the paper, was a large deciduous tree distributed over an area of considerable variations in temperature. It was met in all dry forests throughout India, Burmah, and the Indian Archipelago. It had been known for some time that the seed of the tree was cyanogenetic. The work embodied in the paper fell under three heads: (1) A general survey of the constituents of the various parts of the fruit from the feeding point of view; (2) a study of cyanogenesis in the seed; (3) examination of the fat. Mr. Sen Gupta dealt chiefly with the second head, owing to its special scientific interest and the bearing on the extent to which the fatty and non-fatty elements of the seed might be used as articles of commerce in view of the extreme toxicity of the HCN which, in the absence of suitable precautions, might be present as such in the fat or locked up in the parent substance in the residue and capable of being liberated under favourable conditions. The most obvious feature of the normal, healthy seed was its excessively high fat content, as a result of which a mill refused to pulverise it, and the cracking of nuts revealed a liability to attack of fungi, giving rise to spores and mycelia. Roughly speaking, 70 per cent. of the fruits at his disposal were in some way affected by fungi, although the damage to the seed was not a constant consequence.

Regarding the analysis of healthy seeds, it was noted that the percentage of HCN yielded by the seed under favourable conditions of hydrolysis had been 0.574 per cent., which corresponded to 0.298 per cent of nitrogen. The probable composition of cake from expressed seeds he gave as: Moisture, 8.28; oil, 14.99; albuminoids, 47.07; carbohydrates, 15.88; fibre, 8.79; ash, 4.99. Dealing with the question of hydrolysis, he considered it was hardly conceivable that HCN could be present in the seed in a pre-formed state. The hydrolysis under quite different conditions was quite typical of enzyme activity. At least two products of hydrolysis had been detected—namely, HCN and dextrose, which had been qualitatively examined. No clue had been obtained as to other products of hydrolysis, if any.

Mr. Sen Gupta described the experiments and apparatus used for determining the evolution of HCN under different conditions of hydrolysis by colorimetric

and volumetric estimation. In the section dealing with the effects of thermal conditions he had discovered that a temperature of 25° C. was more favourable for the activity of the enzyme present than that of 45° C. Even at 90° C. the action was by no means nil, but it spread over a short period of time, the enzyme activity stopping altogether within 45 minutes of the commencement of the experiment.

Coming to the more practical aspect of the question of inhibition due to wet heat, observations were made on the effect of steam blown through ground material. The result of a rather elaborate experiment was that the subsequent examination of the steam-treated material failed to detect the minutest trace of HCN. It was evident that the evolution of HCN in that case was a matter of a few minutes before the steam had its full effect, and that the steam carried away what little HCN was generated, leaving the material perfectly innocuous. Experiments on whole seeds were equally satisfactory. So far as the effect of dry heat was concerned, the power of the enzyme to resist the effect of dry heat was very considerable. Similar treatments for longer periods, however, showed that dry heat, though slower in action, eventually overpowered the enzyme, and the ultimate defeat of the enzyme was full of meaning; and it would be well to remember the claims of dry heat for its simplicity and practicability.

The extent to which ether checked the activity of the enzyme was remarkable. Quantities of the ground material, varying from 2 to 3 gm., were percolated with redistilled ether for different lengths of time, and the extracted material, freed from ether by exposure, was then examined in the usual way at 35° C. and 25° C. The results in all cases were highly satisfactory, the evolution of HCN being either nil or so low as to be hardly measurable in view of the comparatively large quantities of the material used. The extracted material on keeping became still more innocuous; 3gm. of material extracted for 2½ hours and then exposed to the atmosphere for a period of 12 days failed to evolve any HCN. As the body temperature of livestock could be, roughly, taken as 39° C., it was obvious that such ether-extracted material would be quite safe for feeding purposes.

As to the effect of petroleum ether on enzyme, the results of two experiments, although not scrupulously concordant, demonstrated clearly that petroleum ether possessed an inhibitory power which demanded serious consideration on account of the cheapness of the solvent and its extensive use for the extraction of fats and oils. Carbon di-sulphide was very effective in checking the activity of the enzyme, as was also carbon tetrachloride. An experiment with ethyl alcohol on enzyme showed that for four hours' examination not the slightest evolution of HCN was detected. An experiment with H₂O₂ showed that the compound was by no means without effect on the enzyme, but the effect of chloride of lime had fallen far short of anticipation. One gramme of material, which must have lost a certain amount of HCN by being kept ground for two days before the experiment, yielded as much as 1.56 mgm. of HCN when 50 mgm. of chloride of lime was used in the hydrolysis medium.

A few experiments had been carried out to determine the influence of a number of commonly employed cattle foods, such as grass, hay, silage, and roots. In accordance with the custom of feeding, one or more of such foods would be admitted into the animal system simultaneously with the cake or meal derived from the

seed under discussion, and thus the enzyme, if not already destroyed in manufacture, would have to act in such foreign elements. The proportions of ground seed were determined with regard to rations in vogue. The object of the experiments was to show how much prussic acid could be generated under ordinary conditions of feeding if the enzyme and glucoside came into full play in the feeding stuff admitted to the rumen. The evolution of HCN was greatest in the presence of silage, and least with grass, hay and roots occupying the intermediate positions in the order of the amount of HCN evolved. Silage increased the activity of the enzyme by more than 100 per cent., and hay by 33 per cent.; in the presence of roots the evolution was slightly higher than normal.

The remainder of the paper gave detailed illustrations of a series of experiments which showed that a reducing sugar (probably dextrose) was found to be one of the products of hydrolysis, and had been estimated in several cases to indicate 1 HCN : $3\frac{1}{2}$ dextrose. The enzyme was extremely difficult of isolation in a potent state, decomposing very quickly outside the seed. It had been found to hydrolyse amygdalin, besides the glucosides contained in the seed. It was reasonable to conclude that there was an emulsion-like body in the seed. The cyanogenetic material in the seed appeared to be a mixture of at least two glucosides, of which the principal one might prove to be a glucoside hitherto unisolated. A small proportion of amygdalin was associated with the seed.

Dealing with the fat of the seed, it was pointed out that Lewkowitsch and others had already dealt with that aspect, though not with the cyanogenesis. The seed contained as much as 67 per cent. of fat, a percentage which almost constituted a record in the vegetable kingdom. The fat was known as kon oil, kusum oil, macassar oil, etc., the last of which had a large currency in commerce. The freshly-extracted material was a solid which liquefied at a comparatively low temperature, possessed a pleasant smell, and was a yellowish-white colour which changed to brown with heating. The specific gravity was 0.86. The fat melted at 21°C . Three saponification values had been obtained—229.1, 214.44, and 207.57. The result of examination for iodine values on the same three samples resulted in 52.4, 55, and 54.6 respectively. The acid value varied with the source of the fat. It was lowest in the fat obtained from healthy seeds, and intermediate in the fat extracted from healthy and diseased seeds mixed. The freshly-extracted fat from healthy seeds gave an acid value of 13.06, although a similar sample allowed to stand for three months had an acid value of 16.28. The fat extracted from diseased seeds alone indicated the enormous acid value of 109.6, whilst mixed seeds gave 75.4.

DISCUSSION.

Professor P. P. Bedson congratulated the author of the paper, and thanked Mr. Collins for so ably presenting it. He asked whether Mr. Sen Gupta had tried the effect of other solvents, such as di-chlor-ethylene, or solvents of that kind, which he understood were used in industry for the extraction of fat from seeds.

Mr. Collins replied that the solvent mentioned by Professor Bedson was not employed. Having tried petroleum ether, he did not think the results would be dissimilar.

Mr. A. Short said that the paper was rather far removed from the ordinary work of the industrial chemist. At first sight it seemed rather startling to learn that foodstuffs could generate prussic acid. He would like to ask whether any cases had happened where death had been caused by lack of treatment or through wrong treatment of foodstuffs.

Mr. Collins replied that the question of the development of prussic acid in foodstuffs was one of those questions which

cropped up periodically just when everyone had comfortably forgotten all about it. There had been a number of cases of calves being poisoned by prussic acid developing in foodstuffs, and a certain, though much lower, number of cases of cows also. There were one or two cases of calves every year, and of cows every five years or so. So far as other animals were concerned the deaths had not been noted, probably due to the less expense involved in the loss of a sheep, for instance. It was practically safe, he concluded, when the meals were prepared by the farmers rather than by manufacturers. Inexperienced persons about a farm occasionally were responsible for disastrous results in feeding. When cattle food was boiled, or even soaked in boiling water, the enzyme was completely destroyed. If the foods were carefully mixed little harm would accrue. The enzymes were so sensitive that they were upset by almost anything. He was of opinion that a new cake put upon the market without a guarantee of freedom from the possibility of developing prussic acid would have little success—farmers would not be inclined to buy. The value of the experiments outlined was, therefore, incalculable. In answer to a further question by Mr. Short, Mr. Collins said the ordinary solvent used for the extraction of oil was petroleum spirit with a low boiling-point.

ANNUAL MEETING OF THE SOCIETY.

Professor P. P. Bedson, chairman of the Newcastle Section, said that the Committee had recommended the members to invite the Society of Chemical Industry to hold its next annual meeting in Newcastle. A similar invitation had been extended to the Society last year, but other arrangements had already been concluded. The annual meeting has already been held in Newcastle—in 1884, 1899, and 1908. He formally moved the resolution, which was seconded by Mr. S. H. Collins, M.Sc., and carried unanimously.

A party of 45 members of the Newcastle Section of the Society of Chemical Industry on Saturday paid a visit to the Elswick works of the Newcastle and Gateshead Gas Company, where a most enjoyable afternoon was spent. The party had as guides Mr. T. Hardie, the company's engineer; Mr. Atkinson, manager of the Elswick department; Mr. G. Weyman, chief chemist; Miss Wallace, and Messrs. Hoovey, Kimpson, Cumming, and Walker.

AMMONIC-POTASSIC NITRATE.

SINCE 1917, according to the Bulletin of the International Institute of Agriculture, experiments have been made in Germany on small plots, in the use, as a fertiliser for beets, of ammonic-potassic nitrate, manufactured by the Badische Anilin- und Sodafabrik by treatment and double decomposition of ammonium nitrate with potassium chloride. The fertiliser, also known as "mixed salt" ("Mischsalz"), is granular, brownish-grey, spreads easily, and contains 13 per cent. of nitrogen, 25 per cent. of potassium, 3 to 4 per cent. of water, and 27 to 30 per cent. of chlorine. This compound may be safely used as a fertiliser. It is preferable to ammonium sulphate, as it spreads more evenly, absorbs less moisture, and is less explosive. Experiments made by Professor Schneidewind on beets in the sandy loam of the Lauchstädt Experiment Station, showed the value of the new fertiliser to be exactly equal to an equivalent quantity of sodium nitrate. The makers also intend putting on the market ammonic-sodium nitrate. The ammonium chloride put on the German market in 1918 contains from 23 to 25 per cent. of nitrogen, and is as satisfactory as ammonium sulphate. It should, however, be used with care when added to plants sensitive to chlorine.

SODIUM AND SODIUM COMPOUNDS IN THE UNITED STATES.

THE manufacture of sodium and sodium compounds in the United States, and the position of the industry in 1918, are reviewed in a report issued by the Geological Survey of that country. The rule of the Department that the production of any single mineral or compound shall not be disclosed unless there are at least three producers of it or special permission is obtained, has necessitated reporting the production of some compounds in the following table in groups. The table summarises the reported production of sodium and sodium compounds in 1918, and gives for comparison such figures as are available for 1917.

PRODUCTION.

SODIUM AND SODIUM COMPOUNDS PRODUCED IN THE UNITED STATES IN 1917 AND 1918.

	1917.		1918.	
	Quantity (short tons).	Value.	Quantity (short tons).	Value.
Sodium (metal)	(a)	(a)	264	\$153,437

Rock salt	1,605,025	3,897,595	1,683,941	5,684,661
Evaporated salt	2,482,564	14,959,261	2,724,203	20,010,435
Sodium cyanide, sodium iodide, and sodium peroxide	9,694	6,133,000	9,086	5,427,240
Sodium ferrocyanide	4,173	2,577,667	4,525	2,690,110
Sodium fluoride, acid sodium fluoride, and sodium fluosilicate (silicofluoride)	1,424	397,305	1,228	281,264
Sodium hydroxide (caustic soda)	188,056	29,402,689	513,363	31,854,470
Sodium nitrite	861	480,145	1,701	609,779
Sodium phosphate (including all sodium phosphates)	13,305	711,283	15,620	1,427,947
Sodium silicate	254,011	3,317,547	317,161	5,870,973
Sodium sulphate:				
Salt cake	183,909	2,987,641	141,054	2,844,897
Glauber's salt	47,757	732,403	50,715	1,041,070
Nitro cake	387,821	780,278	143,155	595,660
Sodium sulphide	49,494	1,905,473	43,490	2,293,304
Sodium tetraborate (borax)	32,089	4,717,532	26,673	3,909,565
Sodium thiosulphate (hypo-sulphite)	26,598	717,924	26,868	1,051,623
Miscellaneous sodium compounds	4,563	2,062,300	381	1,122,552
	10,164,825	132,787,578	10,198,842	142,682,575

(a) Included in miscellaneous compounds.

The production given in the above table is practically identical with sales for most of the salts. This is especially true of soda ash, as the soda ash used by manufacturers in making caustic soda in their own plants is not included in the figures above. On the other hand, however, the caustic soda made and consumed in their own plants by paper manufacturers and others is in-

SODIUM COMPOUNDS USED BY THE MAKERS IN THEIR OWN PLANTS IN 1918.

	Quantity (short tons).	Value.
Soda ash	664,119	\$13,627,000
Sodium acetate	2,236	549,085
Sodium bichromate	3,227	812,310
Sodium fluosilicate	87	12,975
Sodium hydroxide	79,207	5,077,891
Sodium silicate	56,696	1,076,621
Sodium sulphate:		
Glauber's salt	7,001	138,820
Nitro cake	39,906	253,672
Salt cake	9,903	207,080

SODIUM SALTS DERIVED FROM NATURAL SOURCES IN 1917 AND 1918.

	1917.		1918.	
	Quantity (short tons).	Value.	Quantity (short tons).	Value.
Sodium chloride:				
Salt in brine	2,890,588	\$1,083,586	2,830,600	\$1,245,265
Rock salt	1,605,025	3,897,595	1,683,941	5,684,661
Evaporated salt	2,482,564	14,959,261	2,724,203	20,010,435
Sodium carbonate, sodium bicarbonate and sodium sulphate	21,743	895,602	24,053	992,788
	6,993,920	20,836,044	7,262,797	27,933,149

cluded, as well as small quantities of certain other salts listed below, such as sodium bichromate, saltcake, and nitre cake, consumed by the makers. A large quantity of nitre cake is neither sold nor consumed, but represents a waste product.

IMPORTS.

Sodium nitrate is the principal sodium salt imported. The imports of most of the other salts are very small compared to the domestic production, according to the records of the Bureau of Foreign and Domestic Commerce, which furnishes the data on imports and exports.

SODIUM SALTS IMPORTED FOR DOMESTIC CONSUMPTION IN 1917 AND 1918.

Sodium carbonate:				
Soda ash	649,210	62,884,569	119,217	\$7,805,550
Sal soda	63,718	697,772	6,358	213,865
Sodium chloride (common salt) ..	113,993	1,000,773	136,783	1,677,577
Sodium hydroxide (caustic soda) ..	644,997	65,832,598	48,689	5,602,813
Sodium silicate	67,275	6216,828	14,125	404,796
All other salts of sodium	—	64,030,196	—	6,587,134
	—	23,384,969	—	22,291,735

a Six months, January-June.

b Six months, July-December.

The domestic exports of sodium salts in 1918, \$22,291,735, were thus only slightly less than those in 1917, \$23,384,969, which were the largest ever recorded.

SODIUM COMPOUNDS IN RELATION TO THE WAR.

The war not only stimulated the chemical industry in the United States to produce sodium compounds that were formerly imported and to supply them to foreign countries, but, on account of the high cost of potash, brought about the replacement, either wholly or in part, of potassium compounds by sodium compounds in the manufacture of glass, soap, and matches, in photography, in medicine, in tanning, and in the manufacture of cyanide for extracting the precious metals from their ores. The need of chlorine for war purposes led to an increased production of caustic soda, which was itself in demand for making phenol used in making the picrates.

From August 1 to November, 1918, the exportation of caustic soda was under Government control through licence. About the time the armistice was signed the prices of nearly all sodium compounds, which were then greatly advanced over pre-war prices, began to fall, and the decline continued well into 1919, leaving the producers in a very uncertain position with regard to possible tariff changes, foreign competition, and domestic demand.

Operation of the Government plant at Edgewood, Md., for making caustic soda and chlorine was discontinued in November, 1918. Most of the caustic soda made in this plant was used in the form of a dilute solution for absorbing residual obnoxious gases incidental to the production of the "war gases."

Although the present prices of many sodium compounds do not compare favourably with those of corresponding potassium compounds before the war, it is practically certain that pre-war prices for potassium compounds will not be again reached for a long time, so that the greater part of the substitutions that have occurred will be permanent. It may be noted that if the costs of production of sodium salts are equal to those of the corresponding salts of potassium per molecule the sodium salts have a slight advantage in lightness and hence in freight rates, as the atomic weights are 23 and 39 respectively.

The demonstrated inventiveness of the chemists and producers of the United States, says the report, indicates that foreign competitors will not easily regain their former position in that country. Moreover, with one or two exceptions, raw materials are abundant in the United States, so that foreign competition will always have the handicap of the long ocean haul, although this may be cheaper than a long land haul. Obviously, however, a certain amount of international exchange is desirable, and it may be noted that although both imports and exports have increased in recent years, the increase in imports has been due largely to sodium nitrate, whereas that in exports has been due to a considerable variety of manufactured compounds.

The principal producers of alkali in the United States have organised an export association under the laws of the State of Delaware, with offices at 171, Madison Avenue, New York City. The object of the association is to work for uniform and favourable conditions in the export business, with special regard to foreign banking facilities and to ocean freight rates.

AMERICAN SMELTING AND REFINING COMPANY.—Dividend of 1 per cent. (\$1. per share) on the common stock for the past quarter.

CORNISH TIN AND WOLFRAM.

THE Committee appointed by the Board of Trade to inquire into the non-ferrous mining in the United Kingdom has held several meetings under the chairmanship of Mr. H. B. Betterton, M.P., and has examined a number of witnesses.

Mr. A. F. Maclaren, the chairman of St. Ives Mines, Limited, said that the Giew Mine is the only mine now working in St. Ives district, and this is working at a loss. The mine lost a large proportion of its men at the beginning of the war by the calling up of naval reservists, and insufficient development work was done in consequence; this is retarding operations now. He thought that the Giew Mine and its immediate neighbours could be equipped for work on a sufficient scale for an expenditure of £40,000., and that a profit could then be made if the price of metallic tin were not less than £220. a ton. He estimated that it would require £180,000. to restart the St. Ives Consols group, and thought it would not be possible at this time to raise the money required for such purposes by the usual means.

Mr. E. Terrell gave evidence respecting Wheal Jewell, Wheal Friendship, and Hemerdon Mine. Underground working at Wheal Jewell was suspended in 1916 owing to the scarcity of labour. He was convinced from the yields of tin and arsenic obtained during development that the mine was a sound commercial proposition under ordinary economic conditions, but the present outlook was speculative and not encouraging. The Hemerdon Mines, Limited, opened a large area to supply the war demand for wolfram. Small quantities of wolfram have been produced, and working results have been very promising. By January, 1919, a plant capable of dealing with large quantities of material had been completed at a cost of £75,000., but the heavy drop in the price of wolfram caused the closing of the mine in April. The directors would not be justified in resuming operations under present conditions with a price for wolfram below 55s. per unit.

Mr. Oliver Wethered, vice-chairman of the Cornish Chamber of Mines, vice-chairman of Dolcoath Mine, Limited, and chairman of the Geevor Tin Mines, Limited, explained the present position and prospects of the Dolcoath, Killifreth, Porkellis, and Geevor Mines in Cornwall, and gave his views as to the future of the Nigerian tin industry. He thought that all the available evidence supported the view that the production of the known tin fields of the world could not expand to meet the inevitable increase in demand for the metal, and was of opinion that high prices for tin would probably rule for some time to come. With regard to Cornwall, he thought there were possibilities of large and profitable production at the prices to which he anticipated tin would go, and suggested a loan at a low rate of interest, with repayment deferred for at least 25 years.

Mr. J. H. Bennetts (Workers' Union) and Mr. W. Hosking, Mr. H. Hosking, Mr. W. Richards, and Mr. J. Nankervis (Dock, Wharf, Riverside, and General Workers' Union) thought that State aid was necessary to enable the Cornish tin mines to carry out developments, and, in some instances, to install modern machinery to increase production. The workers should have the first claim on any prosperity resulting from Government assistance.

ITEMS OF INTEREST.

DYE EXPORTS FROM LEEDS.—Dyestuffs amounting to £2,308. were exported from Leeds to America during the quarter ended September 30 last. None was exported in the corresponding period last year.

REPORTED BRITISH PURCHASE OF GERMAN CHEMICAL WORKS.—A German wireless message says that British financial organisations are negotiating for the purchase of large Siebenburg industrial enterprises. A large soda factory and two leather factories there have already passed into British hands.

PRESENTATION.—Mr. Joseph Watson, the former well-known Leeds soap manufacturer, and Mr. L. C. Paget, a director of the Olympia Oil Works at Selby (Yorks.), both of whom have severed their connection with the last-named works, have been the recipients from the Selby employees of pieces of silver-plate.

BUSINESS NOTICE.—The capital of the Lawrence Chemical Company Ltd., St. Dunstan's Buildings, London, E.C. 3., has been increased to £20,000., consisting of 40,000 ordinary shares of 1s. each, and 18,000 cumulative 6 per cent preference shares of £1. each. The whole of the capital is fully subscribed for cash.

POLAND AND PATENTS CONVENTION.—The new State of Poland has acceded to the International Convention governing the mutual protection of inventions, designs, and trade marks in the signatory States, and an Order in Council, taking effect from November 20, therefore makes section 91 of the Patents and Designs Act, 1907, applicable to Poland.

ZINC AND ZINC DUST PRICES.—The price of Australian high-grade zinc dust (88–92% metallic zinc) is maintained at £75. per ton, with but little stock offering for prompt supply. The price of Australian electrolytic zinc (99.95% purity) has been increased to £44. per ton, f.o.b. Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

TANNING EXTRACT MANUFACTURE AT RUNCORN.—New works are being established at Runcorn, Messrs. Malcolm, of Glasgow, having purchased an old ropery belonging to the Manchester Ship Canal to convert into a tanning extract works. The firm anticipate a market with the big local tanneries. It is expected that a considerable number of men will be employed.

WAGES ADVANCES FOR SOAP WORKERS.—At a mass meeting of Messrs. Lever Bros.' soap workers, on Monday, Mr. Robinson, the general secretary of the National Warehousemen's Union, announced important advances for workers in the soap and candle trades throughout the whole country. He said a conference of workers and members of the Industrial Council had agreed, subject to ratification, that all males should receive a 5s. advance and females under 18, 2s. 6d. When all payments were consolidated, the wages for adults would be £3 10s. per week. This also included clerical staffs. Shift workers they hoped to increase twopence per hour. They were not opposed to co-partnership, but wanted the co-partnership to give the fullest benefits to their members. He asked them to back up their officials, and cease working with non-unionists at the end of the year. A resolution to this effect was unanimously passed, and the terms of the wages settlement agreed to, subject to acceptance by the Trade Industrial Council.

GERMAN CEMENT INDUSTRY.—The vital interests of the German cement industry are bound up in the coal and transport problems of to-day, and the capacity of production is dependent upon these two important factors. About half of the factories are closed down on account of coal shortage. In peace time, when one could rely on the quality of coal, the cement industry calculated on a 50 per cent. consumption of coal in production in a well-run concern. To-day one must calculate on a 60-65 per cent. consumption of coal. With the 75,000 tons of coal which were available from September 1, one can reckon, taking a basis of 50 per cent., that under the most optimistic circumstances 150,000 tons of cement per month at the most can be produced to meet a monthly demand of, roughly, 1,000,000 tons. The production is divided among the three Unions of the German Cement Union—namely, the North German, the Rhine-Westphalian, and the South German,—so that about half falls to the North German Union and a quarter to each of the remaining two Unions. There are no particular difficulties in the labour question in the cement industry, although the available labour cannot be fully employed owing to the limited output of cement.

EXPLOSIVES PERMITTED LIST.—A Home Office announcement explains the effect of "the Explosives in Coal Mines Order of November 14, 1919," which comes into force on January 1, 1920. The Order revises the permitted list of explosives by omitting from the list those which are not being manufactured at the present time, and consolidates the remainder in one complete list by substituting the schedules attached to the new Order for those attached to the old Order of September 1, 1913, and its amending Orders.

SYNTHETIC DAYLIGHT.—Synthetic daylight is the invention of Mr. G. Sheringham, and as developed by Mr. L. G. Martin (Imperial College of Science) and Major A. Klein, was explained on Tuesday, by Mr. Martin at a Royal Society of Arts meeting in London. Great commercial possibilities are said to lie in its development, for among its other advantages it renders possible an exact matching of colours when daylight has faded from the sky. The apparatus exhibited is simple; and it is possible to obtain results with an electric lamp of 300 candle power. Below the bulb an opaque reflector is fitted in such a way that the rays are projected upwards against a screen of various colours arranged in small patches according to a formula. The light which falls back from the screen presents any coloured material in its daylight hue.

ALCOHOL AS MOTOR FUEL.—Some figures relating to the use of alcohol and other fuels in motor vehicles were given by Dr. T. Blackwood Murray in the course of his address as President of the Institution of Engineers and Shipbuilders in Scotland. In France, some years ago, a mixture of 50 per cent. alcohol, 35 per cent. benzole, and 15 per cent. petrol was tried in comparison with pure benzole and pure petrol. The results showed that 46.3 gross ton-miles were obtained per gallon of alcohol mixture; while for petrol and benzole the corresponding figures were 53.2 and 57.1 respectively. He is confident that denatured alcohol could be delivered to the consumer at a figure at which, taking the current prices of petrol and benzole as 3s. 0½d. and 2s. 9d. per gallon respectively, the cost per ton-mile would be 0.53d. for alcohol mixture, 0.578d. for benzole, and 0.686d. for petrol.

NEW ISSUES.—The directors of Bell's United Asbestos Co. Ltd., announce an issue of 110,000 ordinary shares of £1. each, thereby increasing the issued ordinary share capital from £140,000. to £250,000.—An increase from £5,000,000. to £20,000,000 is to be made in the capital of the Anglo-Persian Oil Company. In this connection there is to be an issue of new capital amounting to £8,600,000. in the near future. The issue will comprise £3,000,000 ordinary shares, to be taken up by the existing ordinary shareholders, £3,000,000. 6 per cent preference shares and £2,600,000. 5 per cent. debenture stock.—Jurgens, Ltd., whose authorised capital is £10,000,000., invite applications for 1,500,000 7 per cent. cumulative participating preference shares of £1. each at 21s. per share, the dividend being guaranteed by the Anton Jurgens' Vereenigde Fabrieken (Anton Jurgens' United (Margarine) Works, of Oss, Holland. The object of the present issue is to provide further working capital and for the payment of 1,000,000 12½ per cent. cumulative participating preference shares of the Olympia Oil and Cake Company, Selby.

PERSONAL.—Professor Percy Frankland, F.R.S., formerly of the chair of chemistry at the University of Birmingham, has been awarded by the Council of the Royal Society the Davy Medal in recognition of his extensive research work in chemistry. Professor Frankland succeeded Professor W. A. (now Sir William) Tilden as Professor of Chemistry at the Mason College, Birmingham, in 1894, and subsequently became Dean of the Faculty of Science at the Birmingham University. During the war he undertook a good deal of research work, his services being enlisted by the Italian as well as the British Government. He was a member of a special mission to Italy, in connection with which King Victor conferred upon him the Order of St. Maurice and St. Nazarus.—The Lords Commissioners of the Admiralty have received with regret the resignation of Professor J. C. M'Lennan, O.B.E., F.R.S., whose services have been lent to the Admiralty by the University of Toronto since 1917, and who since January last has been acting as scientific adviser to the Board of Admiralty. Professor M'Lennan, who has recently found it necessary to return finally to his duties as Professor of Physics and Director of the Physical Laboratory in the University of Toronto, has rendered most important services to the Admiralty, particularly in connection with the development of helium gas.

PARLIAMENTARY NEWS.

British Dyestuffs Corporation.

In the House of Commons, Major Barnes asked the President of the Board of Trade what were the terms of the agreement of May 16, 1919, made between the President of the Board of Trade and the trustee of the British Dyestuffs Corporation; what were the amounts of the advances made and to be made under that agreement; and what was the form of the security taken by the Government?

Sir A. Geddes: An agreement to which my hon. friend refers provided for the formation of the British Dyestuffs Corporation, Ltd., and for the advance to that company (subject to certain conditions) of the sum of £530,420., being the outstanding part of a total sum of £1,700,000. which His Majesty's Government had undertaken to advance to British Dyes, Ltd., in which the new company was acquiring a controlling interest. The agreement also imposed conditions as to the articles of association of the British Dyestuffs Corporation, Ltd., British Dyes, Ltd., and Levinstein, Ltd., so as to secure permanent British control of the three companies, and to give the Board of Trade supervision over the prices charged for, and the distribution of, the companies' products. The restriction previously imposed upon the rate of dividend payable on the share capital of British Dyes, Ltd., was removed. The Government advances were secured by debentures issued by the three companies. The arrangement was subsequently modified, the Government advance, made with the intention of fostering the British dye industry, taking the form of a subscription for 850,000 £1. preference shares and 850,000 £1. preferred ordinary shares in British Dyestuffs Corporation, Ltd.

Major Barnes, on Wednesday, asked the President of the Board of Trade if the agreement of May 16, 1919, made between the President of the Board of Trade and the trustee of the British Dyestuffs Corporation on June 16, 1919, was ratified by the British Dyestuffs Corporation; by whom the proposal to modify the agreement was made; what were the grounds advanced in support of the modification; and on what date was the share capital subscribed for by the Government?

Sir Auckland Geddes: The answer to the first part of the question is in the affirmative. Suggestions as to the modification of the form of Government financial assistance were made to the Board of Trade mainly by representatives of the dye-using interests, on the ground that, though His Majesty's Government were urging those interests to give financial support to the development of the dye-making industry in this country, because of its national importance, the Government were not participating in the risks, but were taking ample security for their advances, thus throwing the whole risk upon the consumers. The Government subscription for shares, as I have already explained, was an alteration in the form of the Government's financial assistance to the dye industry in this country. This alteration was made on July 17 of this year.

Importation of German Dyes.

Major McKenzie Wood, on Monday, asked the President of the Board of Trade whether he can state the value of the dyes which have been received by this country from Germany; and on what basis their price is fixed for sale to consumers?

Sir A. Geddes: No dyestuffs have so far been received from Germany under the Reparation Clauses of the Peace Treaty, though consignments are now on the way. The values to be credited to Germany are to be fixed by the Reparation Commission, subject to certain conditions, but I understand that the Commission have not yet come to a definite decision on the matter.

Major Wood: Can the right hon. gentleman answer the latter part of the question as to price?

Sir A. Geddes: It is governed by part of the answer I have given.

Major Wood: To consumers?

Sir A. Geddes: Surely the hon. member understands that these dyes are really the property of the Reparation Commission and are to be sold in this country on their behalf. We cannot fix prices here until we know what the prices are.

Sulphate of Quinine.

Mr. Hurd asked the President of the Board of Trade why the Report of the Committee on Prices and Supplies of Quinine Sulphate has not been published as promised; and what is the cause of the delay?

Sir A. Geddes: I regret that it has not yet been possible to publish the findings of the Committee appointed to investigate the prices and supplies of quinine sulphate; the delay has been occasioned by the necessity of considering certain legal questions connected with the publication of the Report.

Explosives Storage at Penrhynedraeth.

Mr. H. Jones, on Tuesday, asked the Parliamentary Secretary to the Ministry of Munitions whether he is aware that there is ample accommodation for the storage of high explosives at His Majesty's factory, Penrhynedraeth, where there is also the necessary staff; and whether, having regard to national economy, he will cause the explosives now stored at Dinas Mawddwy to be removed to Penrhynedraeth with a view to the closing of the former store and the saving of about £700. per annum?

Mr. J. Hope: On November 3, in answer to a question put by my hon. friend, I stated that £12,000. had already been realised by sales of explosives stored in this magazine. Negotiations are now in progress for the sale of the balance of the stock, and pending a definite decision it is not considered economical to incur any additional expense, in handling and transport, by the transfer of the stock from Dinas Mawddwy to Penrhynedraeth.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence further information may be obtained:—

Spain.

H.M. Consul-General, Barcelona, reports that a Spanish firm of commission agents in that city desire to get into touch with British houses manufacturing chemical and pharmaceutical products, dyes, paints, and varnishes. (Reference No. 1073.)

Peru.

A firm of good standing in Lima are desirous of representing British manufacturers of soaps and aniline colours. (Reference No. 1081.)

Canada.

The following inquiries have been received at the Canadian Government Trade Commissioner's office, Portland House, 73, Basinghall Street, London, E.C. 2, when further information may be obtained:—

A manufacturers' agent and importer in Vancouver is desirous of effecting connections with United Kingdom shippers of English cliffstone lump whiting, iron oxides, and lithopone.

A Canadian Government Department has for disposal a quantity of molybdenite concentrate, and also of tungsten concentrate, and asks for the names of buyers who would be prepared to make offers.

THIRTY YEARS AGO.

From the "Chemical Trade Journal" of November 30, 1889.

Leblanc and Losh.—Our countryside has an especial interest in the memory of Leblanc. Our great alkali industry had its mainspring in his genius. But more than that, it was Mr. Losh, whose memory is still green on the Tyne, who was the first to put in practice in England Leblanc's process for making alkali. It throws a remarkable light on these troublous times that the process was not taken up in England till twenty years after its invention, so effectually and so long was communication between the two countries cut off by the war that raged.

The Russian Government and the English Petroleum Trade.—We learn from London that the Russian Government has despatched to England, to report on the actual conditions of the petroleum trade, M. Gulishambaroff, chief petroleum adviser to the Ministries of Finance and Crown Domains, controlling the Russian petroleum industry. M. Gulishambaroff has edited most of the Russian official literature dealing with petroleum, and is regarded as the leading technical authority in Russia. He ridicules as a canard the statement that the Baku oil supply is decreasing.

INSTAL MODERN PLANT

For Efficiency and to
meet New Conditions

WE invite enquiries on the
following plant, all of
which is constructed on
sound lines, representing the
best modern practice:—

CONCENTRATORS SULPHURIC & PHOSPHORIC ACIDS

DEARSENICATORS

For all Acids and other
Liquids.

ABSORBERS - - - -

Giving intensesaturation
Suitable for any gas or
vapour.

DENITRATORS - - -

Low Initial Cost, High
Efficiency, small ground
space, and no packing

FILTRATION PLANT

Rapid & Labour Saving.

CO_2
PLANT

H_2S
PLANT

SO_2
PLANT

NOTE.—Construction in Cast-iron, Earthenware, Lead, Acid-
resisting Iron, according to nature of Chemicals involved.

66, Deansgate,
Manchester.

ANTI-DUMPING BILL.

THE text of the Imports and Exports Regulation Bill, 1919, which was introduced into the House of Commons last week, has since been issued. The following extracts are from that section of the Bill relating to the anti-dumping proposals:—

The Board [of Trade] on being satisfied—

- (a) that goods of any class or description produced or manufactured in any country outside the United Kingdom are systematically and in substantial quantities being imported into or being sold or offered for sale in the United Kingdom at prices below the foreign value as defined by this Act or that there are good grounds for apprehending that such importation or sale is about to take place; and
- (b) that the production or manufacture of similar goods in the United Kingdom is or is likely to be thereby adversely affected,

may by order apply this Part of this Act to goods of that class or description, if imported from or if made or produced in any country outside the United Kingdom, or such country or countries as may be specified in the order, and either without any limitation of time or for such period as may be so specified, and either without any exceptions or subject to such exceptions as may be so specified.

While an order applying this Part of this Act to any goods is in force, no person shall subject as hereinafter provided import into the United Kingdom any goods to which the order applies, other than goods imported without previous sale, if the import price of the goods as ascertained by the Commissioners is less than the foreign value of the goods as stated in such sworn declaration and certificate as aforesaid:

Provided that the importation of any such goods as aforesaid shall not be deemed illegal in any such case as aforesaid if the importer before the clearance of the goods pays to the Commissioners such sum as in the opinion of the Commissioners is equal to the amount by which the foreign value of the goods exceeds the import price thereof

While an order applying this Part of this Act to any goods is in force no person shall, except as hereinafter provided, on the first sale of any such goods which have after the date on which the order came into force been imported into the United Kingdom without previous sale, sell the goods at a price which is less than the foreign value of the goods:

Provided that any such sale as aforesaid shall not be deemed to be unlawful if the vendor either—

- (a) previously to or within such time after the sale as may be allowed by the Board pays to the Board a sum equal to the difference between the price at which the goods are sold and the foreign value of the goods; or
- (b) previously to the sale has satisfied the Board that the sale at the price at which the goods are to be sold is due to depreciation in the quality of the goods or to any other cause which it appears to the Board should be taken into account.

If any person sells any goods in contravention of the provisions of this section he shall be liable to forfeit such sum as the Board may demand not being greater than the value of the goods, and any such sum shall, without prejudice to the recovery thereof as a debt to the Crown, be recoverable by the Board summarily as a civil debt.

LIST OF GOODS THE IMPORTATION OF WHICH MAY BE PROHIBITED.

Part I.

(1) Derivatives of coal tar, generally known as intermediate products, capable of being used or adapted for use as dyestuffs or of being modified or further manufactured into dyestuffs.

Direct cotton colours, union colours, acid colours, chrome and mordant colours, alizarine colours, basic colours, sulphide colours, vat colours (including synthetic indigo), oil, spirit, and wax colours, lake colours, and any other synthetic colours, dyes, stains, colour acids, colour lakes, leuco acids, leuco bases, whether in paste, powder, solution, or any other form.

(2)—(i.) Synthetic drugs (including antiseptics).

(ii.) Synthetic perfumes and flavourings, synthetic photographic chemicals, synthetic tannins, esters and acid derivatives of aromatic hydrocarbons, alkaloids and their salts

(except quinine), and the following organic chemicals: Acetamide, acetic acid, acetic anhydride, acetyl chloride, camphor bromide, cinnamic acid and its salts, ethylene bichloride, formamide, formic acid and its salts, gallic acid, lactic acid and its salts, nuclein, paraldehyde, pyrogallol, saccharine or other substances of like nature or use, salicin, thymol.

(iii.) Analytical reagents and the following fine chemicals: Barium compounds, cerium fluoride and fluorides of other rare earth metals, hydrosulphites and allied bleaching compounds, hypophosphorus acids, iron and ammonium citrate, iron tartrate, molybdic acid and its salts, phosphorus oxides and halogen compounds, salts of per-acids and artificial peroxides, silver nucleinate and proteinate, tungstic acid and its salts.

(3) Optical glass, including lenses, prisms, and like optical devices.

- (4) Scientific glassware.
- (5) Illuminating glassware.
- (6) Laboratory porcelain.
- (7) Scientific and optical instruments.
- (8) Potassium compounds.
- (9) Tungsten powder and ferro-tungsten.
- (10) Zinc oxide.
- (11) Lithopone.
- (12) Arc lamp carbons and carbon electrodes.
- (13) Magnetos and permanent steel magnets.
- (14) Hosiery latch needles.
- (15) Gauges.

Part II.

- (1) Thorium nitrate.
- (2) Gas mantles and gas mantle rings.

Writing to *The Times* of Monday with reference to the above schedule, Dr. A. P. Laurie says:—

"It is sufficiently notorious that many dyes urgently required cannot be, or at any rate are not, made by the British Dyes Combine, and must be imported from America or Switzerland. The unhappy user has to apply to the Board of Trade for a licence each time he imports, and never knows when permission may be refused by some official in Room 236, against whose decision there is no appeal. The Board of Trade in one aspect is a dye manufacturer to about one and a half millions, in the other aspect can forbid competition from rivals. The wretched user of the imported dye never knows at what moment his supply may be cut off, and therefore dreads to extend his business. To take another section, the prohibition of fine chemicals, optical and scientific instruments, and chemical glassware, is striking a serious blow at all scientific teaching and research. Not only are the prices disgracefully high, and in many cases the quality, is scandalously bad, but the two or three firms to whom this valuable monopoly has been granted cannot, or do not, choose to supply the demand. While schools and colleges are clamouring for material, they talk of delivering in six months, and the Board of Trade prohibits importation from France.

"If the rest of the list is examined, it will be found to consist of the most extraordinary collection of articles, hardly one of which has anything to do with war. I take two, zinc oxide and lithopone, as an example. There are three pigments suitable for white paint—white lead, zinc oxide, and lithopone. Before the war zinc oxide was largely imported from America, and the Government encouraged its use in place of the poisonous white lead. There is, I believe, one small factory in this country, and one small and one large factory of lithopone, which was largely manufactured and imported from Holland. What is the result of presenting this monopoly to one firm? Before the war lithopone was sold at a little over £9. a ton. To-day it is £40. a ton. I could take many other examples from this list."

The following statement appeared in *The Times* of Wednesday: In his letter on the Anti-Dumping Bill, published on Monday, Dr. A. P. Laurie, referring to the manufacture of zinc oxide, said there was only one zinc oxide factory in this country. As a matter of fact, there are six such factories, of some considerable standing, with a productive capacity of zinc oxide of not less than 20,000 tons per annum, which figure was the average consumption in this country in the years preceding the war. There are factories in London (Enthoven's), at Swansea (Down's), at Newcastle (Foster, Blackett and Wilson's), at Birmingham (Chance and Hunt's), at Luton (Fricker's), and at Stoke-on-Trent (Keeling and Walker's).

FRENCH CUSTOMS DUTIES ON CHEMICALS.

(Concluded from page 543.)

THE following statement, reprinted from the *Board of Trade Journal*, gives particulars regarding the proposed new classification of, and rates of duty on, the principal chemical products contained in Article I. of the Bill referred to in a recent issue, recently passed by the French Chamber of Deputies and the Senate, but not yet promulgated as law. The rates of duty at present leviable on the articles covered by the new proposals are shown for purposes of comparison. Goods of United Kingdom origin and manufacture are entitled to the rates of the "Minimum" Tariff. Italicised and other letters attached to the rates of import duty refer to the explanatory notes which are given at the end.

NOTE.—*Ad valorem* duties are indicated by the use of the "per cent." sign (%). In all other cases the rates are quoted in francs (and centimes) per 100 kilogrammes. Unless otherwise indicated, duty is levied on *gross* weight when the rate of duty is 10 fr. or less per 100 kilogs., and on *net* weight when the rate exceeds that figure.

y.—The present rates on formic acid containing over 60% (by weight) of free acid are:—"General," 25 fr., "Minimum," 18 fr., per 100 kilogs. The "Coefficient of Increase" of the rates of duty on formic acid is 1.1.

z.—Containing 60% (by weight) or less of free acid—"Coefficient of Increase" = 3.

A.—Containing over 60% (by weight) of free acid—"Coefficient of Increase" = 3.

B.—"Coefficient of Increase" (Decree of 8th July) = 2.9.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—The coal strike in the United States is delaying steamers fixed for loading nitrate in Chili, and the shipments thence in the first half of this month point to a much smaller quantity than was expected, leaving early despatch. The Producers' Association, which is now said to have sold about 1,100,000 tons for delivery up to the end of March, may, as we anticipated, find some difficulty in regard to sufficient tonnage, this being the more regrettable since the nitrate has already been waiting so long, and losing weight. November is the best month for shipment of the fertiliser by sailing vessel to arrive in Europe for the spring season, but for some time to come the larger part will probably be shipped by steamer, so many of the former having been lost during the war. The *Cap Horn*, one of the largest French nitrate carriers, left Antofagasta at the beginning of July, and has not since been heard of, the reinsurance premium being 20 guineas per cent. The modest requirements of the British farmer will at all events be easily satisfied, as parcels of a thousand tons or more keep arriving from Chili by the regular liners, the quotation being about £19. per ton, cost, freight, and insurance; the present extremely high charges for landing and delivery account for the wide margin between the above price and that "free on rail" quoted in another column. Continental consumers of nitrate of soda are said to be buying for spring delivery in spite of the fabulous prices due to currency depreciation referred to in our last issue; but interest in the article is at a very low ebb in this country, and business seems to have come to a standstill in Chili since the Producers' Association again put up its "fixed prices."

Sulphate of Ammonia.—Home demand is still reported good for this material, the gradually ascending scale of prices apparently bringing in orders earlier than would otherwise be the case. There is not a strong export position. The price for export is a good one, but either there is not the material available or else the general conditions of the export trade are not attractive, even in view of the better prices obtainable. At the lowest, however, £25. per ton; f.o.b., is being quoted for export.

Basic Slag.—Orders for this fertiliser still come in freely. Many of these are accompanied by plaintive requests for early delivery. That is not a condition that can be complied with, however. Many of the works are now something like two months behind in deliveries. This position seems to recur year after year with unvarying regularity. The material is certainly very popular, and there is no doubt that a very much larger market will be available when supplies are increased and deliveries expedited. Basic slag is a fertiliser with a very big future before it.

Bone Meals.—Business remains on the quiet side in bone meals. The Indian supply of bone meal is declared to be very heavy, but extreme difficulty is still found in procuring tonnage, and in one quarter it is said that £17. per ton has to be paid for the article on arrival. On the other hand, concessions which certain shippers recently made have brought buyers out for small business for shipment running up to about £14. 10s., c.i.f. terms. Imports, however, are very unimportant.

Blood, Tankage, Etc.—There appears to be a little increased firmness in dried blood, and as much as 33s. to 34s. per unit of ammonia, c.i.f. terms, has been quoted. There is a very good inquiry for foreign tankage, but little available stock in hand. Values in this section appear to be 32s. per unit of ammonia and 2s. 6d. per unit of phosphates. In meat meal there is no change to be reported, but demand is steady, with values roughly approximating to the above-mentioned prices.

Potash.—Potash fertilisers are again declared to be rather more plentiful, but Alsatian supplies do not figure so largely as was expected to be the case by this time. The position with regard to American potash is still very uncertain. The industry has been marking time since the Armistice owing to the fact that American consumers have been expecting that heavy shipments of foreign potash would be resumed at somewhere near the pre-war prices. Therefore they have held off buying domestic potash at ruling values. The result of this also has already been recorded in these columns, and it has meant the closing down of many plants in Nebraska, California, and elsewhere. Everyone waits upon a definite policy with regard to the exportation of potash salts from Germany

and France to the United States. If unrestricted importation is allowed at prices even 50 per cent. greater than in 1913, we think very few, if any, of the domestic producers would be able to compete. What would save them would be a policy assuring a market for the domestic potash at a sufficient minimum figure per unit for several years. The imports of Alsatian potash salts into the United Kingdom during the week ending November 22 were 885 tons of sylvinite, 14 per cent. Current quotations are as follows: Sylvinite, 14 per cent. (French kamit), £7. per ton; sylvinite, 20 per cent. (French potash salts), £8. 7s. 6d. per ton; muriate of potash, 80 per cent., £19. 7s. 6d. per ton.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

Important inquiries are still coming to hand from foreign markets for all kinds of tinplates, and manufacturers are busy in executing orders. The supplies now are not equal to the demand, but the greatest difficulty the makers have to contend with is the shortage of suitable men for the mills which they intend to restart. The Dynevor tinplate works, which changed hands some few months ago, and have been idle for some time, during which a modern plant has been installed, have recommenced operations.

There continue to be satisfactory markets for patent fuel, and prices are steady. The announcement of the reduction in the price of coal has not had much, if any, effect on the briquette trade, inasmuch as manufacturers are booked up to the end of this year, but no doubt there will be an easing off in quotations for new contracts. Colliery owners are steadily competing with each other for prompt orders, and were on Tuesday making concessions of from 3s. to 6s. per ton to immediate buyers.

Coke markets are strong and steady, and orders on hand will keep the ovens going for several weeks to come. This means that the production of by-products will in all probability be much larger than was anticipated a short time ago. Sulphate of ammonia is moving off extremely satisfactorily, and there is no trouble in selling the other products.

A good market has been opened up for silica bricks, and the South Wales owners of silica quarries have for a few years back turned their attention to the making of refractory materials. They are now firmly established not only upon the home markets, but have also good customers in the French steel makers and others.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The condition of the hematite pig-iron trade in the district between Workington and Carnforth, where there are now only twenty-one furnaces in blast, is not such as to encourage the hope that the quantity of coke required for furnaces on ordinary iron will not further diminish, and the prospects of the coking industry, if it were to remain wholly dependent on the iron trade, as hitherto it always has done, would be gloomy indeed. It is plain that the worst of the depression that is settling upon the iron trade in Cumberland and North Lancashire has not yet been seen. Furnaces on low phosphorus brands, as well as on ordinary qualities of iron, will be damped down in the course of a week or two, and then East Coast supplies as well as supplies of local coke will be decreased. Despite the tightness of affairs, however, in the iron trade, the outlook of the coking industry is improving; and, as a matter of fact, there has been such an improvement during the last week or two that two of the plants are now in full operation, and another is working at two-thirds of its capacity. When the remaining plants are to become similarly busy depends more upon the release of trucks than upon the growth of the demand for coke for export. Continental requirements have become so large that if the wagons could be found to take the coke to the East Coast for shipment the ovens would speedily be needed to be put into full blast. Already, some thousands of tons of coke have gone across to the East Coast, and a small supply, too, is being shipped locally. The by-product market is fairly brisk. It is not paying at present to rectify, the demand for crude benzole being far in excess of supply. Sulphate of ammonia is quieter, and is sticking somewhat. Tar is a good market, and pitch and creosote are moving away fairly well.

LEGAL INTELLIGENCE.

Customs Seizure of Pyrogallie Acid.

An important test case relating to restrictions on imports by the prohibition of the import of pyrogallie acid was heard by Mr. Justice Sankey in the King's Bench Division on Wednesday, when a non-jury action was brought by the Crown, through the Attorney-General, against John Brown, trading as Brown and Forth, chemical manufacturers, of 10, Dolefield, Bridge Street, Manchester, and Farringdon Street, London.

The Attorney-General said the suit was one, by information, for the condemnation of six packages of pyrogallie acid, claimed to be forfeited as having been imported contrary to the Prohibition of Imports, No. 32, Proclamation of 1919. The real point on a certain view of the facts was as to whether that proclamation was properly made. It was dated June 25, 1919, and was made under Section 43 of the Customs Consolidation Act of 1876, which related to the importation of certain articles into the United Kingdom. The section provided that the importation of arms, ammunition, gunpowder, or any other goods, might be prohibited by proclamation, and the proclamation laid down that, whereas it was expedient to prohibit the importation of certain goods, chemicals of all descriptions were prohibited from importation unless imported on licence given by the Board of Trade. In view of statements which had been made, continued Counsel, perhaps it was right for him to observe that the conduct of the Executive in that matter had been consistent from the outset. This was the

2nd proclamation of its kind, and, since the war began, no matter what the composition or complexion of the Government had been, or what the Law Officers were, the same interpretation had been put on the section throughout. The Act was dealing manifestly with all goods of any kind, and began by saying that all goods may be imported unless they were prohibited, but that the importation of Army ammunition powder or any other goods may be prohibited by proclamation or by order of Council. The words of the section meant exactly what they said, and not other goods of the same genus as arms, ammunition, or powder.

The facts in the case, continued Counsel, were not in dispute. On August 17 this year the pyrogallie acid was imported on the steamer *Boric* into the port of Manchester by the defendant, and on August 28 the goods were seized by Wilfred Buckley, the Customs Officer at Manchester. The following day notice of seizure was given to the defendant, and on September 1 the latter wrote pointing out that the goods were ordered on June 17, 1919, from a Canadian chemical works, and were therefore ordered before the regulations, by virtue of which they were seized, were enacted. They also pointed out that it was obviously for their own benefit that the suppliers had shipped the goods from New York and not from Montreal.

His Lordship, dealing with the contention that all free imports could be stopped by order in Council, said that might be right, but if it was it was a little astonishing.

The Attorney-General submitted that a general power was given to the Executive, to be exercised in times of emergency, to prohibit, by proclamation or order in Council the importation of any goods. Any action under this power which was bitterly resented by public opinion would, of course, be followed by the usual Parliamentary consequence.

His Lordship: There is nothing about times of emergency in Section 43.

Counsel: The words are not there.

Proceeding, the Attorney-General dealt with the uses of pyrogallie acid, and said its most familiar use was for developing in photography. No one required to be told that photography was indispensable in warfare; but, more than that, this acid might be used for the production of poisonous gas, and it belonged to the same family as picric acid, which was an explosive.

Mr. Wright, K.C., argued that the acid was an ordinary commercial substance, and was used for other purposes than photography. That case, he proceeded, turned on the construction put on the Section of the Consolidation Act. The real issue was whether by the Act of 1876, which repealed an earlier Act of 1856, the Legislature had vested in the Executive the absolute power, at their discretion entirely, to reverse or abrogate the policy of free imports and substitute a limited or unlimited power of restriction on imports and exports.

The hearing was adjourned.

Chemical Contract: Arbitration Dispute.

In the King's Bench Divisional Court on Thursday (November 20) before Mr. Justice Coleridge and Mr. Justice McCardie, Messrs. T. W. Watson and Co., chemical and general manufacturers, of Eldon Street, London, sought to set aside an award made by a commercial arbitration in favour of Messrs Mann and Cook, St. Michael's Alley, Cornhill, E.C., with respect to two contracts for the supply of sulphate of alumina.

For the appellants Mr. A. Powell, K.C., said the appeal was based on the alleged erroneous conduct of the arbitrators, who, they said, rushed through matters with the result that the applicants suffered badly, the award being made against them. There were two contracts for the sale of sulphate of alumina, one for 50 tons and one for 40 tons, at £10. 5s. per ton. The contracts were made in February, 1918, and delivery was to be made between February and May, 1918. These contracts were subject to certain conditions, which seemed to have been absolutely ignored by the arbitrators. That was the reason appellants were there that day. The goods were ordered by Messrs. Watson and Co. from a man named Taylor, who was to get them from Pochin and Co., of Manchester. Messrs. Mann and Cook were the purchasers. The goods were not forthcoming, and Messrs. Mann and Cook bought against Messrs. Watson and Co. at a much higher price, and claimed that they were entitled to the difference as damages. The arbitrators awarded them £517. 10s. damages. This sum, observed counsel, would have been somewhere near the mark if there had been no conditions, but these were not gone into by the arbitrators. These gentlemen were originally a Mr. Roff and Mr. McCarthy, but the place of the latter was eventually taken by Mr. Pintus. Messrs. Watson and Co. put the matter into the hands of their solicitors and expected to get due notice of the arbitration, but they only received an intimation that the arbitration was to be held an hour before it took place. Mr. Watson was in the Naval Air Service, and he was represented at the arbitration by his stepmother, his solicitors being unable to be present. The contracts, continued counsel, contained the condition: "Subject *force majeure*, and especially clause one and special war clauses." There would have been no arbitration if the war clauses had been set out in full. The important war clause, which was well known in the trade, was: "Reasonable provision having been made by sellers for the supply of the goods, the contract is subject to their orders with works or suppliers being fulfilled." This clause, it was contended, applied to the contracts, although it was not set out in full.

Legal argument ensued, and eventually the parties agreed to refer the matter to Mr. George Wallace, K.C., as sole arbitrator.

A Contract for Soap: Arbitration Award Sent Back.

An alleged breach of contract for the supply of soap was argued before Mr. Justice Coleridge and Mr. Justice McCardie, sitting as a Divisional Court in the King's Bench Division last week, when they heard the case Martins and Co., Ltd. v. Reginald Godfrey and Co.

According to Mr. Neilson, K.C., for the respondents, an arbitration was brought by Messrs. Godfrey against Messrs. Martins on an alleged breach of contract between the parties for the supply of certain quantities of soap. Claimants said that no deliveries had been made, and for this breach of contract they asked for damages. The claim was for non-delivery of 500 tons of soap on the basis of the difference between the invoice price of £40. a ton and the market price of £61. a ton. The defence raised the point that there was no contract and therefore no breach and no damages. Respondents requested the arbitrators to state their award in the form of a special case. They agreed to do so, but they published the award without any reference to respondents' request as to a special case. The arbitrators were Messrs. Taylor and Pintus, and they appointed an umpire named Barnett. The point in the arbitration was that the original contract was made between the Williams Chemical Manufacturing Company and the claimants, Messrs. Godfrey. The latter firm said that Messrs. Martins took over the contract, or that the Williams Co. were their agents for that purpose. Appellants wanted to know whether there was a contract between Messrs. Godfrey and Messrs. Martins; if so, what were the terms, and there having been no deliveries, were Messrs. Martins excused from non-performance of the contract, if any? If not, what was the measure

of damages? The award was for upwards of £8,000 against the appellants. The question was whether there was a contract between respondents and the claimants with respect to the transaction with Williams and Co., who seemed to be intermediaries.

Mr. Patrick Hastings, K.C., argued that the arbitrators were right in taking the view that the question was merely one of fact, and that therefore they had not been guilty of error of conduct by refusing to state a case.

Mr. Justice Coleridge, giving judgment, said that applicants' contention that there was no contract because the contract was not made with them but with the Williams Chemical Manufacturing Company was *prima facie* a question of fact. As to the second point with respect to the construction of the contract this depended on the interpretation of a number of documents and was a question of law. Either party could have insisted on a case being stated, or a postponement of the award to give them an opportunity of applying to the Courts. By an error of judgment appellants had been deprived of that opportunity before the delivery of the award. He felt that the proper course was to set aside the award and remit to the arbitration the points raised—viz., Was there any contracts between the applicants and respondents, if so, what were the terms of it; were respondents excused performance of the contract, and if not what was the proper measure of damages?

Mr. Justice McCardie agreed.

Palm-oil Soap.

A claim for damages for alleged breach of contract for the non-delivery of palm-oil soap came before Mr. Justice Roche in the Commercial Court of the King's Bench Division on Thursday (November 20). The plaintiff was Mr. Alfredo Beer, a merchant carrying on business in Cairo, Egypt, and the action was brought against Messrs. A. Wilson and Co., export merchants, of Great Tower Street, London.

Plaintiff's case was that on November 23, 1914, he invited defendants to quote for a supply of palm-oil soap, which it was stated was required for sale to the Egyptian Government for delivery in April or May, 1915, and the plaintiff requested a quotation not later than January 10, with the offer firm till March 15. Defendants offered to supply the soap, and quoted 30s. 3d. per box, c.i.f., war insurance risks included. In February, 1915, plaintiff placed an order on the terms of the quotation for 68,800 boxes of soap. It was alleged that in breach of the contract defendants wrote to the plaintiff on March 5, 1915, refusing to accept the offer.

Mr. H. Drysdale Woodcock, on behalf of the plaintiff, said the whole case rested on the correspondence, except one point, and that was the amount of damages. Plaintiff, living in Cairo, was aware that the Egyptian Government were looking out for supplies of various things, amongst them soap, and he received on October 1, 1914, from the defendants a circular letter holding themselves out as able to supply all sorts of things, happily amongst them soap. On November 23 plaintiff wrote to the defendants asking for a firm offer until March 15, 1915. Defendants made a quotation for the soap, and in due course plaintiff obtained a contract with the Egyptian Government. On February 16 plaintiff sent the defendants a formal order, but the soap was never supplied. The Egyptian Government bought against the plaintiff and debited him with the difference, and plaintiff had lost the profit which he would have made on the transaction. The position was taken up by the defendants, said counsel, that the offer was not a firm offer.

Mr. W. Ellis Hill conducted the case for the defendants, and their answer to the claim was that the parties never came to a concluded bargain on the matter.

Mr. Justice Roche said in his judgment the defendants never were bound by any concluded agreement. Accordingly, the action failed, and there would be judgment for the defendants with costs.

Manufacturing Chemists and an Employee's Notice.

In the Bow County Court, before Judge Graham, K.C., Henry Wood, a carman, sued Messrs. Thos. Hill Jones, Ltd., of Invicta Works, Bow Common Lane, E., manufacturing chemists, to recover £2. 15s., a week's wages in lieu of notice.

Mr. Levey said the plaintiff had been in the employ of the firm for eight years. Just prior to being dismissed he worked in the yard for ten weeks. On May 17 he was discharged at an hour's notice. He also received a packet, in which was a week's money, and on it was written: "We

shall not require your services after to-day owing to slackness. Enclosed is one week's money in lieu of a holiday, to which you are entitled." Counsel said that the plaintiff claimed to be entitled to a week's notice money as well as the holiday. There was some correspondence, and in that the defendants wrote to say that if he had mentioned the matter at the time there was every probability that he would not have been treated unkindly, and they wound up by saying: "All we ask for is a fair week's work for a fair's week's money." Plaintiff said he had always been paid for holidays, bank holidays, etc., and it seemed to him an impossible position to take up to discharge a man like that at an hour's notice. He was quite willing to admit that it was a good firm to work for, and that they were generous to their employees. Plaintiff added that he had to attend to his horses on Sunday, and counsel said that under the recent Board of Arbitration decision a carman who looked after his horses on Sunday became a weekly servant.

Mr. A. A. Robinson, for the defence, produced a document which read as follows: "I hereby agree that I am a daily servant, and subject to dismissal at an hour's notice, notwithstanding that wages are paid for convenience weekly." Mr. Robinson said that was dated September 19, 1911, and asked plaintiff if he remembered signing it. Plaintiff said he supposed that he did, but that was years ago, and his conditions of employment had been altered very much since then.

Mr. Robinson: I submit it is a distinct agreement, and that there is nothing further to answer.

Mr. Levey: I cannot carry it further.

Judge Graham: Judgment for the defendants, with costs.

Grays Chemical Company, Ltd.

The petition for the compulsory winding-up of the Grays Chemical Company, Ltd., was again before Mr. Justice Astbury in the Companies Winding-up Court on Tuesday, after several adjournments.

Mr. Lavington now asked for the order to be made, as he had been told that the negotiations for the raising of capital to pay debts had broken down.

Mr. Vanneck, for the company, said a large sum was owing to the bank as a first charge, and another large sum was owing to the debenture holders, and the evidence was that there was no chance of the unsecured creditors getting anything at all unless some arrangement could be carried through.

His lordship granted another 14 days' adjournment on condition that the company did not pass a voluntary winding-up resolution.

Quality of Cream of Tartar.

Judgment has been given in the Sheriff Court, Glasgow, by Sheriff Lyell, in the complaint entered by Mr. William Weir, sanitary inspector, Rutherglen, against James Buchanan, grocer, 16, Main Street, Rutherglen, that on August 1 he sold cream of tartar which contained 0.003 per cent. (one-fifth grain per lb.) of lead, whereas genuine cream of tartar should not contain more than 0.002 per cent. (one-seventh grain per lb.) of lead. The case was reported in our last issue. The complaint was dismissed, Sheriff Lyell expressing the opinion that the unavoidable introduction of lead into the cream of tartar during the process of manufacture did not render the article different in nature, substance, and quality from the article demanded. It had been proved in the evidence, he said, that cream of tartar containing 0.004 per cent. of lead was just as harmless as that containing 0.002 per cent.

Colnbrook Chemical and Explosives Company.

At the London Bankruptcy Court on Tuesday, before Mr. Warley, Official Receiver, the statutory meeting of creditors and contributories was held under the liquidation of the Colnbrook Chemical and Explosives Company, Ltd., of Colnbrook, Middlesex, and 1, Queen Victoria Street, E.C.

The statement of affairs showed a total deficiency of £54,461. 17s. 9d., and this deficiency was accounted for in the following manner: Gross loss in carrying on business from date of formation of company to date of appointment of the Receiver, £14,161. 19s. 3d.; law costs had amounted to £746.; commission and bonus on debentures, £7,875.; interest on loans, bills discounted, and costs re overdue accounts, £1,049.; interest on debentures, £644.; and directors' fees, £1,200. The losses written off for depreciation amounted to £28,377. 6s. 2d. The company was registered in July, 1916,

with a nominal capital of £21,000., to carry on the business of manufacturers of gun-cotton, explosives, and munitions of war. The failure of the company was attributed to incorrect estimates of the company's engineers, late delivery of machinery, and further capital expenditure on plant required to meet the demands of the Ministry of Munitions.

After a lengthy discussion, it was decided to leave the estate in the hands of the Official Receiver, as liquidator, assisted by a Committee of Inspection consisting of the following gentlemen: Mr. Cooper (J. R. Wells and Co.), Mr. Messer (Wraysbury Chemical Works, Ltd), Mr. Rogers (Heron, Rogers and Son), Mr. Manville and Mr. Goodwin. At a meeting of contributors which was subsequently held a similar resolution was passed.

REPORTS OF COMPANIES.

Weardale Lead Company, Ltd.

The report for the year to September 30 last states: The year has been one of great difficulty in various respects, and particularly owing to the unstable condition of the lead market. In October, 1918, the mean price of lead was £29. per ton, and soon afterwards it advanced to £40. The latter figure, however, did not rule long, and during the greater part of the company's financial year the price remained low—namely, between £22. and £26. per ton. This condition of things, accompanied by higher working costs, has naturally militated against the results for the twelve months as compared with preceding years. At the time of making this report the market has recovered, lead is again quoted at well over £30. per ton; 2,837 tons of dressed lead ore have been produced during the year, 532 tons of ore purchased, and 2,175 tons of ore smelted. The produce from the smelt mill was 1,869 tons of pig lead, which was disposed of (mostly before the heavy fall in the lead market) at an average price of £31. 8s. 6d. per ton net. The company having entered into an advantageous arrangement over a period of years for the sale of its ores unsmelted, operations at the smelt mill have been suspended, and deliveries of ore commenced in May last. During the five months to September 30 the quantity of ore thus delivered amounted to 1,220 tons. The depressed state of the lead market adversely affected the value of this ore, which realised £15. 6s. 2d. per ton on an average price of £23. 15s. 2d. for pig lead—a relatively higher price for the ore than would have been obtained for the company's lead. The amount brought forward from September 30, 1918, was £7,177, from which has been deducted £2,798, leaving a net sum of £4,379. The profit for the present period, including interest, dividends on investments, etc., is £12,736., or, less tax, £7,421., making, together with above balance, £11,800. Out of this sum an interim dividend of 6d. per share has been paid, amounting to £2,448., leaving a balance of £9,352. The directors recommend that this sum be appropriated as follows: To pay a final dividend of 1s. per share, free of tax, making, with the interim dividend already paid, 7½ per cent. for the twelve months, which will absorb £4,896., carrying forward £4,456.

Castner-Kellner Alkali Company, Ltd.

The report for the year ended September 30 last states that the net profit, after allowing for the amount required for keeping up works, plant, and machinery to the highest state of efficiency, is £190,655., and £48,819. was brought in, making £239,474. Deducting debenture interest, £7,598., and interim dividend paid June 10, 1919, £60,000., the available balance is £171,876. The directors recommend placing £50,000. to depreciation reserve, increasing that account to £637,500., and final dividend of £7. per cent., making £13. per cent. for year, payable December 3, leaving £51,876. to be carried forward. The usual sum of £5,000. has been paid to the trustees for the debenture stockholders for sinking fund, and invested in their names.

Amelia Nitrate Company, Ltd.

Sir Bernard Greenwell, Bart., presiding at the meeting on Friday of last week, said that on the signing of the Armistice last November the purchase of nitrate by the Allied Governments had stopped suddenly; those Governments were left with very large stocks on hand, and until those had been liquidated producers were precluded from entering the market. The latter had all been left with heavy stocks, and

it was only late in the spring of the present year that the Government stocks had been absorbed by the consuming markets. In the meantime, at the request of the Chilean Government, a Producers' Association had been formed, with a view to controlling the output, export, and sale of nitrate. The great majority of producers had joined that Association, and were bound by its statutes for five years.

As to the prospects of the industry in general, it would be a rash proceeding to try to prophesy. He had no doubt that large quantities of nitrogenous fertilisers would be required all over the world during the next few years, but whether Chilean nitrate would hold the field as formerly or would suffer from the competition of the various artificial products prepared for the market it was impossible to foretell. Exchange, freight, and finances would have an important word to say in that connection.

Santa Catalina Nitrate Company, Ltd.

The reorganisation of the Nitrate Association was referred to at a meeting of the Santa Catalina Nitrate Company, Ltd., on November 20. Mr. F. G. Lomax (the chairman) said that since last year's meeting reorganisation had become an accomplished fact by the adhesion of all but the German producers, with whom negotiations were proceeding, and two American-owned companies which were debarred from joining owing to the United States Sherman Law. At first doubts had been entertained as to the Association's being able to accomplish its object, but it had made an auspicious start, having concluded during the past few weeks sales aggregating some 25 million quintals of nitrate for delivery during the coming season. Those sales were a beginning of the resumption of ordinary trade.

As to the outlook, in view of the high rates of freight and the financial and political conditions in Central Europe, it was impossible to arrive at any useful estimate. But if Germany and Austria were to take what they urgently needed, there would be a market for all that could be produced; but they were not yet in that position, and until they solved the problem of their currency in relation to international trading there seemed little prospect of an outlet for any considerable quantity of nitrate in those countries. In other directions prospects were encouraging.

Amalgamated Zinc (De Bavay's), Ltd.

The report for the half year ended June 30 states that 81,567 tons of tailings were treated, producing 22,016 tons zinc concentrates and 1,164 tons lead concentrates of average assay value. Owing to industrial disputes, the mill was operating during 18 weeks only. Profit on working account was £39,106., including £22,782. increased profit from adjustments in respect of previous periods. The balance to the credit of appropriation account at December 31 was £14,454., to which add £44,359. transferred from profit and loss account, making £58,813., out of which dividend No. 28, paid April 16, absorbed £25,000., £9,744. was transferred to reserve for depreciation, and £24,069. to equalisation reserve. Surplus of liquid assets over liabilities amounted to £184,213., not including payments on account of 365,000 tons of tailings paid for but untreated, or £283,435. paid up on 295,710 shares in the following companies: 160,000 in Electrolytic Zinc Company of Australasia Proprietary, Ltd.; 119,250 in Minerals Separation and De Bavay's Processes Australia Proprietary, Ltd.; 10,000 in Barrier Roaster Company Proprietary, Ltd.; 3,500 in Metals Prospecting Syndicate, N.L.; 2,000 in Zinc Investigation Proprietary, Ltd.; and 960 in Zinc Producers' Association Proprietary, Ltd. Operations at Risdon works were satisfactory until August 14, when the works were closed down through shortage of calcines due to shipping difficulties, but it is expected to resume operations the middle of December.

DIVIDENDS.

CASSEL CYANIDE COMPANY, LTD.—Final dividend of 1s. 6d. per share, making 2s. per share for the past year.

NON-FERROUS MATERIALS.—The following particulars show the stocks—exclusive of old metal and scrap—in this country in possession of the Minister of Munitions on November 1: Copper, 18,492 tons; spelter (G.O.B.), 14,727 tons; spelter (refined), 11,563 tons; aluminium, 9,353 tons; soft pig lead, 64,832 tons; nickel, 2,100 tons; antimony regulus, 3,200 tons. It is explained that a proportion of the above stocks is already sold to the trade for forward delivery.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

November 17th to 22nd (inclusive).

Electrolytic Apparatus. Ashcroft, E. A. 28,845.
 Ferrochrome Alloys. B. Sestine, W. B. 28,763.
 Catalysts. Brochet, A. 29,002.
 Purification of Solutions of Zinc Sulphate. Compagnie des Produits Chimiques et Métaux de la Camargue. 28,471.
 Gas-fired Glass-making Furnaces. Curd, S. G. 28,886.
 Composition Paint. Dubois, U.; and Richard, J. 28,728.
 Metal Compound Powders. Heskett, W. P. 29,031.
 Purification of Sulphur. Hood, J. J. 28,489.
 Aluminium Alloys. Hurst, J. E. 28,546.
 Treatment of Petroleum, etc. Illing, V. C.; and Kelly, J. 28,614.
 Sub-limate for Borax or Boric Acid or Mixtures Thereof in Technical Processes. Jones, B. D.; and Kelly, A. A. 28,837.
 Presses for Food-stuffs. Jones, B. D.; and Kelly, A. A. 28,838.
 Manufacture of Boric Acid from Boron Ores. Jones, B. D.; and Kelly, A. A. 28,839.
 Manufacture of Borax or Boric Acid from Sodium Pentaborate. Jones, B. D.; and Kelly, A. A. 28,840.
 Non-inflammable Materials. Mandleberg, J. H.; Mandleberg and Co., J.; and Perkin, W. H. 28,593.
 Softening Water by Base-exchanging Bodies. Menzies, S. H. 29,137.
 Leaching and Separation of Ores. Middlemiss, E. T. 28,633.
 Cracking Hydrocarbon Oils, etc. Nelson, J. 28,575.
 Treatment of Ores, etc., by Flotation. Partington, J. W.; and Taylor, M. T. 28,999.
 Porous Charges for Containers for the Storage of Explosive Gases Dissolved in Liquids. Pintsch, Akt.-Ges., J. 29,003.
 Treatment of Lead Zinc Sulphide Ores. Stannard, O. J. 28,463.
 Motor Fuels. Stevens, E. W. 29,010.
 Centrifugal Separators. Sturgeon, R. A. 29,042.
 Tungsten. Vautin, C. T. J. 29,116.
 Treatment of Mixed Zinc Sulphide Ores. Vautin, C. T. J. 29,035.
 Manufacture of Thorium. Wade, H. (Lindsay Light Co.). 28,749.
 Process for Double Decomposition of Substances. Wang, L. M. E. 29,030.
 Destructive Distillation of Coal. Wellington, S. N. 28,863.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25 Southampton Buildings, Chancery Lane, W.C.

The numbers in heavy type are those under which the Specifications will be printed and abridged and all subsequent proceedings will be taken.

1918.

Concentration of Ores. Scott, W. A. 13,259. **118,627**
 Apparatus for Quenching Coke. Wellington, S. N. 13,152. **134,867**
 Manufacture of Ice. Ryder, F.; and Pluperfect Refrigeration Co. 14,291. **134,868**
 Filtering or Otherwise Treating Air or Gases. Heenan and Froude; and Cruyt, L. 16,348. **134,873**
 Incandescent Gas Mantles. Wilson, J. 16,465. **134,875**
 Germicide Solution. Weeks, C. A. 16,606. **134,880**
 Magnesium Sulphate. Dutt, E. E.; and Dutt, P. C. 17,076. **134,884**
 Fixation of Atmospheric Nitrogen in a Blast Furnace. Haslam, E. W. 17,365. **134,885**
 Manufacture of Briquettes from Fine Dust, and the Products Resulting Therefrom. Michel, C.; and Raskin, V. 17,945. **134,886**
 Manufacture of Briquettes from Sawdust, and the Products Resulting Therefrom. Michel, C.; and Raskin, V. 17,946. **134,887**
 Recovery of Tungstic Acid from Ores. Imperial Trust for the Encouragement of Scientific and Industrial Research; and Stannard, O. J. 18,206. **134,891**
 Purification of Natural Graphites. Ridoni, E.; and Soc. Talco E. Grafiti Val Chisone. 18,330. **134,894**
 Hydrogen Generators. Griggs, A. R. 18,582 and 18,384. **134,901 and 134,902**
 Producing Combustible Gas. Pickard, W.; and Dobson, D. R. 18,430. **134,907**
 Electro-depositing Magnesium. Seward, G. O. 18,467. **120,908**
 Cleansing and Polishing Powder. Slaughter, L. V. 18,540. **121,592**
 Automatically Discharging Lime, Cement, and Like Kilns. Candiot, C. 18,542. **131,269**
 Recovering Potassium Compound in Connection with Cement Manufacture. Mond, A. (International Precipitation Co.). 18,554. **134,920**
 Alloying Furnaces. McGahan, F. L. 18,616. **134,927**
 Treatment of Gases Containing Sulphur Dioxide. Espenbahn, E. V. 18,772. **134,943**
 Centrifugal Separators. Sturgeon, R. A. 19,233. **134,966**
 Electrodes of Electric Furnaces. Soc. Electro-Metallurgique Française. 19,756. **121,282**
 Baking-powder and Self-raising Flour. Berry, A. E.; and Boake, Roberts, and Co., A. 19,815. **134,987**
 Production of Petrol. Tinker, F. 21,289. **135,015**

1919

Recovery of Lead and Tin from Their Solutions. Rumbold, W. G. 2,132. **135,052**
 Alloys Rich in Lead. Arend, J. P. 2,496. **135,056**
 Pure Electrolytic Copper from Cement Copper. Sandberg, A. G.; and Thomasson, T. E. 11,812. **135,125**
 Separating a Salt from Its Solution by Evaporation. Piccard, P. 12,292. **132,771**

Purification of Alkaline Chloride Solutions which are to be Electrolysed. Riiber, C. N. 14,875. **135,141**
 Purifying the Gases Intended for the Synthetic Production of Ammonia. L'Air Liquide, Soc. Anon. pour L'Étrude et L'Exploration des Procédés G. Claude. 16,996. **129,637**

 Filtering Apparatus for Gas-coal Media. Pictet, L. D. 28,366. **135,216**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Potassium Permanganate. C. Dreyfus and J. J. Bloch, Manchester. British Patent, 132,842, of 1918.

In the manufacture of potassium permanganate, the sodium manganate employed as starting-material is first transformed by electrolysis into sodium permanganate, which is then converted into potassium permanganate by the interaction in solution with the quantitative amount of a potassium salt.

Catalytic Apparatus. L. C. Jones, Syracuse, New York; and C. L. Parsons, Washington, U.S.A. British Patent, 132,551, of 1918.

The oxidation of ammonia is effected without pre-heating of the gases by means of a contact element in the form of a hollow laminated body of fine gauze constructed of or carrying catalytic material arranged within a chamber having heat-reflecting inner walls. A strip of gauze is wound around an end piece 2 and spider 3 and secured in place by collars 4. The spider 3 forms the top of a cylinder 5 into which leads the gas inlet 9 through which passes a screwed rod 8 joined by a socket to a rod 7 for tightening the gauze laminations, the rod 7 being kept from rotating by a pin 10. The outer chamber 11 may be lined with glazed bricks 13, and is provided with sight-apertures 14.

Potassium Salts. A. C. Auden, Westminster. British Patent, 132,855, of 1918.

Minerals such as feldspar, mica, micaceous schist, muscovite, pegmatite, china-stone, glauconite, and zeolites such as those found in a basalt matrix, are mixed with lime and salt, ground, and roasted at 900–1,000° C. for such a time that a small proportion of "dead lumps" are formed. The charge is spread out to cool and raked with wooden rakes. The cooled material is sifted, the "dead-lumps" being then ground, and treated again, while the fine material is leached in hot water; but when glauconite or the like is employed, the leaching is performed in an autoclave, steam being admitted until the temperature rises to 240–205° C. The evaporation of the solution is preferably effected in two evaporators in series when glauconite is employed, the first producing phosphate and the second chloride. The residue is mixed with ground—preferably unslaked—lime, and preferably with a small quantity of alum or aluminium sulphate,

kneaded, dried, and the heat gradually brought up to 1,100° C., the mass being firmly but not too tightly packed in the furnace. The mass is spread out to cool, raked with wooden rakes, sifted, and the coarse material ground. The product is white cement, but is somewhat sensitive, and is therefore mixed with a small quantity of ground gypsum, the mixture being spread on a floor, left for about a week, and then turned and mixed.

Evaporating Liquids. E. Morterud, Torderod, near Moss, Norway. British Patent, 132,893, of 1918.

In apparatus for evaporating liquids, in which the vapours generated from the liquid are compressed and used for heating the liquid, the liquid is circulated through the heater A under pressure to avoid vaporisation, and is admitted in the form of spray to a separate evaporating-chamber E kept at a lower pressure. The vapours are withdrawn from the evaporator E by a perforated pipe L, and are compressed by a

pump M through a pipe K into the heater A. The liquid is led from the evaporator by a pipe H, is forced by a pump I through a pipe G to the heater A, and is returned by a perforated pipe D to the evaporator. A turbulent motion is imparted to the liquid passing through the pipes B of the heater by means of baffles T. The liquid entering the system is preheated in an exchanger N by means of condensate formed in the heater A.

Varnishes. R. Gilmour and W. Dunville and Co., Belfast. British Patent, 132,996, of 1918.

Lacquers or varnishes are prepared by dissolving cellulose nitrate or celluloid in *n*-butyl, or isobutyl formate to which may be added other solvents or diluents such as acetone, ethyl acetate, or amylacetate.

Recovery of Colloidal Materials. T. W. Barber, London. British Patent, 132,947, of 1918.

Colloidal matter is separated from its solutions by projecting the liquid against a surface, preferably after first saturating it with gas. The colloidal solution, after being brought to a temperature of about 60–70° F., is forced from the tank A by a pump B into a mixer D, where it is charged with air or other gas from the pump C. The liquid then

passes to a sprayer E, from which it is projected on to a plate F. The colloidal matter coheres and floats away by spout G², whilst the liquid is returned to the tank A for retreatment if necessary. The mixer D comprises a casing,

Fig. 2, in which is screwed a nozzle d³ provided with perforations d⁴, through which the gas entering at d² is forced into the liquid entering at d.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Tetrachlorethane. Compagnie des Produits Chimiques d'Alais et de la Camargue, Paris. British Patent, 132,757. Convention date, March 12, 1919.

In the production of tetrachlorethane by passing acetylene and chlorine through a contact mass consisting of iron turnings mixed with inert materials—*e.g.*, broken quartz,—the contact mass is constantly sprinkled with a portion of the tetrachlorethane produced. Using the apparatus shown, acetylene and chlorine are admitted by pipes C, B to the water-cooled reaction tube A containing iron turnings and broken quartz. The tetrachlorethane collects in vessel E, from which a suitable quantity is pumped through a cooler G to the pipe D, which sprinkles it continuously over the contact mass. A by-pass H serves to regulate the amount delivered by the pump.

Halogen Compounds. Chemische Fabrik Flora, Dubendorf, Switzerland. British Patent, 132,245. Convention date, August 31, 1918.

Bromo and chloro compounds are prepared by treating amines or aminocarboxylic acids with a mixture of hydrobromic or hydrochloric acid and nitric acid. Mixtures of bromides or chlorides with nitric acid, or of hydrobromic or hydrochloric acid with a nitrate may also be used. The amino group is thus replaced by the halogen. Examples are given of the preparation of *α*-chlor- or *α*-brom-isobutylic acid from leucine, and of chlor- or brom-succinic acid from aspartic acid; alanine is also specified as a parent substance.

Chloracetic Acid. Compagnie des Produits Chimiques d'Alais et de la Camargue, Paris. British Patent, 132,042. Convention date, May 4, 1918.

The production of chloracetic acid by the reaction of hot sulphuric acid upon trichlorethylene is rendered continuous by continuously supplying water to maintain the sulphuric acid at the proper concentration (about 90 per cent.) and removing the chloracetic acid as formed by means of an excess of trichlorethylene vapour. In the apparatus shown, trichlorethylene vapour from a boiler A bubbles through sulphuric acid in the vessel D; the escaping vapours (trichlorethylene, chloracetic acid, steam) and hydrochloric acid gas pass off by pipe F to a reflux condenser G; the condensate flows to the decanting-vessel M, where it separates into aqueous chloracetic acid which flows into vessel N and a mixture of chloracetic acid and trichlorethylene which is returned to the boiler A. The contents of the vessel N are added to the vessel O, which continuously supplies water to the vessel D. The chloracetic acid flows off from the boiler A to a similar boiler S, in which it is further freed from trichlorethylene, and passes to a container U. From the reflux condenser G the escaping hypochlorous acid gas passes to a tower I, in which it is washed with cold trichlorethylene to free it from chloracetic acid, and then passes to a second tower K, in which it

is condensed by cold water, the resulting liquid flowing to a decanting-vessel L in which the trichlorethylene is separated from the aqueous hydrochloric acid. The tower I is fed with trichlorethylene from a vessel Y and also from a condenser X which leads from a branch V of the pipe B. The reaction is carried out at 160-190° C.

Evaporating Solutions. P. Piccard, Geneva. British Patent, 132,771. Convention date, September 14, 1918.

Relates to an apparatus for evaporating saline solutions in which the solution is circulated by a pump *c* through heaters *b*, maintained under pressure, and an evaporator *a*, in which the solution as it enters by a nozzle *d* is subjected to a sudden reduction of pressure. The invention consists in causing the jet of solution entering the evaporator to impinge on a solid body *e* so that the salt crystals adhere to its surface and grow thereon until they are removed. The solid body *e* may be a rotary cylinder provided with a stationary scraper *f* for removing the deposited crystals. Alternatively, a rotating disc may be used, or a stationary solid body with a moving scraper. A U-shaped evaporator is preferably used to provide for the deposition of crystals remaining suspended in the solution.

Fatty Acids. Pardubitzer Fabrik der Akt.-Ges. für Mineralöl-Industrie vorm. D. Fanto and Co., Pardubitz, Austria. British Patent, 131,301. Convention date, September 2, 1916.

Fatty acids are obtained by prolonged passage of air, or other oxygen-containing gas, through paraffin wax; a temperature below 150° C.—say, 115-125° C.—is employed. When the reaction has started, the air supply may be regulated so that the heat of reaction is sufficient to keep the temperature constant. The reaction may be accelerated by adding to the charge a portion of previously oxidised paraffin wax. Apparatus for use in carrying out the process is described. The products can be used as substitutes for vegetable or animal fatty acids; the volatile acids may be converted into esters for perfumery. Prolonged passage of air at higher temperatures gives a brown rubbery mass, suitable for use in making varnishes.

NEW COMPANIES.

Corbacoral Mines, Ltd.—Capital £50,000... 5s. shares. Object: To prospect for, work and develop gold, platinum, lead, tin, wolfram, silver, coal, copper, iron and other mines, mineral, oil, and other rights and properties in West Africa or elsewhere, etc. Solicitors: Mayo, Elder and Co., 10, Drapers Gardens, E.C.

Bathgate Polish and Chemical Company, Ltd.—Private company. Capital £2,000., £1. shares. Registered office: Engine Lane, Bathgate.

South African Coal By-Products, Ltd.—Capital £6,000.. in 4,000 preference shares of 5s. each and 100,000 deferred shares of 1s. each. Registered office: 790-792, Salisbury House, E.C.

Clarendon Manufacturing and Engineering Company, Ltd.—Private company. Capital £5,000., in 3,000 preference shares of £1. each and 40,000 ordinary shares of 1s. each. Do-tinners, de-galvanisers, and de-enamellers, tin terne and black plate manufacturers, etc. Solicitor: R. A. Kendrick, 69, Park Street, Camden Town, S.W.

Everlasting Flooring Company, Ltd.—Private company. Capital £2,000., £1. shares. Manufacturers, importers, and exporters of, agents for, and dealers in metallic powder used in the process of rendering hard or non-porous the foundations, floors and pavements, buildings, etc. Registered office: 8, St. James' Street, Piccadilly, S.W.

Safety Celluloid Company, Ltd.—Capital £200,000., £1. shares. Object: To take over all or part of the undertaking and assets of the Safety Celluloid Company, Ltd. (in liquidation). Registered office: Abbey Road, Park Royal, Willesden, N.W. 10.

Regina Trading Company, Ltd.—Private company. Capital £25,000., £1. shares. Seed crushers, margarine and oil manufacturers, cake manufacturers, soap boilers, cattle food manufacturers, etc. Registered office: Mark Lane Station Buildings, E.C.

Moore, of Trafford Park, Ltd.—Private company. Capital £50,000., £1. shares. Object: To take over the business carried on by S. Moore at Westinghouse Road, Trafford Park, Manchester. Manufacturers, importers, and exporters of and wholesale and retail dealers in all kinds of dyes, dyestuffs, chemicals, drugs, paints, varnishes, etc. Solicitor: P. J. Sketton, 90, Deansgate, Manchester.

Herts Benzol Company, Ltd.—Private company. Capital £15,000., £1. shares. Registered office: Waters Hill, Hemel Hempstead, Herts.

CORRESPONDENCE.

***We do not hold ourselves responsible for the opinions expressed by our correspondents.*

New Vacuum Dryers.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—We have received several complaints from clients in connection with two advertisements in your journal under the above heading, replies to be addressed to "Box X.A." and "Box E.E.F." For some reason or other they have concluded that the advertisements are ours.

These advertisements offer new vacuum dryers, of American make, for spot delivery, and clients have assumed that they refer to Devine dryers.

We wish to point out that we are in no way associated with the advertisers or advertisements. Devine dryers are advertised by us every week in *The Chemical Trade Journal and Chemical Engineer* over our own name, and not in Box No. advertisements.

Where clients mention this matter to us, we are able to refute any connection with the advertisements, but as we are not always informed, we feel compelled to issue this disclaimer. We shall be glad if you will kindly insert the half-page official announcement we enclose herewith, in which you will notice we specially draw attention to the fact that we are the only authorised representatives of the J. P. Devine Company for Europe and the British Colonies, and that all advertisements in regard to their specialities bear our name and head office address.—Yours, etc.,

(FOR JAMES LIVINGSTON, LTD.)

White Lead and Zinc Oxide Pigments.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—We have a copy of your publication issue of September 27, 1919, on page 327 of which is an article by James Scott, entitled "Some Microscopical Features of White Lead." In one paragraph Mr. Scott writes as follows:—

The best white lead only needs from 11 to 15 parts of linseed oil to render it a satisfactory pigment. White lead paint does not eventually crack in the manner that zinc white and baryta white paints are liable to do. It is believed by many chemists that this admirable trait is due to the saponification of the white lead by the oil used in it; lead linoleate thereby forming.

While we recognise that, as we are outsiders, perhaps we should not presume to criticise editorial matter that appears in your publication, we feel that you, as publishers, will accept such criticism in a co-operative spirit.

When Mr. Scott states that "white lead paint does not eventually crack in the manner that zinc white and baryta white paints are liable to do," he is omitting amplification that leaves rather a misleading thought. This is so because neither we as manufacturers of zinc oxide, nor any other zinc-oxide manufacturers, recommend the use of zinc oxide exclusively in the manufacture of paints. We do, however, urge the use of zinc oxide with white lead in suitable proportions as the proper mixture of pigments wherein the very highest quality of paint can be produced. This overcomes cracking, and also reduces to a minimum chalking of paint, which is so common when white lead alone is used as a pigment. In other words, a suitable combination of zinc oxide and white lead overcomes the faults, if you please to call them such, of either one or the other of these pigments.—Yours, etc.,

C. A. STEDMAN,

THE NEW JERSEY ZINC COMPANY.

New York, November 6, 1919.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Elstree Chemical Works, Ltd.—Registered November 11, £1,000. debts. balance of £15,000.; general charge.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

British Salicylates, Ltd., London, E.C.—Proofs for intended dividend to H. de V. Broughton, 33, Carey Street, W.C., liquidator, by December 2.

Colnbrook Chemical and Explosives Company, Ltd., London, S.W.—1st meeting of creditors, Bankruptcy Court, November 25.

Petrol Process Syndicate, Ltd., London, E.C.—Proofs for intended dividend to H. E. Burgess, 33, Carey Street, W.C., liquidator, by December 2.

Safety Celluloid Company, Ltd.—Claims to W. Barton, Abbey Road, Park Royal, N.W. 10, liquidator, by December 15.

Transparent Glue Company, Ltd., Middlesbrough.—C. Chipchase ceased to act as receiver November 3.

Union Chemical Company (Walcden), Ltd.—Proofs for intended dividend to J. G. Gibson, Byrom Street, Manchester, Official Receiver and liquidator, by November 26.

COMING EVENTS.

The Technical Inspection Association.—Meeting, rooms of the Society of Arts, John Street, Adelphi, **Friday, December 5, 7.30 p.m.** Paper: "Inspection and Testing of Materials," by Messrs. R. D. Summerfield and H. J. Davey.

Chemical Engineering Group (Society of Chemical Industry).—Conference, **Monday, December 15, Newcastle-on-Tyne**, on "The Transport and Distribution of Liquids in Chemical Works."

Society of Chemical Industry (Manchester Section).—Meeting, Grand Hotel, **Friday, December 5, at 7 p.m.** Papers: "The Activated Sludge Process of Sewage Purification," by E. Arden, D.Sc.; "A New Method for Determining the Relative Temperatures of Spontaneous Ignition of Coal: the Influence of Degree of Fineness and Volatile Matter on the Results," by Captain F. S. Sinnatt and Mr. Burrows Moore.

Society of Chemical Industry (London Section).—Meeting, Burlington House, **Monday, December 1, at 8 p.m.** Papers: "The Technical Applications of Ethyl Chloride," by A. Henning; "The Influence of Impurities in Lead when it is Heated with Concentrated Sulphuric Acid," by C. E. Barrs.

The Chemical Society.—Meeting, Burlington House, **London, Thursday, December 4, at 8 p.m.** Papers: "Di-phenanthryl," by H. Henstock; "A New Sulphuretted Hydrogen Generator," by B. D. Steele and H. G. Denham.

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d., naked; pure, 3s., naked, at works. Carboic acid, crude, 60%, East and West Coast, nominally 1s. 7d. to 1s. 8d.; crystals, 39-40%, 3½d. to 9d., f.o.b. Crude tar, London, 45s. to 50s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Refined tar, 32s. 6d. per barrel. Pitch, 80s.; East Coast, 70s. to 75s., f.o.b.; West Coast, 62s. 6d. to 65s., f.a.s. Solvent naphtha, naked, London, 90-190%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 95-160%, naked, London, 2s. 6d.; North, 2s. 4d. to 2s. 5d. Crude naphtha, naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthaline, £16. to £18.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 5½d.; heavy oil, 6½d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 7d. to 2s. 8d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: home trade, November £20. 15s., basis 24½%. Nitrate of soda, £22. 10s. to £22. 15s.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of soda is dearer, and the quotation on spot for 95/96% quality has been advanced to £20. 12s. 6d. per ton net cash, f.o.r., prompt delivery. East Indian bone meal: There is no change to report in this market, the quotation for November-December shipment being £17. 10s. per ton, whilst that for January-February shipment is £15. per ton, net cash, ex ship Liverpool, for 4½% ammonia and 52% phosphates. On spot Liverpool, holders ask £17. 10s. per ton, net cash, for 4½% and 45% quality. Mineral phosphates are without alteration, and values at present are only nominal. Dried blood scarce, the value being about 5s. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £95. 10s. to £95. 15s., cash; £97. to £97. 5s., three months; electrolytic, £109. to £112. **Tin:** Standard, £295. 5s. to £295. 10s., cash; £296. 15s. to £297. three months; Straits, £295. 5s.; English, £293. to £294. **Lead:** Soft foreign, £36. 5s.; English, £37. 10s. **Spelter,** £48.; hard, £33. to £34. **Antimony,** English regulus, 90%, £47. 10s. **Aluminium,** £150. **Nickel,** £215., ex warehouse. **Quicksilver,** £17. 5s. to £17. 10s. **Bismuth,** 12s. 6d. **Platinum,** 442s. per oz. **Wolfram,** 32s. 6d. per unit.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplates in steady request, with quotations very firm on the basis of 45s. 6d. per standard box, f.o.b. Copper firmer, with better business passing at £98. 15s. prompt and

£100. 15s. three months. Tin prices are strong, and the metal is in better request at £288. 15s. early delivery and £290. 10s. three months. Lead active, with orders over a period at £36. 15s. per ton and £37. prompt; English, £37. 15s. **Spelter** firm, with fair business at £47. 10s. per ton delivery over December. Zinc sheets in good inquiry, with English steady at £67. and American £68., f.o.b. New York. **Antimony,** English regulus 90%, £47. 10s. prompt; foreign, £44., c.i.f. **Aluminium** very steady, and good business passing at £150. per ton. **Quicksilver** dearer at £17. 15s. per bottle. **Nickel** more active at £205. delivered London, or equal. **Sulphate of copper** remains very quiet but steady at £41. per ton, in casks, less 5%, f.o.b. **Sulphate of ammonia** steady at £20. 15s. per ton prompt and £21. forward. **Nitrate of soda** steady at 21s. 6d. per cwt., in bags. **Palm oil** quiet and steady: Lagos, £88.; softs, £87. 10s.; Benin, £86.; and hards, £85. **Turpentine,** £6. 8s. per cwt. **Oxalic acid** very quiet at 1s. 0½d. per lb. **Arsenic** quiet at £60. per ton for white powdered, in bags, f.o.b. Pitch in better supply and rather easier at 62s. 6d. at ship. **Bone meal** 17s. 6d. per cwt. **Copperas** more active from £3. 10s. upwards, according to delivery.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on November 22 were: American, 30,545 barrels, compared with 2,962 barrels at the corresponding date of 1918; French, 716 barrels (751 barrels); and Spanish, 297 barrels (1,081 barrels). Deliveries during the week ended November 22 were 2,051 barrels, against 573 barrels last year; and since January 1, 67,816 barrels, compared with 23,034 barrels in 1918. The price on Saturday last was 126s. per cwt., compared with 103s. at the corresponding date of last year. January-April (1920) delivery was quoted at 128s. 9d., and May-August 116s.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

Business in heavy chemicals continues good, and values all round are well maintained with an upward tendency. Demand for caustic soda is very strong, and £27. is asked for resale lots of 70%. Refined bicarbonate of soda is scarce at £11. 5s. 58% alkali at £10. 15s. per ton. Contract quotations for home trade remain unaltered. Bleaching powder in short supply at £17. per ton on rails. Chlorate of soda easy at 5½d. per lb. Potash 1s. per lb. Supplies of bichromate soda are scarce and price firm at 10½d. for spot parcels. Recovered rock sulphur £17. on rails. For sulphate of copper the demand continues quiet, and price nominally £40. per ton f.o.b. Nitrite of soda dearer at £62. basis 100%. Concentrated sodium sulphide higher at £24. per ton. Phosphate £29. per

ton. Commercial hyposulphite, £18. 10s. per ton. Supplies of white powdered arsenic continue scarce, and price of Cornish brands firmly held at £65. per ton. Yellow prussiate of potash has been advanced to 2s. 1d. per lb., but there is only small inquiry. Prussiate of soda steady at 1s. 1d. per lb. Acetic acid in good request, and makers are well engaged with orders. Acetate of soda unchanged at £48. per ton. Lead salts are quiet, but quotations unchanged at recent rates. English brown acetate of lime has been advanced to £14. 10s. per ton and grey £20. per ton. Miscible naphtha, 10s. 6d. per gallon. Oxalic acid is firmer at 1s. 1½d. to 1s. 2d. per lb., carriage paid according to quantity.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

Business in chemicals has again been active, the demand on home trade account having been well maintained, and more inquiries having been made on export account. The shortage of stocks of some articles much in demand continues, and manufacturers are having inconvenience over apportioning such supplies as they have, and over arranging for the distribution of such as they are likely to have within the next two months. This condition is making an opportunity for fresh offerings of American products, but the prices quoted for them are high, so that a very limited business has been done in them. Bleaching powder has been in somewhat freer inquiry, and in still in short supply. For home trade uses, £17. per ton, free on rail or conveyance, in buyers' packages; and for export £15. to £18. per ton is being quoted. Chloride of calcium has been in fair demand, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has been much in demand. Prices are £24. per ton for 76%, £22. per ton for 70—72%, and £21. per ton for 60%. Nitrate of soda has been more inquired for, and is £21. to £22. per ton. Saltcake has sold more readily, and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have again sold freely. The price is £5. 10s. per ton, in 2cwt. bags, f.o.r., at works. Bicarbonate of soda has been in fairly active demand, and is £8. 5s. to £10. per ton, according to terms of delivery. Borax has been steadily called for, and is £39. per ton for ordinary and £40. per ton for powdered, in bags, less 3% for lots of not less than 50 tons. Ammonia alkali has again been in good request, but has been in very short supply. It is £6. 10s. to £6. 15s. per ton, f.o.r., at works. Hyposulphite has been in moderate request, and is £18. 10s. per ton for ordinary and £22. per ton for pea crystals, in 1cwt. kegs. Sulphite of sodium has been more inquired for, and is £10. per ton for ordinary and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been in fair demand, and is £22. per ton in casks and £23. per ton in drums. Prussiate of soda has been in quietly steady request, and is 1s. per lb. Bichromate of soda has sold more readily, and is 9½d. per lb. Phosphate has been in fair demand, and is £27. per ton. Chlorate of potash has been in moderate request, and is 1s. to 1s. 1d. per lb. Permanganate has had a limited sale, and is 3s. 6d. per lb. Sulphate of potash has moved but slowly, and is £25. per ton. Carbonate of potash has again had a moderate sale, and is £95. to £100. per ton for 80—85%. Caustic potash has been steadily called for, and is £120. per ton. Nitrate of potash has been more in request, and the price has hardened. Refined is from £60. to £62. per ton, and ordinary £40. per ton. Canadian potashes have been very quiet. First quality Montreal are £200. to £220. per ton, and second quality £190. to £210. per ton. Bichromate of potash has been rather more in request, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has met with a fair inquiry, and is 1s. 9d. to 1s. 10d. per lb. Sal ammoniac has been in quietly steady demand, and has been scarce. Prices have been advanced. First quality lump is £95. per ton, second quality is £90., and crushed £5 per ton extra. Sulphate of ammonia has moved but slowly, and stocks in hand have been very small. Prices are £21. per ton for December, £21. 7s. 6d. for January (1920), £21. 15s. for February, and £22. per ton for March to May (1920). Carbonate of ammonia has been rather more in request, and is 6½d. per lb. Muriate has been but little called for, and is £45. to £50. per ton, according to grade. Magnesia has had a moderate sale. Carbonate is £2. 5s. per cwt., and sulphate £11. to £16. per ton. Alum has been in good request, and is still scarce. The price for the home trade is £18. 10s. per ton. For export, £18. 10s. to £19. 10s. per ton is quoted. Aluminoferric has been quiet, and is £8. 10s. to £12. per ton. Sulphate of alumina has been in moderate request, and is £12. to £17. per ton, according to grade. Sulphur has been well inquired for. English flowers are £32. per ton; roll is £28. per ton; and rock £22. per ton, in bags, f.o.r. Sicilian

grades are: Flowers, £28. per ton; roll, £22. 10s. per ton; and rock £17. 15s. per ton. Cream of tartar has been in improved demand, and is slightly dearer. From £12. 10s. to £13. per cwt., according to test, is being quoted. Tartaric acid has been steadily called for, and is 3s. to 3s. 2d. per lb. Boracic acid has been rather more in request. Crystals are £72. per ton, and powdered is £74. per ton; £2. to £3. extra being charged for casks. Oxalic has had a moderate sale, and is 1s. 2d. to 1s. 3d. per lb. Citric acid has been in quietly steady demand, and is 4s. 3d. per lb. White acetate of lead has been but little called for, and is £83. to £85. per ton. Arsenic has been more in request, and has been in short supply. Prices have been irregular. White powdered is from £60. to £63. per ton. Sulphate of copper has been in somewhat better request. For the home trade, £42. per ton is quoted, and for export £42. to £43. per ton, less 5%, in casks, f.o.b., at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Market continues very steady, and the inquiry both for home and export is well maintained, caustic soda and bleaching powder being in good request. Locally soda crystals are firm, and in demand at £5. 10s. per ton, 2cwt. bags. Sulphur still very scarce. The following prices are per ton, net: Bleaching powder, softs and hards, £17.; caustic soda, 76—77%, £25.; do., 74—76%, £24.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £23. 10s.; hyposulphite of soda, 5—7cwt. casks, £19.; do., 1cwt. kegs, £20.; sulphite of soda, 5—7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda, saltcake, in bulk, £4.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60—62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market is very firm, and, with a substantial arrival of tonnage over the week-end and good forward prospects, trade is extremely brisk. Export quotations are as under: Best Northumberland steam, 95s. to 100s. per ton; do., seconds, 90s. to 95s.; Northumberland small coals, 75s. to 80s.; do., seconds, 70s. to 72s. 6d.; best Durham gas coals, 80s. to 85s.; do., seconds, 65s. to 75s.; Durham bunker coals, 70s. to 80s.; do., seconds, 60s. to 65s.; foundry coke, 100s.; gas coke, 95s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

During the past week there has been a noticeable tendency towards increased business, and some very important orders are reported, with the anticipation that this state of affairs will continue for some time. Prices are kept at a firm level, and several articles are again to the dear side, such as chlorate of potash (which has advanced from 1s. 1d. to 1s. 2d. per lb.) and saltpetre (which has advanced from £3. 2s. to £3. 4s. per cwt.) Quotations at the moment of writing are as follows: Arsenic, £64. per ton, net, Glasgow; bicarbonate of soda, £10. 10s. and £12. 10s. per ton for 6-8cwt. casks and 1cwt. kegs. net, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags; and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £25. per ton, net, Glasgow; chlorate of potash, 1s. 2d. per lb., net, Glasgow; chlorate of soda, 8d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 98%, £12. per cwt., net, Glasgow; paraffin wax, U.K. deliveries, 125°, 6½d. to 6½d.; 121-3°, 5½d. to 5½d.; 118-20°, 5d.; 110-12°, 4d. to 4½d.; and 98-102°, 4d. to 4½d.; sal ammoniac, £95. and £85. per ton, net, any port, for first and second lump respectively; sal ammoniac crystals, £70. per ton, net, Glasgow; saltpetre, £3. 4s. per cwt., net, Glasgow; tartaric acid, 3s. 3d. per lb., 5%, Glasgow.

Among the sea oils there is also considerable activity, but prices are more or less maintained at the level of the past few weeks. Whale oils are selling at the old prices of 94s. for pale and 76s. for brown; but black variety has stiffened to 75s., as against 74s. previously. Yellow is still unobtainable. Other prices are Newfoundland cod at 80s.; pale seal at 96s.; and Menhaden at 80s., and everything on offer is quickly finding buyers.

In the coal trade the demand is still greater than the supply and, both from the household and from the industrial point of view, inquiry is very brisk. Fuel as it comes to the pithead is quickly allocated, and there is never any surplus.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending November 30.

BARIUM SULPHATE—
Antwerp, 200 bgs.

DYESTUFFS—
Myrabolan Extract
Calcutta, 816 bgs.
Myrabolans
Calcutta, 3,072 pkts.

GLUE—
Antwerp, 60 pkgs.

MAGNESITE—

POTASSIUM TARTRATE—
Christiania, 20 lbs., \$2.

SALAMMONIAC—
Bahia, 5 c., \$21.; Barcelona, 3 t. 19 c., \$281.; Bombay, 3 t. 15 c., \$265.; Galatz, 5 t., \$290.; Naples, 2 t., \$170.; Rio de Janeiro, 1 t., \$82.; Serbia, 1 t. 19 c., \$141.; Piraeus, 9 c., \$36.; Smyrna, 3 t., \$192.

SALT—
Newcastle, 500 t.; Norrköping, 250 t.; Okopedi, 60 t.; Onitsha, 89 t.; Opela, 35 t.; Pt. Harcourt, 40 t.; Sapele, 4 t.; Sherbro, 25 t.; Stockholm, 20 t.; Sierra Leone, 50 t.; Trondhjem, 140 t.; Victoria, W.C.A., 3 t.; Warri, 145 t.; Wellington, 64 t.

SALTPETRE—
Buenos Ayres, 1 c., \$3.; Elmina, 1 c., \$3.; Vigo, 3 t. 14 c., \$184.

SHEEP DIP—
Belize, 5 c., \$16.; Buenos Ayres, 166 t. 5 c., \$8,136.; Falklands, 3 t. 12 c., \$240.; La Cerba, 19 c., \$65.; La Guaira, 12 c., \$41.; Talcahuano, 3 t. 9 c., \$200.

SILVER NITRATE—
Tammerfors, 2 qrs., \$93.

SOAP—
Accra, 50 bxs., 127 cs.; Aden, 27 cs.; Algiers, 1,535 cs.; Alexandria, 250 bxs., 335 cs.; Amboina, 100 cs.; Amoreang, 200 bxs.; Amsterdam, 150 cs.; Ampenam, 100 bxs.; Antofagasta, 36 cs.; Antwerp, 4,500 bxs., 4,882 cs.; Arica, 100 cs.; Auckland, 9 bxs., 45 cs.; Balik Pappan, 156 bxs.; Barcelona, 3 bxs.; Barbados, 750 bxs., 1,900 cs.; Bas Konolon, 38 cs.; Basra, 150 bxs.; Batavia, 225 cs.; Bathurst, 40 bxs., 3,904 cs.; Belawan Deli, 600 bxs.; Belize, 7 cs.; Benoa, 150 bxs.; Beyrouth, 25 cs.; Bolleleng, 100 bxs.; Bombay, 428 cs.; Bonny, 250 bxs.; Bordeaux, 2,050 cs., 6 brls.; Buenos Ayres, 1,259 cs.; Cape Town, 100 bxs.; Calcutta, 4 bxs.; Christiania, 6,846 cs.; Colombo, 22 bxs.; Colon, 101 cs.; Constantinople, 1,279 cs.; Copenhagen, 120 cs.; Dongalla, 100 bxs.; Dakar, 50 cs.; Delhi, 10 cs.; Galatz, 640 bxs., 4,018 cs.; Genoa, 1,210 bxs., 751 cs.; Gibraltar, 7 bxs., 628 cs.; Hong Kong, 500 bxs., 1 cs.; Hamburg, 30 cs.; Helsingfors, 2,500 bxs., 326 cs.; Iquique, 1 cs.; Las Palmas, 50 bxs., 224 cs.; Marseilles, 2,000 cs.; Macassar, 850 cs., 500 bxs.; Marinique, 898 cs.; Menada, 725 cs., 1,000 bxs.; Monte Video, 50 cs.; Nantes, 2,000 cs.; Nelson, N.Z., 10 bxs.; Oporto, 155 cs.; Oran, 3,605 bxs.; Padang, 410 bxs.; Panama, 100 bxs.; Paris, 10 bxs.; Penang, 9 cs., 18 bxs.; Pt. Said, 1,110 bxs.; Pt. au-Prince, 5 bxs.; Porto Novo, 2 bxs.; Pt. Sudan, 2 bxs.; Quittah, 1 bx.; Rabat, 100 bxs.; Reval, 60 bxs.; Rio de Janeiro, 5 bxs.; Rotterdam, 60 bxs.; St. Kitts, 180 pgs.; St. John's N.F., 130 bxs.; St. Louis, 100 pgs.; St. Vincent, 150 bxs.; Samarang, 40 bxs.; Samarinda, 725 pgs.; San Fernando, 10 pgs.; Santos, 3 bxs.; Sassandra, 75 pgs.; Secondee, 3 cs., 600 bxs.; Sherbro 24 pgs.; Stamboul, 29 pgs.; Surinam, 50 pgs.; Talcahuano, 135 cs.; Tangiers, 150 bxs.; Teneriffe, 50 bxs., 75 cs.; Trondhjem, 20 bxs., 10 brls.; Varna, 1,526 cs.; Valencia, 20 cs.; Velo, 15 cs.; Valparaíso, 300 cs., 100 drms.; Vera Cruz, 1 cs.; Vigo, 40 cs.; Vladivostok, 32 bxs.; Winneba, 2 cs.; Wellington, 5 bxs.; Yokohama, 12 bxs., 8 cs.

SODA ASH—
Adelaide, 50 pgs.; Auckland, 125 pgs.; Bari, Italy, 451 pgs.; Buenos Ayres, 482 pgs.; Calcutta, 1,600 pgs.; Karachi, 400 pgs.; Kobe, 15,315 pgs.; Melbourne, 247 pgs.; Moji, 1,682 pgs.; Padang, 50 pgs.; Patras, 300 pgs.; Rio de Janeiro, 380 pgs.; Samarang, 340 pgs.; Santos, 722 pgs.; Shanghai, 3,010 pgs.; Stockholm, 2,200 pgs.

SODA CRYSTALS—
Karachi, 100 pgs.; Madras, 300 pgs.; Piraeus, 127 pgs.; Singapore, 28 pgs.

SODIUM BICARBONATE—
Adelaide, 184 pgs.; Bari, Italy, 155 pgs.; Brisbane, 214 pgs.; Calcutta, 350 pgs.; Christiania, 290 pgs.; Copenhagen, 250 pgs.; Galatz, 50 pgs.; Madras, 500 pgs.; Moji, 215 pgs.; Perth, 67 pgs.; Penang, 20 pgs.; Salónica, 100 pgs.; St. John's N.F., 200 pgs.; Santos 20 pgs.; Sao Paulo, 20 pgs.; Tammerfors, 10 pgs.; Timaru, 20 pgs.

SODIUM SILICATE—
Calcutta, 64 pgs.; Christiania, 10 pgs.; Genoa, 135 pgs.; Kobe, 193 pgs.; Lisbon, 65 pgs.; Melbourne, 87 pgs.; Nantes, 100 pgs.; Para, 30 cs.; Piraeus, 120 pgs.

SODIUM SULPHATE (GLAUBER SALTS)—
Secondee, 1 c., \$6.

SODIUM SULPHIDE—
Abo 3 c., \$4.; Nantes, 4 t. 18 c., \$111.

STRONTIUM NITRATE—
Seville, 1 c., \$6.

SULPHUR—
Abo, 10 c., \$5.; La Guaira, 1 t., \$30.; Maceio, 4 c., \$10.; Secondee, 2 c., \$3.; Tammerfors, 2 t., \$60.

SULPHURIC ACID—
Natal, 8 c., \$16.; Rio de Janeiro, 4 c., \$36.

TALLOW—
Marseilles, 21 brls.; Neuss, 30 cs.

TANNIC ACID—
Antwerp, 2 t., \$223.

TAR (SWEDISH)—
Monte Video, 2 t., \$88.

TARTARIC ACID—
Karachi, 1 t. 1 c., \$346.; New York, 1 t. \$328.; Oporto, 1 c., \$11.

TIN CRYSTALS—
Montreal, 15 c., \$154.

WOOD TAR—
Alexandria, 1,140 gals. \$175.

WOOD PRESERVATIVE—
Bilbao, 4 t. 16 c., \$80.; Kingston, 1 t. 2 c., \$22.

ZINC CHLORIDE—
Samboe, 5 t. 5 c., \$278.

LONDON.

Week ending November 19.

ACETANILID—
Amsterdam, 1 ck., \$46.; Antwerp, 1 ck., \$40.; Bangkok, 1 cs., \$63.; Calcutta, 1 cs. (pt.), \$9.

ACETIC ACID—
Alexandria, 1 brl., \$12.; Auckland, 9 cs., \$24.; Amsterdam (F.), 3 cs., \$40.; Fremantle, 2 cs., \$5.; Hamburg, 2 cs., \$8.; Lisbon, 2 cs., \$10.; Paris, 12 cs., \$167.; Rio de Janeiro, 16 cs., \$66.; Rotterdam (F.), 6 cs., \$80.; Wellington, 4 cs., \$14.

ACETO SALICYLIC ACID—
Bangkok, 1 cs., \$131.; Brisbane, 1 cs. (pt.), \$13.; Genoa, 1 cs., \$30.; Gothenburg, 10 cs., \$225.

ACETONE—
Barcelona, 2 drms., \$56.; Rotterdam, 1 dr., \$28.

ALUM—
Adelaide, 2 c., \$9.; Amsterdam, 1 kg., \$6.; Barbados, 5 c., \$9.; Delagoa Bay, 5 c., \$8.; Florianopolis, 6 c., \$9.; Mollendo, 5 c., \$7.; Nantes, 4 t. 18 c., \$115.; Pernambuco, 5 c., \$9.; Wellington, 5 c., \$6.

AMMONIA—
Accra, 6 cs., \$11.; Calcutta, 5 cs., \$10.; Delagoa Bay, 6 cs., \$12.; Durban, 20 cs., \$39.; Piraeus, 4 drms., \$14.; Rangoon, 5 cs., \$10.; Santos, 4 cs., \$16.; Valparaíso, 5 cs., \$9.

AMMONIUM ACETATE—
Bombay, 1 cs., \$5.

AMMONIUM BROMIDE—
Auckland, 1 cs., \$16.; Bombay, 1 cs., \$20.; Sydney, 2 cs. (pt.), \$17.

AMMONIUM CARBONATE—
Bangkok, 17 c., \$98.; Beyrouth, 1 c., \$6.; Florianopolis, 8 c., \$43.; Guayaquil, 4 c., \$20.; Mollendo, 1 c., \$5.; Penang, 13 c., \$76.; Pt. Swettenham, 4 c., \$22.; Rio de Janeiro, 2 t. 3 c., \$224.; Singapore, 11 c., \$67.

AMMONIUM CITRATE—
Calcutta, 1 cs., \$14.

AMMONIUM CHLORIDE—
Antwerp, 50 pgs., \$285.; Cape Town, 2 kgs., \$8.; Galatz, 7 kgs., \$130.

AMMONIUM FLUORIDE—
Durban, 3 drms., \$28.

AMMONIUM HYDRATE—
Lytleton, 1 cs. (pt.), \$6.; Sydney, 1 cs. (pt.), \$9.

AMMONIUM MOLYBDATE—
Cape Town, 1 cs. (pt.), \$10.

AMMONIUM MURIATE—
Antwerp, 1 t., \$82.; Constantinople, 10 c., \$23.; Kobe, 4 t. 19 c., \$292.; Rouen, 3 t., \$225.; Wellington, 2 c., \$6.

AMMONIUM PERSULPHATE—
Durban, 8 cs., \$500.

AMMONIUM PHOSPHATE—
Algiers, 3 cs., \$53.; Barcelona, 1 t. 3 c., \$37.

AMMONIUM SULPHOCYANIDE—
Paris, 2 c., \$25.

AMYL ACETATE—
Brussels, 1 dr., \$15.; Hong Kong, 40 cs., \$70.

AMYL BUTYRATE—
Hong Kong, 2 cs., \$20.

ANTIMONY—
Rio de Janeiro, 11 c.

ANTIMONY REGULUS—
Calcutta, 10 c.

ANTIMONY SULPHIDE—
Antwerp, 12 brls., 1 ck., \$333.; Aracaju, 2 cs., \$5.; Bahia, 5 cs., \$12.; Dunkirk, 34 cs., \$529.; Malmo, 3 cs., \$100.; New York, 10 cs., \$454.; Paris, 5 cs., \$104.

ARSENIC—
Auckland, 5 c., \$16.; Bahia, 2 c., \$18.; Calcutta, 2 t. 5 c., \$318.; Fiji, 2 c., \$8.; Mazagan, 3 c., \$28.

BARBITONE—
Melbourne (F.), 2 cs. (pt.), \$10.

BARIUM CHLORIDE—
Oporto, 3 pgs., \$34.

BARIUM CHROMATE—
Rio de Janeiro, 1 ck. (pt.), \$8.

BARIUM CHROMATE—
Rio de Janeiro, 2 cs., \$45.

BENZOIC ACID—
Genoa, 1 ck., \$21.

BISMUTH—
Alexandria, 1 cs. (pt.), \$9.; Amoy, 1 cs. (pt.), \$7.; Bombay, 1 cs. (pt.), \$11.; Rotterdam, 1 cs. (pt.), \$34.

BISMUTH & ACETO SALICYLIC—
Novorossisk, 4 cs., \$300.

BISMUTH CARBONATE—
Christchurch, 1 cs. (pt.), \$87.; Genoa, 3 cs. (pt.), \$11.

BISMUTH CITRATE—
Christchurch, 1 cs. (pt.), \$11.

BISULPHITE OF LIME—
Wellington, 10 hds., \$39.

BISMUTH SALICYLATE—
Cape Town, 1 cs. (pt.), \$9.; Calcutta, 1 cs. (pt.), \$20.; Charkeff, 6 cs., \$280.; Genoa, 3 cs. (pt.), \$34.

BISMUTH SUBGALLATE—
Amsterdam, 1 cs., \$42.; Buenos Ayres, 1 cs., \$17.; Lisbon, 1 cs. (pt.), \$12.

BISMUTH SUBNITRATE—
Calcutta, 1 cs. (pt.), \$40.; Cape Town, 1 cs. (pt.), \$10.; Copenhagen, 10 cs., \$755.; Genoa, 3 cs. (pt.), \$169.; Lisbon, 1 cs. (pt.), \$26.; Rotterdam, 1 cs., \$46.

BISMUTH SUBSALICYLATE—
Pelotas, 1 cs. (pt.), \$22.

BORAX—
Amsterdam, 4 t., \$200.; Belgrade, 5 c., \$13.; Gefle, 5 t., \$195.; Genoa, 15 t., \$590.; Galatz, 10 c., \$21.; Gothenburg (F.), 1 t. 10 c., \$59.; Nantes, 1 t., \$50.; Rio de Janeiro, 15 c., \$36.; Rotterdam (F.), 4 t. 18 c., \$197.; Rotterdam, 19 t. 16 c., \$983.; Paris, 39 t. 19 c., \$1,560.; Teneriffe, 1 c., \$5.

BORIC ACID—
Bangkok, 5 c., \$28.; Bombay, 10 c., \$38.; Calcutta, 2 c., \$9.; Durban, 5 c., \$25.; East London, 10 c., \$38.

CALCIUM CARBIDE—
Accra, 20 drms., \$24.; Colombo, 1 t., \$24.; Galatz, 11 c., \$14.; Secondee, 17 c., \$21.

- CALCIUM CARBONATE**—
Bangkok, 10 cks., £50.
- CALCIUM CHLORIDE**—
Aden, 4 t. 5 c., £40.; Bordeaux, 6 t., £201.; Marseilles, 1 t. 10 c., £15.; Piraeus, 2 c., £8.; Port Swettenham, 1 t. 5 c., £63.
- CALCIUM HYPOPHOSPHATE**
Genoa, 1 cs. (pt.), £7.
- CALCIUM PHOSPHATE**
Rotterdam, 1 kg., £5.; Sydney, 1 ck., £16.
- CALCIUM SULPHIDE**—
New York, 1 cs., £25.
- CARBON (RIEFTORT)**—
Dieppe, 145 t., £788.
- CAUSTIC POTASH**—
Auckland, 1 cs. (pt.), £14.; Copenhagen, 9 drms., £375.
- CAUSTIC SODA**—
Penang, 8 c., £15.
- CERESINE WAX**—
Gothenburg, 1 t.; Sydney, 10 c.
- CHEMICALS (otherwise undescribed)**
Antwerp, 6 cs., £1,479.; Basra, 2 cs. (pt.), £48.; Bombay, 1 cs. (pt.), £20.; Buenos Ayres, 1 cs. (pt.), £15.; Calcutta, 2 cs., £20.; Colombo, 1 cs., £6.; Delagoa Bay, 6 cs., £17.; Florence, 6 drms., £24.; Lyttleton, 1 cs., £57.; New York, 8 kgs. (pt.), £181.; Rio de Janeiro, 1 ck., £21.; Sydney, 12 cks., £120.
- CHINA CLAY**—
Antwerp, 2 t.; Havre, 5 t.
- CHLORIDE OF LIME**—
Talcahuano, 13 c., £13.; Valparaiso, 19 c., £19.
- CHROME SULPHATE**—
Rotterdam, 1 ck., £15.
- CHROMIC ACID**—
Constantinople, 1 cs., £44.
- CITRIC ACID**—
Barbados, 1 cs. (pt.), £6.; Buenos Ayres, 5 t. 2 c., £2,192.; Durban, 2 c., £33.; Guayaquil (F.), 1 c., £27.; Pt. Elizabeth, 8 c., £224.; Rotterdam, 1 t., £448.; Sydney, 2 t., £869.; Valparaiso, 10 c., £226.
- COAL PRODUCTS**—
Accelerine
Italy, 1 cs., £47.
Alizarine
Barcelona, 1 kg., £7.; Dunedin, 3 kgs., £71.; Lyttleton, 5 pkgs., £202.; New York, 50 cks., £1,500.; Timaru, 3 cks., £126.; Wellington, 1 kg., £28.
Aniline Colour
Durban, 3 cs. (pt.), £44.; Paris, 1 ck., £55.; Pt. Elizabeth, 7 pks., £292.
Aniline Dye
Adelaide, 1 cs. (pt.), £26.; Bahia, 1 cs. (pt.), £15.; Auckland, 1 ck., £54.; Bombay, 4 pkgs., £66.; Brussels, 2 kgs., £42.; Buenos Ayres, 1 cs., £16.; Cape Town, 1 cs., £26.; Christchurch, 2 cs. (pt.), £39.; Cochinchina, 5 drms., £99.; Dunedin, 2 cs. (pt.), £108.; Lyttleton, 8 pkgs., £294.; Ostend, 5 pkgs., £74.; Rio de Janeiro, 1 cs., £8.; Shanghai, 3 cs., £61.; Wellington, 1 cs., £18.; Yokohama, 1 cs., £58.
Aniline Oil
Barcelona, 31 drms., £1,500.
Benzole
Durban, 50 drms., £125.
Betanaphthol
Rio de Janeiro, 20 cs., £260.
Carbolic Acid
Bahia, 2 cs., £11.; Bombay, 3 cs. (pt.), £7.; Durban, 25 drms., £21.; Halmstad, 85 cks., £780.; Hankow, 4 cs. (pt.), £12.; Rio de Janeiro, 2 cs., £8.; Rotterdam, 1 brl., £8.; Santos, 2 cs., £9.
Cresosote
Calais, 218 t., £1,845.; Demerara, 1 ck., £5.; Selzaete, 180 t., £1,004.
Dyes
Baltimore (F.), 2 drms., £117.; Bordeaux, 3 kgs., £86.; New York, 17 cks., £1,455.
- COAL PRODUCTS**—
Naphthalene
Aden, 30 cs., £65.; Bahia, 1 ck., £6.; Bombay, 4 cks., £66.; Durban, 6 pkgs., £17.; Paris, 15 drms., £250.
Nitrosine
Barcelona, 8 cks., £373.
Paranitraniline
Osaka, 180 kgs., £6,054.
Pitch
Alexandria, 600 brls., £461.; Antwerp, 246 t., £1,000.; Boulogne, 345 t., £1,150.; Belgium, 170 t., £680.; Calais, 954 t., £3,558.; Caen, 735 t., £2,900.; Cebu, 10 kgs., £6.; Constantinople, 23 cks., £33.; Dunkirk, 250 cks., £1,032.; Naples, 7 cks., £8.; Rotterdam, 1,640 t., £5,600.; St. Servan, 500 t., £2,000.
Pyridine
Durban, 50 drms., £119.
Tar
Beira, 20 rnlts., £52.
Malmö, 500 cks., £830.
Mauritius, 40 pkgs., £101.
- COPPERAS**—
Cape Town, 14 cks., £21.
- COPPER SUBOXIDE**—
Malmö, 6 drms., £60.
- COPRA ACID**—
Dunkirk, 30 brls., £550.
- CREAM OF TARTAR**—
Alexandria (F.), 1 c., £14.; Beira (F.), 1 cs. (pt.), £9.; Bombay (F.), 1 cs., £7.; Desterro, (F.), 2 c., £26.; Corinto (F.), 1 cs., £6.; Durban (F.), 2 c., £37.; Gothenburg (F.), 15 c., £200.; Guayaquil (F.), 1 c., £15.; Pt. Moresby (F.), 1 c., £13.; Townsville, 2 c., £27.; Auckland (transit) (F.), 1 t. 10 c., £990.; Brisbane (transit) (F.), 1 t., £180.; Dunedin (transit) (F.), 3 t. 10 c., £630.; Lyttleton (transit) (F.), 1 t. 5 c., £225.; Melbourne (transit) (F.), 22 t. 8 c., £32.; Sydney (transit) (F.), 1 t., £180.

Elizabeth, 1 c., £7.; Tientsin, 1 c., £7.
- GLYCEROPHOSPHATES**—
Alexandria, 1 cs. (pt.), £16.
- HYDROCHLORIC ACID**—
Bombay, 1 c., £5.; Jaffa, 1 t., £20.
- HYDROFLUORIC ACID**—
Calcutta, 1 cs., £5.
- HYDROGEN PEROXIDE**—
Kilindini, 1 cs., £8.
- IODINE**—
Genoa, 4 cs., £408.; Sao Paulo, 1 ck. (pt.), 1 cs. (pt.), £69.
- IODINE (RESUBLIMED)**—
Charkoff, 4 cs., £200.; Calcutta, 1 ck. (pt.), £26.; Durban, 1 ck. (pt.), £13.; Lisbon, 1 ck. (pt.), £17.; Shanghai, 2 cs. (pt.), 1 ck., £77.; Singapore, 1 cs. (pt.), £10.; Sydney, 1 cs., £31.
- IRON AND AMMONIUM CITRATE**
Santos, 1 cs. (pt.), £7.; Sydney, 4 cs. (pt.), £11.
- IRON GLYCEROPHOSPHATE**—
Rio de Janeiro, 1 ck. (pt.), £8.
- IRON HYPO**—
Genoa, 1 cs. (pt.), £7.
- IRON PERCHLORATE**—
Brussels, 1 kg., £12.; Santos, 1 cs., £6.
- KIESELGUHR**—
Bordeaux, 10 t., £180.
- LACTIC ACID**—
Cape Town, 4 pkgs., £77.; Madras (F.), 5 cks., £92.
- LEAD ACETATE**—
Bombay, 160 cs., £518.; Santos, 1 kg., £8.
- LEAD ARSENATE**—
Callao, 31 cks., £542.
- LEAD CARBONATE**—
Belgrade, 2 kgs., £8.
- LEAD SULPHIDE**—
New York, 7 cks., £71.; Paris, 2 cks., £42.
- LITHIUM CARBONATE**—
Boulogne (F.), 2 cks., £216.
- LITHIUM CARBONATE & BENZOATE**—
Paris, 4 cs., £310.
- MAGNESIA**—
Melbourne, 5 cs., £18.
- MAGNESIA (CALCINED)**—
Bahia, 1 cs., £19.; Rio de Janeiro, 2 cs., £40.; Sao Paulo, 3 cs., £50.; Santander, 2 cs., £52.; Santos, 4 cs., £37.; Sydney, 1 cs., £6.
- MAGNESIUM CARBONATE**—
Christchurch, 1 ck., £10.; Durban, 2 cs. (pt.), £5.; Launceston, 2 cs., £6.; Rio de Janeiro, 10 cs., £81.; Sao Paulo, 3 cs., £50.; Santos, 18 cs., £134.; Sydney, 1 cs., £5.
- MAGNESIUM CITRATE**—
Bangkok, 2 cs., £16.; Beyrout, 1 ck. (pt.), £9.; Malaga, 5 cs., £90.; Sydney, 10 cs., £79.; Wellington, 1 cs., £21.
- MAGNESIUM GLYCEROPHOSPHATE**—
Auckland, 1 cs. (pt.), £6.
- MAGNESIUM HYPOPHOSPHATE**—
Genoa, 1 cs. (pt.), £8.
- MAGNESIUM SULPHATE**—

treau, 58 pkgs.; Tunis, 10 cs.

SODA ASH—
Montreal, 600 bgs.; Quebec,
35 cks. Rotterdam, 195 bgs.

SODA CRYSTALS—
Beyrout, 20 pkgs.

SODIUM SILICATE—
Tunis, 32 cks.

SODIUM SULPHIDE—
Antwerp, 22 drms.

SULPHUR (FLOWERS)—
Rouen, 133 bgs.

TARTARIC ACID—
Montreal, 4 cks.

ULTRAMARINE—
Montreal, 1 br.

ZINC CHLORIDE—
Antwerp, 7 cks.; Bombay, 4 cks.

MIDDLESBROUGH.

Week ending November 22.

AMMONIUM SULPHATE—
Yokohama, 1,940 t., £41,818.

CAUSTIC SODA—
Madras, 50 t., £875.

CHEMICALS (otherwise undescribed)
Calcutta, 36 t., £523.

COAL PRODUCTS—
Benzole
Rotterdam 50 t., £1,250.

Naphthalene
Hong Kong, 1 t., £38.

HYPO & SODIUM SULPHITE—
Bombay, 10 c., £14

PITCH—
Antwerp, 2,926 t., £8,201.; Rot-
terdam, 1,637 t., £5,321

SALT—
Norresundby, 470 t., £1,382.

SODIUM SILICATE—
Hong Kong, 9 t. 19 c., £115.

SODIUM SULPHATE—
Gothenburg, 283 t., £920.

NEWCASTLE-ON-TYNE

Week ending November 22.

GLUE—
1 t.

RED LEAD—
Bergen, 1 t. 3 c.

SOAP—
1 t. 1 c. 3 qrs.

SODA COMPOUNDS—
15 t.

N. & S. SHIELDS.

Week ending November 22.

NIL.

SWANSEA.

Week ending November 22.

COPPER SULPHATE—
Bordeaux, 341 t., £27,350.

PRICES CURRENT.

THURSDAY, Nov. 27, 1919.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified
The prices in different localities may vary.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

DEPARTMENT OF OVERSEAS TRADE.

FEW Government departments, probably, have met with greater criticism at the hands of the business community than the Department of Overseas Trade, unless it be some of our war-time departments. The Department of Overseas Trade, however, is a permanent department, designed primarily as the result of the greater knowledge obtained during the war of Germany's commercial methods—although they were only too well known to most business men long before—to assist British trade overseas, as its name implies. The Government put it forward as meeting the demand for a Ministry of Commerce, and why such a separate Ministry was not set up nobody outside Government circles knows to this day. Difficulties seemed to beset the new department from the start, principally because it was held in certain quarters that the Consular Service, which clearly forms part of our overseas trade organisation, should come under the control of the new department, whilst in other directions it was contended that the Foreign Office should retain control of the Consular Service. The arrangement made by the Government was that the Consular Service should come under the control of the Foreign Office, but that there should be a joint Parliamentary Secretary, who would represent both the Board of Trade and the Foreign Office in the House of Commons. The first gentleman appointed to this post, Sir Arthur Steel-Maitland, soon got tired of the job and resigned, and he has been succeeded by Sir Hamar Greenwood. It is a characteristic of all Englishmen that after the fight is over they are willing to shake hands and make the best of the position as it then stands, and we are inclined to think that that is the attitude which the British business community ought to take in this matter. We have had the oppor-

tunity recently of listening to several speeches by the President of the Board of Trade himself and Sir Hamar Greenwood, and there can be no illusion on the ground that these gentlemen are doing all that is humanly possible to assist British trade abroad. The point is whether British traders and others are making full use of the facilities which the Department offers here. We recollect, also, that when Sir Albert Stanley was President of the Board of Trade he also begged our business men to make every demand upon the resources of the Department of Overseas Trade, but judging from what Sir Hamar Greenwood said only a few days ago to the leading members of another important industry, this is not being done. At the recent dinner of the Chemical Industry Club Mr. Ferguson urged the chemical industry to make use of the admirable foreign trade intelligence organisation of the Federation of British Industries, and we wonder whether the bulk of British industries are now so organised within the Federation that the services of the Department of Overseas Trade are really becoming superfluous. We hardly think that that can be the case, and yet there is the point in favour of the Federation that whereas the information which it collects is sent to the various members, in the case of the Department of Overseas Trade anyone desiring information has to ask for it. Frankly, we do not consider that an objection, but it does become a question whether the Department and the various foreign trade intelligence systems which are being set up by such bodies as the Federation of British Industries, and even by some of the individual trade societies, are not clashing to such an extent that full value is not being obtained from any of them, and that definite and close co-operation is necessary. Sir Hamar Greenwood has strong views on the aims and achievements of the Department of Overseas Trade, and is not afraid to express them. He puts it bluntly to British trade that his Department has only one aim—that of serving the interests of trade abroad; it is, he says, the taxpayers' money which is being spent in running it, and if it is not giving a commensurate return then it ought to be shut down. That is plain language for any Minister, be he, as Sir Hamar Greenwood says he is, a minor Minister, or be he a Minister with full Cabinet rank, and it seems to be due from the business men of the country definitely either to work loyally with the Department or to ask that it should be shut down. There is no half-way course for destructive criticism, and to that extent Sir Hamar Greenwood has placed the onus on the business community. It is the fact that the Department has collected an enormous mass of material bearing on foreign trade which is being utilised to but quite a small extent. Perhaps the secret of that, at the moment, is to be found in the charge recently made by Sir Auckland Geddes that too many manufacturers are ignoring the foreign market because of the fine bait offered by the home market. Production is admittedly far below what is demanded and prices are correspondingly high, for notwithstanding the general withdrawal of restrictions upon imports, apart from the specified key industries, the conditions in other countries are no better

than they are here, and really serious foreign competition cannot be looked to yet, except perhaps in one or two special directions.

SOCIETY OF GLASS TECHNOLOGY.

THE November meeting of the Society of Glass Technology was held in the University, Sheffield, Dr. M. W. Travers, F.R.S., presiding. The first paper was entitled

"THE REVERSIBLE EXPANSION OF REFRACTORY MATERIALS,"

by Mr. H. J. Hodsmann, M.Sc., and Professor J. W. Cobb, O.B.E., and was read by Professor Cobb.

Silica refractories, said the authors, on firing have a permanent expansion, whilst fireclay refractories have a permanent contraction. On subsequent heat treatment both types of refractories undergo expansion which is reversible on cooling. The paper dealt with this reversible expansion. The authors briefly expounded methods of measuring expansion at high temperatures, and described in full the methods actually employed in the particular work under discussion. The range of temperature through which reversible expansion had been investigated was 15° to 1,000° C., and some very remarkable results had been obtained. It was shown that alumina and kaolin expanded regularly within the above temperature range. Silica, whilst having approximately the same mean expansion between 15° and 1,000° C., behaved very differently at intermediate temperatures. Thus between 15° and 500° C. it expanded regularly at a rate slightly greater than that for kaolin. Between 500° and 600° C. its mean coefficient of expansion was greatly enhanced, whilst between 600° and 1,000° C. its expansion was practically nil. The anomalous behaviour between 500° and 600° C. was probably due to a change α quartz to β quartz. There was nothing in the results to indicate the formation of tridymite between 600° C. and 1,000° C.

Curves were shown indicating the behaviour of various materials between 15° and 1,000° C. A mixture of 80 per cent. ganister and clay behaved like silica. Fireclay and potclay behaved similarly to silica, the behaviour being nearer that of silica than that of kaolin, and it was of the nature of the silica curve. Ball clay, alundum and carborundum, behaved similarly to kaolin. In conclusion the authors discussed the bearing of the results upon the arching and subsequent heating of glasshouse pots and other refractories.

A second paper was read, entitled

"A PROPOSED STANDARD FORMULA FOR A GLASS FOR LAMP WORKERS,"

by Mr. F. W. Branson, F.I.C., and Mr. F. H. Branson, A.I.C.

The authors reviewed their early work of investigation on pre-war tubing for lamp-workers, and gave an analysis of the tubing they considered most suitable for lamp-workers, together with a batch which on melting would give this glass. Tubing had been made from this batch, which was satisfactory in every way. It could be reborn many times without devitrification, and was especially suitable for making plugs, stopcocks, and bulbs. It joined easily with all the best British-made glasses, including the resistant varieties, and was quite suitable for the repair of pre-war imported chemical glassware. The glass was quite free from appreciable colour, and did not darken in the blowpipe flame.

SOME DEVELOPMENTS IN CHEMICAL ENGINEERING.*

By A. E. MARSHALL.

THE war-time demand for the products of the chemical industry has of necessity resulted in improvements in chemical engineering practice during the last three years. The inability of the factories in existence at the outbreak of the war to cope with war requirements was responsible for the erection, in the United States and in England, of plants designed to produce large tonnage outputs of specific finished materials. As the desired capacity was known in advance, and as the product was definite, the designers of these plants had opportunities in arrangement of units which are lacking to a certain extent in the design of factories which have an indefinite future capacity and which necessarily will have to be extended at a later date to take care of new products and by-products.

An inspection of a number of the war-time American factories, and six weeks spent in the English factories during the early summer of this year, have resulted in the conclusion that full advantage was not taken of routine operations and of labour-saving devices, which in other industries had reached advanced stages of development. The imperative need for production and the necessity for adapting equipment available during the building of the plants have to be taken into account, and a full knowledge of the difficulties in securing prompt supplies of adequate machinery would doubtless modify in some measure conclusions based only on a study of the completed plants.

WIDER STUDY OF ENGINEERING PROBLEMS.

Even with such allowance, a survey of the latest development of chemical engineering leaves a sufficient reason for the suggestion that the chemical engineer should broaden his lines of study from the limited one of the purely chemical field to the wider viewpoint of engineering work and operation in other industries which present problems analogous to the manufacture of chemicals. The chemical engineer, or the chemical plant executive, is prone to believe that his manufacturing problems are peculiar not only to the chemical industry, but even to his specific branch of the industry, whereas other industries have had similar problems and have reached solutions of these problems which are capable of adaptation to the needs of the chemical factory.

In the past the average chemical plant has started out as a producer of one or of several standard chemical products, and with the development of the business, new but usually inter-related products have been added to the factory output. Invariably the original design was a complete unit so that even an increase in the output of the original products necessitated the addition of separate complete units without the possibility of effecting economies through the use of labour-saving devices applicable only to tonnage movements. When extensions through the multiplication of products became necessary the situation was much worse, as the new additions had to be located externally to the original plant unit, and the conveyance of materials produced in the original plant to the new units in which they were to be utilised

was necessarily reduced to primitive forms of transportation. There are few industries to-day other than chemical manufacture which present the anachronism of linking up the travel of the semi-finished product of one operation to its final point of utilisation by manual means.

A generalisation of this nature must of course be qualified by exceptions in the case of plants designed to produce large tonnages of the low-priced chemical staples, or, as they are more generally termed, "heavy chemicals." Such factories invariably have labour-saving tonnage-movement devices, although they are not always in the forward state of development of the means used in other industries.

HANDLING MATERIALS.

This difference in chemical factories is clearly evident in comparing the facilities for moving raw and finished materials in, say, a modern large-tonnage ammonia-soda plant, and a plant producing six or eight products by stages. The soda plant will move its materials progressively with mechanisms which require the smallest amount of human labour, whereas the average several-product factory makes each separate movement discontinuous instead of following the easily possible lines of regulated progression. Between the various inter-related units of a several-product chemical factory there is frequently a bottle-neck of transportation of materials.

A study of what has been accomplished in the automobile industry in the way of linking up producing departments so that a constant output of finished automobiles is obtained, should open up to the chemical engineer a new vista of possibilities. The South furnishes through its fertiliser industry excellent examples of discontinuous work. A fertiliser plant can be as well ordered in its progressive stages of manufacture as an automobile plant, but the majority of the fertiliser factories move their entire output at least once, and sometimes twice, during the stages of manufacture, by hand labour in buggies. Labour in the South was once cheap, and the incentive to the use of labour-saving devices and the proper layout and routine of departments was lacking. These conditions have changed with apparently no chance of return, and so the fertiliser manufacturer, and the chemical engineer specialising in fertiliser plant design, will be forced to build new plants in which economies in labour are possible.

This brings up the point of the original design of chemical plants and the necessity for designing with an eye to the future. Some chemical plants built within the last five years will find it difficult to make extensions which permit of a lowered cost of production or even a cost equal to the original plant, for reasons such as lack of strength in the building structure preventing the employment of mono-rail cranes or similar mechanisms to convey supplies of raw materials moving from the original storage bins or piles to the new extensions. Time can more profitably be spent in designing the present to suit the future than in trying to

* Paper read before the American Institute of Chemical Engineers.

add in the future to a completed unit which has no outlets for expansion.

ADAPTATION OF IMPROVEMENTS IN OTHER INDUSTRIES.

The statement made in the early part of this paper that other industries can furnish useful ideas to the designer and the operator of chemical plants is intended as a suggestion. To cover in detail the comparisons which present themselves would require several papers, so that an attempt will be made simply to draw attention to some developments in other industries which are just finding their way into the chemical field or which are still awaiting proper recognition. As a preliminary, there are some useful guide-posts on the road along which the industry has passed.

Take the "Chemical Catalogue," which is issued under the auspices of this Institute, and compare the mechanical and labour-saving devices shown in the first volume (1916) with the much greater variety in the present (1919) volume. The manufacturers are not listing plant equipment in 1919 that was not in existence in 1916, but rather they are listing equipment which in 1916 was used only in other industries. Compare also the advertising pages of the chemical journals from, say, 1912 to the present time, and note the introduction into chemical advertising of filters which had found extensive use in the metallurgical field, of grinding machinery primarily developed for metallurgical plants and cement mills, belt conveyors, mono-rail cranes, grab buckets, and other mechanical devices for handling materials which were introduced into chemical manufacturing processes after they had become standard parts for other industries. And to-day other industries have in use types of equipment which would solve many of the problems we consider solely as chemical engineering problems.

First, there is the matter of moving materials through the cycle of the plant operation. The movement, at the lowest possible cost, of large tonnages of raw and finished materials has assumed great importance in industries where there is close price competition. The progress of chemical manufacture with the consequent increase in size of chemical plants will make this feature of plant design of vital interest to the owners of these plants. Water-front factories bringing in their raw material by steamer will be forced to adopt unloading methods equivalent to those used in the iron and steel industry. Factories in the interior will have to be arranged so that railroad cars can be placed directly at the discharging or loading points so that double handling of material is avoided. The linkage of materials, moving from one part of the plant to another, and referred to in the earlier part of this paper, will have to be changed from manual to mechanical means, and the plant units so arranged that the intervals to be bridged in the movement occupy the shortest possible distance while still permitting the future growth of the units.

All of these improvements in handling have become part of the routine design of other industries, and the chemical engineer, by extending his observation outside of the chemical field, can usually find an operation with characteristics similar to the project he is interested in, which has developed handling facilities adaptable to the needs of the chemical plant.

POWER PLANT.

In the case of the chemical engineer concerned in the layout of a furnacing operation, a study of a modern

central station power plant will often suggest improvements over existing chemical practice. There are many chemical plants which use as much coal under furnaces each day as a larger power plant does under its boilers. The power plant is in the business of utilising coal for profit, so it has, in the movement of coal, displaced manual labour by mechanical methods. The power plant unloads its coal into storage with grab buckets operated from gantry or overhead cranes, and has developed other forms of mechanical equipment to convey the coal from storage to the boiler-room and to the individual mechanical stokers. The ash from the boilers is gathered by either drag conveyors or pressure or suction devices, and is delivered to hoppers, which discharge direct into cars or ash scows.

The arrangement of the average chemical plant carrying on furnacing operations effectually prevents the use of a complete scheme of mechanically handling coal and ashes, as the furnaces have grown topsy-like in various parts of the factory, and even the coal storage itself has usually to be placed remote from the furnaces.

The control of combustion, which is essentially a chemical problem, has progressed to a greater extent in power plants than in chemical factories, and it is the unusual chemical factory which has a complete equipment of CO₂ recorders, pyrometers, and draft-gauges on its furnaces.

Further suggestions along these same lines are afforded by the study of flow sheets of metallurgical works. The flow sheet of a modern smelter, with its allied leaching and flotation plants, represents a development in low-cost movement far ahead of the average large chemical plant, although the equipment used in the smelter is in many instances equally serviceable in chemical factories. Leaching by counter-current decantation in its present efficient state is a development due to metallurgical engineers who were faced with the problem of economically treating low-grade ores. The same apparatus will serve the chemical manufacturer for the production of solutions or an insoluble precipitate through the inter-action of a solid and a solvent or solution. The various types of classifier have made closed-circuit grinding a possibility, and the chemical manufacturer can adopt from the metallurgist without change a method of operation which gives a continuous finely-ground product without a distinct intermediate separation.

Brief mention has already been made of filters used in metallurgical work and of their adoption in chemical processes. The continuous removal of a solid product from a waste liquid or the continuous separation of a solution from a waste solid in suspension means a great reduction in cost as compared with the use of intermittent plate and frame presses.

TREATMENT OF GASES.

The various processes of illuminating-gas manufacture afford useful study, and some interesting developments should result from the adoption by the chemical industry of gas washers of the Feld type. Feld-type washers have provided the gas engineer with a compact mechanism which gives an intimate contact between the gas and an absorbing or scrubbing liquid, while the arrangement of the washer permits the liquid to reach a high concentration in solid particles without danger of stoppage. A cast-iron washer of this type would, as an example, remove chlorine, using caustic soda solution as the liquid, from the exit of a chlorination

operation, and going for the moment outside the strictly chemical field, it might serve in an absorption method of recovering gasoline from natural gas, in place of the present expensive compressor plants.

Made of acid-proof materials, and somewhat modified in arrangement, this same type of washer might be used to replace one of the unsatisfactory details in a sulphuric acid chamber plant—the Gay-Lussac tower.

As an illustration of the satisfactory use of mechanisms developed in other industries, an instance at the factory with which the writer is connected may be cited. One portion of the plant operation depends on the continuous supply of large tonnages of raw material. Prior to 1918 this raw material had always been delivered at the plant in steamers—and a complete scheme of mechanical unloading had been installed and had given excellent results. The shipping strike and the shortage of steamers in 1918 made it necessary to change over from steamer to box-car conveyance, and as the raw material was used at the rate of 600 tons a day it meant either excessive hand labour in unloading the cars or the adoption of some mechanical unloading device.

A review of practice in the chemical industry did not afford any suggestions, neither did the usual engineering catalogues or trade publications refer to a machine which would solve the problem. Consideration of materials that were moved in tonnages in box-cars led to an investigation of the grain industry, and it was found that the grain elevators had been using a mechanical box-car unloading device for at least 10 years, and that this device could be adapted without change to the conditions we had to meet.

The grain unloaders were installed, and as a result of their use the movement of incoming raw material kept pace with the consumption. The congestion of plant facilities through the inevitable delays which would have occurred under hand-unloading conditions were avoided, and most important of all, the cost of putting the material into the plant was kept down to a reasonable figure.

In bringing this paper to an end, the examples which have been selected do not exhaust the possibilities of comparison, but they will serve the writer's purpose if they are accepted as evidence in support of the conclusions which were advanced in the first paragraphs—that the chemical engineer can study to his advantage engineering progress in other lines of industry.

ELECTRO-PLATING WITH ARSENIC SOLUTIONS.

IN a paper read by Mr. O. P. Watts before the American Electro-Chemical Society it is recorded that it has been discovered recently that by immersing iron for a few moments in an acidified solution of arsenious oxide, an adherent copper-plate may be deposited from an acid electrolyte, but no adequate explanation had been offered for this unique effect of arsenic. It is shown that certain solutions of lead and antimony may be substituted for the arsenic dip, previous to direct-current plating of copper on iron from copper sulphate. It appears to be impossible to obtain a perfect plate on iron from solutions of bismuth chloride by the usual methods of electro-plating; but use of the arsenic or antimony dip is attended with the same success as in copper plating. The successful substitution of solutions of antimony and lead for arsenic, and the application of

these dips to plating on iron with bismuth, show that the beneficial effect of the arsenic dip is not due to a property peculiar to arsenic alone, but is the result of coating the iron with a metal whose potential in acid solutions is so near to that of copper that it is possible to deposit a good copper plate upon it, yet whose potential is not so far below iron that it will deposit on iron in a powdery, non-adherent form.

ETHYL CHLORIDE.

AT a meeting of the London Section of the Society of Chemical Industry on Monday, Mr. Julian Baker presiding, Mr. Albert Henning read a paper on "Ethyl Chloride."

The author said the object of the paper was to dispel the false ideas which existed in certain quarters on the part of both engineers and chemists as to ethyl chloride, which was too often regarded as a troublesome material with cheapness as its only advantage. These ideas, however, were quite inaccurate. Ethyl chloride was prepared originally almost entirely for medicinal purposes, and the extent of its manufacture before the war was seen in the fact that one German factory alone turned out 250,000 kilos per annum, and another 80,000 kilos. That, however, was obviously not intended for anæsthetic purposes, but was chiefly required for ethylation in dyestuffs and also for refrigeration and as a solvent. Ethyl chloride was now being produced in France, Switzerland, and Canada, and a factory had been started in Australia. Compared with other ethylating agents, ethyl chloride was the cheapest by about 60 per cent.

CONTAINERS.

There was an erroneous impression that ethyl chloride had to be stored in high pressure cylinders, but far from that being the case, it was supplied in syphons, and could be poured out of a jug without the slightest danger. As an instance of the type of container in which it could be placed, he showed a slide of a milk-churn container, a number of which had been seized on a German vessel in the early days of the war whilst on its way to the Argentine with a large quantity of material for a hospital out there. It could also be stored in ordinary bottles, and several Winchester bottles with ordinary corks had been used. Elaborate high-pressure apparatus was not necessary, and he was glad to say that the railway regulations for the transport of ethyl chloride had been amended.

As demonstrating the slow rate of evaporation, he filled two tumblers with ethyl chloride and allowed them to remain on the lecture table during the meeting, and mentioned that the evaporation of a sample which had been left on a mantle-piece over a gas fire for six hours showed an evaporation which dropped from 0.15 in the first ten minutes to 0.07 per cent. at the end of the six hours. It was only inflammable over a comparatively narrow range and had withstood attempts to obtain an explosion. A cigarette dropped in a beaker of ethyl chloride would be extinguished.

USE AS REFRIGERANT.

Describing the use of ethyl chloride as a refrigerant, the author said that in America the Board of Fire Underwriters had approved its use, and it was being used in the United States Navy. The principle uses of ethyl chloride were stated as follows: (1) In the

synthesis of dyestuffs and drugs as an ethylating agent; (2) as a working substance in refrigerating machinery; (3) as a solvent for extraction purposes; (4) in research work and laboratory practice.

A large number of slides were shown illustrating types of apparatus now in use; and emphasis was laid on the point that it does not become acid on storage if properly stabilised during manufacture. There was, said the author, too little recognition of the importance of ethyl chloride and too much tendency to refer to the more expensive methyl derivatives, an enormous quantity of which were made in Germany before the war, although he doubted if these methyl derivatives were always methyl, though so labelled. It was highly probable that they were sometimes ethyl.

He claimed that the paper gave, for the first time, a complete set of figures with regard to the use of ethyl chloride in the design of refrigerating machinery, relating to the thermal properties, vapour pressure, latent heat, specific volumes, etc. Instead of an elaborate compressor plant a simple rotary pump could be used. For a simple ethyl chloride machine with cooling water at 65° F., an 18in. diameter rotary pump running at 150 to 300 r.p.m. could be employed. In this country ethyl chloride was practically unknown as a refrigerant, but in America it had been known and used for several years, and 150 plants were running there. The Canadian Government had 20 plants, and the French Government had six or seven warships fitted. The oldest ethyl-chloride machine for refrigeration purposes had been in use for nine years at the Hanover Bank, New York, and it had been removed in order that a larger one might be fitted. A very promising development in this connection was in the direction of small plants for household use, having a capacity of 500kg.-calories per hour, which could be driven by a $\frac{1}{4}$ H.P. electric motor. Ammonia or CO₂ plants would be positively dangerous in private houses owing to the high pressure necessary, whereas with ethyl chloride the highest pressure was 15lb. per square inch.

One reason for the bias against its use in laboratories was the fact that it had not been supplied hitherto in convenient packages, but that difficulty had been got over. As a solvent in the laboratory it had many advantages, whilst its low boiling-point rendered it extremely useful as a cooling agent for small laboratory use in the absence of ice.

The paper, as prepared by the author, was an extremely lengthy one and contained some 30 lantern slides, but it was delivered in far too hurried a manner. It was, no doubt, this fact which resulted in the discussion being so poor.

DISCUSSION.

The Chairman asked the author how the refrigerating process employing ethyl chloride compared as regards cost with the ammonia machine.

Captain Nash asked whether, in extracting fats from seeds and nuts, chloride extracted the pure oil, or were other matters extracted with the oil? Was the process more in the nature of ether or petroleum ether in regard to the extraction of matter other than fat?

The author said there were other by-products as well, but they could be got rid of. He could not compare it with petroleum ether, because he had made no comparative tests.

Mr. Tallantyne said that in using ethyl chloride as an ethylating agent he believed it was usually dissolved in alcohol at 150° C., but he had found that at about 140° quite a considerable amount of acidity was developed in the ethyl chloride in alcohol, which attacked iron slightly.

Mr. Gardner said he used a certain amount of ether for promoting rapid crystallisation by pouring it into the satu-

rated solution, and after the crystals had separated out he boiled the solution in ether. Could he use ethyl alcohol in the same way?

Mr. Garrard, speaking with regard to the ethylation of amines, asked whether it was possible to introduce any number of groups into the diamine, or was there a limit to the number?

The Chairman, in asking the author to reply, said that he took it that what Captain Nash meant was that if they were extracting such a substance as cocoa butter by ethyl chloride, it would also probably remove the cocoa red as well.

Mr. Henning, replying to the discussion, said the chairman was right in his last remark. He had there some otto of roses, and there was a large quantity of the pure colour of the red rose. With regard to the comparative cost of the ethyl chloride refrigeration process and the ammonia process, he would ask Mr. Bishop, who had gone into this question very largely, to deal with that matter. There were not sufficient ethyl chloride machines at work to give a very precise comparison. There were probably 200 or 300 machines, but they did not enable a very exhaustive statement to be made as to comparative cost, because the comparative data was not available. In answer to Mr. Garrard, there had not yet been very much time, and he had only been able to deal with a few. He had samples there of phenetol, diethylaniline, benzylethylaniline, and monoethylaniline; and although he had tried others, he thought they must be content with these for the present. A great many experiments had been made, however, and he would be pleased to answer any further questions in writing if the members were interested, and, indeed, to make experiments for them. With regard to the use of ethyl chloride instead of ether in connection with crystallisation, that could be done.

Mr. Bishop, speaking on the question of the comparative cost of ethyl chloride plants for refrigeration with other systems, said he had built a number of plants, and from his experience he should say that the ethyl chloride plants were from 5 to 7½ per cent. more expensive than the carbonic anhydride system. These plants, however, were only small ones, and they probably, owing to their range of size, cost more than ammonia, carbonic acid, or SO₂ systems, but there were the advantages of simplicity, speed, and automatic operation. The difference of from 5 to 7½ per cent. was in the capital cost; the cost of running was practically the same.

A hearty vote of thanks was accorded the author.

ALUMINIUM ALLOYS.

THE United States Bureau of Standards has recently issued two papers on aluminium alloys. In Technologic Paper No. 132, P. D. Mercia, R. G. Waltenberg, and A. N. Finn deal with the properties of ternary alloys of aluminium and magnesium with copper, manganese, or nickel. The alloys were rolled out in sheet and tested as cold-rolled, after annealing, and also after quenching at 500° C. and aging at ordinary temperature. In the tensile tests the copper alloys came out decidedly best, and they were further improved by heat treatment, which improved the nickel alloys only a little and the manganese alloys not at all. For the corrosion tests the alloys were sprayed with salt water for two months. In these tests the Al-Mg alloys behaved better than aluminium itself and than other Al alloys, and the ternary manganese alloy proved least corrodible, the copper alloy coming next in order. Annealed commercial aluminium was more resistant to corrosion than the hard-rolled metal, but it did not compare favourably with most of the alloys. The "Heat Treatment of Duralumin" is the subject of Scientific Paper No. 347, by Mercia, Waltenberg, and H. Scott. The temperature of quenching should not exceed the eutectic point of CuAl₂, about 520° C., but should be kept near that temperature and be followed by quenching in boiling water and, for hardening the metal, by aging at 100° for five days.

EXPLOSIBILITY AND INFLAMMABILITY OF DYES.*

By B. HUMISTON, W. S. CALCOTT, AND E. C. LATHROP.

THE following work was taken up with the view of eliminating, or at least reducing, the danger of fire and explosion in the finishing of dyes and intermediates. Although the Du Pont Company has not experienced any serious difficulty occasioned by fire or explosion, we have been informed that a number of accidents have occurred throughout the country, and because of the risks involved considerable work was carried out along this line. Aside from eliminating the loss of life, there are also the possibilities, of course, of eliminating the loss of material and increasing the capacity of the various units used in finishing operations. Very little data of any sort were available from which it could be predicted under what conditions dyes or intermediates were likely to explode or decompose, other than a certain amount of plant experience. The problem was, therefore, attacked from the laboratory point of view, with the idea of developing methods by which the element of risk in each step of the finishing operation could be accurately determined.

The dyes or intermediates, as delivered to the finishing department, consist of a wet mass, usually a press cake, with a widely varying amount of moisture. To prepare it for the market it is necessary that it be dried, ground to a fineness depending upon the individual material, and standardised—that is, brought to the correct shade and strength. These three operations combined are referred to as the finishing of the material. For the sake of clearness, each of these three operations will be taken up separately.

DRYING.

In drying, little danger is encountered from moistures of dust and air, as very few of the dryers used for dyes or intermediates cause the formation of any appreciable amount of dust, except *in vacuo*. Any trouble encountered in this operation is therefore likely to be due to the effect of the temperature upon the mass of the material. This effect may manifest itself as an oxidation, which may cause the material to become heated, or it may consist of a decomposition which may be accompanied by the evolution of gases. This latter may also be sufficiently rapid to become explosive. A good illustration of the oxidising type of dye is sulphur black. This in the moist form oxidises so readily that it is almost sure to fire if dried in the presence of air. In fact, it will frequently oxidise sufficiently to materially injure the shade on simply storing in paste form, if the amount of water present is insufficient to form a slime. If, however, it is dried and cooled in the absence of air, it becomes quite stable and may be kept indefinitely without any change in shade. Victorian green, on the other hand, is a good illustration of the type of material which decomposes without taking fire if overheated at temperatures above 100° C. In the case of Victoria green, an exothermic reaction sets in, the dyestuff being reduced to the leuco base by the oxalic acid present, and carbon dioxide mixed with some carbon monoxide is given off freely. As the reaction is strongly exothermic, it could quite easily become explosive in a confined system.

This investigation did not include slight oxidation of the materials concerned, but only cases in which the oxidation was sufficiently rapid to cause the materials to

take fire. The apparatus used for determining both these points and the liability to decomposition without oxidation consisted essentially of a large test tube enclosed in an air bath and capable of being heated to a temperature of 500° C. A small amount of the dye or intermediate is placed in the test tube, a thermocouple immersed in the dye, a slow current of air passed, and the temperature gradually raised. The point at which the dyestuff takes fire is determined, although, as a rule, smoke or fumes can be noted before ignition takes place. The results can be checked with a fair degree of accuracy.

For determining the danger of decomposition of the dye, with or without the evolution of gases, a similar apparatus is used, excepting that no air is passed through and a delivery tube is connected to the test tube, so that any gases given off are conducted to a gas burette. The temperature of the test tube is raised until decomposition begins, and it is then noted whether the reaction is endothermic or exothermic, as indicated by the development of higher temperatures in the dye than in the air bath with which it is heated. The point of initial decomposition can be quite readily determined, provided gases are given off under decomposition or if the decomposition is exothermic. Dyes which decompose exothermically are, of course, much more dangerous to handle than those which decompose endothermically, as the dyes, being in the dry state, are very poor conductors of heat, and being surrounded by the heated vessel, the conditions are very favourable to the development of high temperatures, which result in fires or explosions. Of course, after the point at which decomposition or rapid oxidation sets in has once been determined, it is a simple matter to eliminate this element of risk in the plant by working at a sufficiently low temperature. This should, in general, be not less than 25° to 30° C. below the temperature of exothermic decomposition or ignition, allowing for variations in the quality of the various batches of dyes and for faulty temperature control.

GRINDING.

In grinding, in addition to the effect of temperature on the mass of the material, there must also be considered the effect of temperature upon the mixture of dust and air which is invariably present in grinding and drying solids, and also the probability of the occurrence of sparks in the mill. A certain amount of heat must be developed in any grinding operation, and the work done in reducing the size of the particles must reappear in the form of heat, unless provisions are made for removing this heat as fast as liberated, which is not usually the case. There will be a rise of temperature in the grinder, the extent of the rise depending, of course, on the material being ground and on the mill being used for the purpose, so that it is difficult to fix any limits on the temperatures to be expected in grinding operations. It may be stated safely, however, that temperatures up to 75° C. may be experienced in the ball mill type of grinder, and temperatures well over 100° in the impact crusher type. In the ball mill the possibility of sparks can be largely reduced, as suitable choice of the material of the mill itself and of the balls, copper mills with copper balls being almost free from risk of this sort. In the impact crusher type of mill, however, for example, where the dye is disintegrated by being submitted to blows from a revolving beater arm, the accidental intrusion of foreign particles can easily cause sparking through being struck by the rapidly revolving beater. Sparks due to static electricity must also be considered in grinding.

* Paper read before the Dye Section of the American Chemical Society, and published in the *Jour. of Ind. and Eng. Chem.*

The method for determining the effect of heat on the mass of dye in grinding is, of course, identical with that used for the corresponding factor in drying. It is obviously necessary, however, in grinding to determine the effect of the additional factors introduced, the effect of temperature on the mixture of dust and air. In order to determine the stability of the dust and air mixture, there is employed the apparatus developed by the Bureau of Mines for the determination of the explosibility of coal dust and air mixtures. This consists essentially of a 1,000cc. bulb containing a small, hollow cylinder of platinum, heated from the interior by means of a platinum coil, the temperature of the platinum cylinder being accurately determined by means of a thermocouple. The dye under investigation is placed in a funnel at the bottom of the bulb and the dust cloud is carried by blowing air upward through the funnel. This delivers the dust cloud around the heated platinum cylinder. The explosion point is taken as the temperature at which a noticeable development of pressure takes place, which is registered on a gauge connected with the apparatus. At this temperature a visible flame is seen to develop and spread through the bulb. By a slight modification of this apparatus, the dust cloud is subjected to the effect of sparks from an induction coil or from a small emery wheel. Little work has been done on this latter method of testing, however, but from the former—that is, the use of the platinum cylinder—results ranging from 400° to 1,100° C. have been obtained as the explosion points of dusts with varying amounts of air, and it is possible to check these results within about 50°. The results obtained are in fair agreement with plant experience, as regards the relative safety of the different dyes so far investigated. This apparatus, however, has the weak point that the dust-air mixture used is not necessarily that most sensitive or most likely to explode.

Somewhat more reliable results are therefore given by a modification of the apparatus for determining the decomposition temperature. This apparatus consists essentially of a large test tube immersed in an air bath with a tube for admitting air to the bottom of the test tube. The test tube is gradually heated up, while passing through it is a current of air sufficiently rapid to keep the tube completely filled with dust. The temperature of spontaneous ignition is determined by inspection. Usually the decomposition is very noticeable, being detected by change in colour and development of fumes. The increased sensitivity of this apparatus over the Bureau of Mines type is shown by the fact that the temperatures at which explosions occur in the Bureau of Mines apparatus range from 400° to 1,100° C., while the temperature range for the same series of dyes in this apparatus is from 250° to 550° C. The data obtained from the two forms of apparatus, however, give a very clear idea of the relative stability or instability of the dye, as the Bureau of Mines apparatus gives the relative ease with which the different dyestuffs will propagate an explosion, once started, whereas the so-called spontaneous ignition temperature gives fairly definitely the order of stability of the different dyes or intermediates when heated in the presence of air. Little difficulty has been experienced in obtaining concordant results with this apparatus, checking within 10° to 15°.

STANDARDISING.

In the standardisation of dyes explosion risks are very much the same as in grinding, although, of course, to a much lesser extent, as the temperatures encountered are

much lower and the risks of striking sparks in the mixture are, of course, much less than the risks of striking sparks in the grinding, whether of the ball mill or impact type. An additional factor is introduced, however, in that standardising reagents are usually added to bring the mixture to the proper strength. Stability of these reagents and the possibility of a reaction between the reagents used and the dye or intermediate has to be considered; for instance, the accidental addition of soda ash to Victoria green would probably result in a vigorous reaction between the oxalic acid of the Victoria green and the soda ash, with the possibility of raising the temperature to the decomposition point of Victoria green.

This investigation is still in the preliminary stages and the methods used are tentative. They are being used, however, pending the development of more satisfactory methods for covering these points, or other points which may be brought up. They are believed to be of considerable value, however, as each method has been developed to answer some definite problem known to have occurred, and only after having given a satisfactory answer to an original problem have they been applied to the solution of similar problems for other materials. One difficulty which has been encountered is the lack of satisfactory standards with which to compare the laboratory results. Certain materials—as, for example, alizarine yellow—are known to be unsafe, while certain others are believed to be safe, and in default of more satisfactory data these materials have been temporarily taken as standards in carrying out this work. It is realised, of course, that the mere fact that the material has been safe to date does not prove that it will remain safe indefinitely, and that some of the dyes now passed as perfectly safe may eventually be discovered to be dangerous. However, it is believed that by continuing this investigation along these lines, it will be possible to establish fairly definite limits as regards temperature and the proper type of mill for grinding each material, and in cases where the element of risk warrants it, to state which of these materials should be segregated or handled in small lots, or in extreme cases handled in the paste condition. An incidental advantage which has already been gained to some extent has been the selection of the proper temperatures in drying, so as to give the maximum speed of drying with the minimum of danger, thereby increasing the capacity of the drying units. We hope later to communicate more fully on this subject.

SOUTH AUSTRALIAN PHOSPHATE DEPOSITS.

THE latest bulletin of the geological survey of South Australia deals with the phosphate deposits of South Australia, and is the work of the Assistant Government Geologist (Mr. R. Lockhart Jack). Mr. Jack says South Australia is fortunate in having supplies of phosphate rock scattered over a wide area, which, although not equal to the imported material, so far as having been yet discovered, can be made available to supply part of the demand. In a few isolated cases specimens or small pockets assaying over 80 per cent. tricalcic phosphate may be found, but first-grade rock is regarded as over 60 per cent., the best running from 65 to 70 per cent. Second-grade rock falls to 55 per cent., but some is used as low as 50 per cent., the definition of what constitutes usable rock varying with the purpose

for which it is intended, and the nature of the impurities. The lower grade material is used for direct application after fine grinding, and is exported both prior and subsequent to grinding for use in wetter regions. So far the bulk of this low-grade rock has been utilised in a raw state finely ground, and in some cases mixed with a proportion of superphosphate or other fertilisers. It has also been used to some extent in the State in conjunction with high-grade imported rock to make a blend that would produce superphosphate conforming to the percentage of soluble tricalcic phosphate of a brand registered under the Fertiliser Acts of 1900. The output of phosphate rock in South Australia to the end of 1918 was 89,456-tons, valued at £96,095.

INFLUENCE OF IMPURITIES IN LEAD WHEN HEATED WITH CONCENTRATED SULPHURIC ACID.

A PAPER on this subject was read by Mr. Charles E. Barr at a meeting of the London Section of the Society of Chemical Industry on Monday.

The paper contained the results of experiments which the author hopes will be of use to sulphuric acid manufacturers and other users of lead for chemical purposes. Two grades of lead were analysed, and they proved to be very different in their resistance to the solvent action of sulphuric acid. The tests showed that those samples of lead in which copper predominated as the impurity were most resistant when heated with sulphuric acid. Experiments were also carried out to see at what temperature sulphuric acid attacked various other metals, and several tables of figures are given in the complete paper. The general result shown by the experiments was that, the purer the lead, the less liable it is to attack. It had, however, been found desirable to add a small percentage of copper, 0.2 to 0.5, in order to ensure obtaining the maximum resistance.

Mr. H. M. Ridge asked the author whether he could give any reason for the fact that, according to his tables, lead containing a larger amount of bismuth generally suffered attack at higher temperatures than a lead which was comparatively free from bismuth. The same applied to the lead containing a considerable amount of silver. He had always looked on bismuth and silver as two elements which played an important part in the chemical attack of lead, and in obtaining his supplies he had always laid a certain amount of stress on reasonable freedom from bismuth and silver. Therefore, he would very much like to know whether the author could give any reason for the metal which happened to be lower in bismuth and silver being attacked at a lower temperature. He would also like to ask whether the author had done any work in connection with the varying atomic weights of lead, and whether he had found in his experience that that had any bearing on the question of chemical attack by sulphuric acid.

Mr. Rowell said it was usual to demand Pattersonised lead for best work in sulphuric acid plants, and the difference between that and the lead of which figures were given by the author was probably due to the zinc content. A small percentage of zinc would cause a much more rapid action of sulphuric acid on lead than any other metal. It did not appear that the silver content was deleterious, because Pattersonised lead usually contained more silver. The author's results were com-

parative to the case of concentrated sulphuric acid in a lead pan. Lead containing a large amount of copper in a sulphuric acid chamber where the acid was comparatively weak would not last so long as a chamber made of pure lead entirely. The purer the lead was, it was certain it would last longer, particularly in chamber work.

Mr. Lancaster pointed out that if more than 0.2 per cent. of copper was introduced into the lead it gave rise to commercial difficulties. He could not agree with Mr. Ridge's remarks with regard to the effect of silver, and he thought that if he were to refer to other authorities he would find that a small quantity of silver protected the lead. Another reason why Pattersonised lead was popular was because, *per se*, it invariably contained a very much larger percentage of copper than the lead produced by the Parke's process for the simple reason that, in trying to extract silver from lead bullion, zinc was added, which had an affinity for extracting copper more than any other metal, but it was entirely a mistake, as the author had said, to assume that because a lead was a Parke's lead it was a bad lead for chemical chambers, or, equally, to assume that because a lead had been made by the Patterson process it was a good lead or a suitable lead for chemical chambers. The science of the metal was now very much better understood than it had been in the past, and the manufacturers of sheet lead were producing lead to-day with only small traces of copper which would stand up to strong sulphuric acid, and there was no doubt in his mind that the purer the lead, the more it would resist the action of acid. There was little doubt, too, that copper acted as a dope against certain impurities. That was borne out very fully by some experiments which he had made recently in producing electrolytic lead, by which he meant pure lead and not a lead such as had been often spoken of in the past as electrolytic lead—one that would test 99.998 per cent.,—and that lead would stand up against sulphuric acid and without any addition of copper whatever.

The Author, replying to the discussion, said the analyses which he had given in the paper did not represent the whole of the work that had been done. He only gave the figures as typical analyses. Many others were done in which the analyses, with the exception of the copper, were very similar, but always with the same difference in the resisting power to the acid. With regard to the atomic weight of lead, he was afraid he had not done anything in that direction. With regard to Mr. Rowell's remarks concerning the Patterson *versus* the Parke's process, that had been so in the past, but lead in the Parke's process was now subject to a treatment which purified it and rendered it equal to Pattersonised lead, and from that point of view he thought that those who wanted Pattersonised lead were mistaken. Subsequent research had also shown that the Parke's process still further eliminated the zinc. He had not said anything in the paper with regard to copper in chamber lead for sulphuric acid because he had carried out practically no experiments with regard to weak or dilute sulphuric acid. In some cases it was necessary to have a lead which was harder for certain purposes—perhaps the lead had to be handled more drastically, and in that case it was not so much a question of temperature as the hardness of the lead. Then it was hardened with antimony, and, of course, the same temperatures did not apply; 0.2 per cent. of copper was not necessary if the lead was pure. The purer the lead, the smaller the amount of copper needed.

SWISS DYE INDUSTRY.

THERE was a decrease of 1,209,848lb., or 38.8 per cent., in the quantity of the total colour exports from Switzerland to the United States in 1918, compared with 1917, and a decrease in value of £265,000., or 36.4 per cent. There was, for the most part, sufficient raw material for the aniline colour and extract industries, and the delivery of raw materials was, under the prevailing conditions, generally satisfactory. There was sufficient coal for the factories to continue operating. Toward the end of the year, however, the situation became so critical that all factories closed for two weeks in order to save coal.

Foreign competition, particularly that of the United States, was especially noticeable during the year. However, the demand for dyestuffs was satisfactory until the signing of the armistice, when orders immediately were discontinued. This condition did not affect prices materially, for raw materials were just as dear and difficult to procure as before. The labour situation became more acute through the continual demands of the labourers for better wages and shorter hours.

There was a heavy demand for synthetic indigo throughout the year, though the English and American factories were active in competition. It is generally believed, however, says a *U.S. Commerce Report*, that with the overcoming of transport difficulties sufficient market will be found for the Swiss dyes and chemicals. Logwood was very scarce and dear throughout the year.

The growing desire among chemical manufacturers to work more unitedly in order to overcome the difficulties subsequent to the war was finally realised in 1918, when the three chemical companies—the Society of Chemical Industry, J. R. Geigy A.-G., and the Sandoz Chemical Works—consolidated for a period of 50 years. There was no consolidation of the stocks of the several companies. In order that there may be no appreciation or depreciation in the market values of the stock of any one of the former companies, the dividends in the future are to be distributed to the stockholders of the several companies in proportion to their respective earnings for the past nine years. They will buy crude products and sell the finished products both separately and jointly, but always under a joint direction. The Clayton Aniline Works, of Clayton, near Manchester, England, formerly the property of the Society of Chemical Industry, became the property of the new company. The colour formulæ of all three companies were pooled, and the Clayton plant is to be enlarged, and all dyes now made in Switzerland are to be manufactured also in England.

The technical branch of the chemical industry was marked by intensive work in all factories, and it was possible to work out formulæ for several new products which are to be manufactured in the near future.

The embargo placed on certain raw materials by the United States added to the difficulties of the pharmaceutical industry. In several cases, even after export licences had been granted, the necessary tonnage could not be obtained. Inasmuch as a separate import licence was necessary for each shipment of goods to the United States, there were often long delays and difficulties in the exportation of pharmaceuticals. Exportation to the northern neutrals was also very difficult, and for a time impossible. Eventually facilities were given by England and France for transportation. With few exceptions the foreign demand decreased throughout the year, owing especially to the increased production in other countries.

PRESERVATION OF TIMBER.

THE various methods of effecting the preservation of timber have been discussed by an American journal. The steeping process consists merely in soaking the timber in a water solution of a preservative. The wood must be thoroughly seasoned and left in the solution one day for each inch in thickness and one additional day. After treatment, the timber should be air-dried before using. Zinc chloride attacks lead paints, but is very desirable otherwise. Mercuric chloride is very effective, but is poisonous and has a decided corrosive action on steels. Sodium fluoride does not attack paint, is not corrosive, and in most other respects is very desirable. Timbers may be coated with coal-tar creosote by a brush treatment, by dipping in hot oil for five to fifteen minutes, or by the hot-and-cold bath method. This method consists in submerging the lumber in hot oil for several hours, and then either allowing the oil to cool down slowly with the wood in it or plunging the wood into cool oil and leaving it for several hours. Coal-tar creosote is objected to by some insurance companies, but whether or not it really does add greatly to the inflammability of wood is a debatable question. Creosoted wood cannot be painted over successfully, because the oil quickly comes through the paint and discolours it. Although pressure treatments are the most expensive, they are the most effective, because they result in the greatest absorption and penetration of preservative. Roof planking should receive 8lb. to 12lb. of creosote per cubic foot, or $\frac{1}{2}$ lb. of the salt if zinc chloride be used. Such treatment should add at least twenty years to the life of roof plank. Lumber should be cut to final dimensions before treatment. Whenever it becomes necessary to cut into treated timber the untreated wood exposed by cutting should be given two brush coats of creosote or some other preservative.

BORAX-POTASH FOR FERTILISER.

ACCORDING to the *Canadian Chemical Journal*, the Department of Agriculture of the United States has investigated the damage to crops attributed to the use of fertilisers containing borax-potash, and has traced in important instances this potash to the product of Searles Lake. In order to permit the safe use of this product in future, the department has, under authority of the Control Act of August 10, 1917, decided to place such restrictions on the use of potash salts containing borax as will guarantee the use of an application of not more than two pounds of anhydrous borax per acre. In order to effect this measure of safety, the department has issued instructions to the producers of potash salts at Searles Lake and to all brokers, fertiliser manufacturers, and mixers not to sell potash salts direct to farmers as straight goods when they contain more than five-tenths of 1 per cent. of borax, and not to sell mixed fertilisers containing more than two pounds of borax per ton unless the amount of borax contained is plainly shown upon the container.

This regulation is issued to insure that in no case shall a fertiliser application be made by farmers without their knowledge, which would add more than two pounds of borax to the acre. The department feels that such restrictions will make the use of potash salts from Searles Lake as safe under all conditions of agriculture as is the use of nitrate of soda, acid phosphate, and other fertiliser constituents.

A VISIT TO GERMAN CHEMICAL WORKS.

UNDER the auspices of the Glasgow Section of the Society of Chemical Industry an inaugural meeting of the new session on Friday (November 28) was addressed by Mr. D. A. Bost, who attracted a large audience to hear his description of a visit to the Rhine-land chemical works. The President of the Section, Mr. Quintin Moor, occupied the chair.

In opening his address, Mr. Bost said he was afraid that the audience might be expecting to hear more than they probably would hear. The results of the mission had been put into the volume which he had with him that night and which could be seen only from a distance. As a member of the mission, he had that volume sent to him, but had to sign a paper testifying that he would show it to nobody. Owing to the confidential nature of the report he could not go into details, but he might say that the main object which the mission set itself was to establish, if possible, the basic principle upon which the German chemical industry was founded, and to place before the British chemical industry a description of the plant and processes which would be compared by those interested with British plant and processes. It was to be expected that the Germans were not going to give away anything if they could help it, so that the members of the mission had, naturally, to be chary of accepting all they were told as gospel, but by keeping their eyes about them they were able to obtain much useful information. Another thing which was against them was that they were not allowed to take notes, and it was rather difficult to go through all sorts of plant and processes for two or three hours and then write up afterwards all they had seen.

THE BAYER COMPANY'S WORKS.

The speaker gave a very interesting description of the journey to Germany until their arrival at the Bayer Works at Leverkusen, and he pointed out that nearly the whole of the village belonged to Bayers and that it was laid out as a garden city. The directors received them in the main offices and the visitors were taken round the show places, and, while they did not really see any manufacturing process in detail, as these were mostly carried out in capsules, tubes, bottles, etc. They had expected to see a great deal of ferro-concrete work on the buildings, but they found that most of the buildings in which the products were manufactured were mostly brick, built with tiled or slated roofs. They were about forty feet high, and plant up to that height could be erected inside in any suitable place, storage tanks being supported from the floor on platforms placed where wanted. They also found a chemical library in the works, with most of the books published on chemistry since the year 1535, and they found that this firm were most assiduous in their endeavour to secure all books dealing with chemistry as soon as published. Indeed, they were interested to learn that one particular book of very great value (though not generally known) which was published in Great Britain in May, 1917, found its way to this library in June, 1917. As he had indicated, one thing which struck them very forcibly was the almost complete absence of the use of ferro-concrete in the construction of buildings devoted to the manufacture of chemicals, and the reason was that the Germans recognised the probability of changes in plant and processes and that such permanent construction might interfere with these changes. Ferro-concrete

was, therefore, only used where great strength was required or in the power-houses.

THE VALUE OF THE RHINE.

Continuing, Mr. Bost said that in Germany men talked about chemistry just as they on the Clyde talked about boats or engineering, and it was also an important fact to note that, as most engineers on the Clyde were also business men, so, too, were the German chemists business men. Undoubtedly many of their British chemists were also business men, but not to the same extent as in Germany. The foundation for the chemical industry being thus laid, it was only necessary for the Germans to find cheap raw materials, and the Rhine basin lent itself to this.

The Rhine was a swift-flowing river, with a big lime content, so that any effluent from the chemical works was quickly carried away and any acid in it was neutralised. It was navigable for many miles, and the chief centres of chemical manufacture were scattered over a length of 200 miles, from Ludwigshafen to Duisberg; while numerous small rivers and canals ran to it, these had been supplemented with railways. The Rhine was connected by the waterways mentioned above with districts producing salt, lime, coal, coke, tar, and pyrites, and it cost little to barge them down. Once these raw materials had been made into finished products, they could be sent cheaply abroad by means of the Rhine or inland by the railways. While the above circumstances were favourable to the foundation and development of the chemical industry, another factor was necessary if an electro-chemical industry was to be founded, and again in the Rhine Valley was found cheap matter for developing power—namely, brown coal, or lignite. This lignite was found in beds of immense depth, and it was only necessary to remove the soil above it and take it out with grabs or steam navvies. Before the war current was supplied to works within 30 miles of the generating station (built upon these fields) at a price which compared very favourably with the price of that produced by water-power; while, in addition to all the foregoing facts and factors, they had workmen in Germany accustomed to be ordered and to obey to the letter.

CAPITAL AVAILABLE FOR DEVELOPMENTS.

But, even with all the above advantages, the industry would not have advanced as it had done but for the capitalists, who were willing to spend money because they had faith in the ultimate result and who tackled the problem courageously even when it was evident it would take years to find a solution. The fact that until recently the services of chemists could be obtained in Germany at practically a labourer's wage was undoubtedly a factor in the large number of chemists employed, but, all the same, the German employers had recognised the necessity for employing chemists to a far greater extent than they had done in this country. Germany had also found her products protected by the fiscal laws of that country, and had conducted the business war against all opposition in as ruthless and underhand a manner as she had done in the field. Again, the Germans had a very much greater security of return for their money than they had in this country, and the owners of their chemical works were not only business men, but finished chemists, who knew the industry thoroughly. In Germany the chemist was looked up to just as an engineer was looked up to in this country, and he was encouraged and inspired in all his work.

In conclusion, Mr. Bost mentioned that the mission had visited 39 works altogether.

Dr. Heilbron, in the course of some remarks, said that they were now faced with the vexed question of whether the import of German chemicals should be allowed, and while the Government were meantime protecting the British dyestuffs industry, it was doubtful whether this would continue. He thought that if Mr. Bost could give them some information as to what was the actual state of the German dyestuffs industry at the moment it would prove very interesting—whether these works were now getting their full output and whether their research departments were as well organised as formerly. Whatever might be the position of affairs in Germany, however, the speaker personally thought that the great weakness of British manufacturers in pre-war times was that they had not given sufficient attention to research work. It was generally admitted that in heavy chemicals they in Britain still had the pull, but in the finer chemical trade they had largely allowed this to go to Germany through lack of enterprise on the part of the chemical manufacturers of this country. He did not think that the Rhine could altogether be quoted as the real reason why Germany had attained such supremacy in the dyestuffs trade; he thought that their system of technical training, and other reasons, might also be quoted. Personally, he felt that in this country they were still hampered too much by many things. There was no doubt that the German chemical manufacturers were far-seeing and thoroughly understood the value of research, and they were willing to pay for such research. His feeling was that they in this country, if they were going to maintain the position attained since the war in the chemical trade, should have strong Government support.

Dr. Cecil Desch expressed the opinion that they must all admit that the supremacy of Germany in the chemical trade in the past had been fairly earned, and their development had been largely because they were prepared to devote such an immense amount of attention to the scientific side of the industry. He, personally, did not think that the German chemists were any better than British chemists, but they received far greater encouragement as far as research work was concerned. If the British chemical industry was going to improve it would have to improve on its own merits, and we should have to be enterprising in other directions. He was afraid that so long as many British manufacturers found themselves making considerable profits they would not trouble themselves about science. He did not think that the chemical industry should look forward to protection from competition in future, but rather that the industry should be improved so that it could stand on its own merits; but they would require a great deal more scientific research than at present. The whole industry would require a great deal of reorganisation along scientific and progressive lines.

After a further expression of views by other speakers, the proceedings terminated with a hearty vote of thanks to the lecturer, and a similar compliment was also paid to Mr. Moore for presiding.

SYNTHETIC DRUGS.

THE first of three Cantor Lectures, arranged by the Royal Society of Arts, was delivered on Monday by Professor John Theodore Hewitt, Emeritus Professor of Chemistry, East London College, the subject being "Synthetic Drugs."

Professor Hewitt dealt briefly with the simple anaesthetics of the chloroform class and the synthetic alcohols, such as amylene hydrate, and chlorinated alcohols, like chlorbutol. Formaldehyde received some attention from the lecturer, who said its constitution was simple and its application very wide. Not merely was it a useful disinfectant itself, but it was the initial substance used in making a large series of drugs, such as urotropine and formamol; and, further, it had very considerable uses in the dyestuff industry.

After touching on other aldehydes, paraldehyde, chloral, etc., Professor Hewitt gave an account of some of the drugs made from ketones (sulphonal, etc.) and

from the fatty acids, and their bromine derivatives. Cyclic ureides were then considered and the veronal class of compounds. Veronal might be made by a variety of processes, he said, and the large number of patents taken out by rival firms testified to the stimulus given to organic research by the discovery of a profitable drug. The properties of the xanthine group (caffeine, theobromine) were dealt with, and the lecturer concluded with some account of the esters of the high boiling cyclic alcohols, such as borneol and menthol.

NEW TIN-EXTRACTION PROCESS.

TWO subjects affecting the future of Cornish tin-mining, says *The Times*, are at present engrossing the attention of those engaged in the industry. One is the visit being paid to Cornwall by the Government Committee inquiring into non-ferrous mines. The other subject is the discovery which is announced of a process for preventing almost the whole of the present waste of tin which occurs during extraction from the ore.

One of the great difficulties of tin-mining has been the very large percentage of loss of the metal owing to the want of efficient means of extracting it. Various improvements have been made in the plants now in use, but none of these has enabled the mines to recover more than about 70 per cent. of the tin from the ore which is stamped. The rest has flowed into the rivers, some to be intercepted by "streamers," who carry on small operations below the mines, and the remainder to go into the sea. So great has been the loss in the course of years that schemes have at times been formed for dredging the mouths of the rivers—in St. Ives Bay, for instance,—with a view to the recovery of the tin which is mingled with the sand. Though these plans have not come to fruition, there is no doubt that the tin—the waste of centuries of mining—is there.

The discovery which is now announced holds out the prospect of preventing practically the whole of this waste. The particles of tin, instead of being recovered by gravitation, are floated off from the residue of the pulped ore. Tests conducted over a long period by Mr. M. T. Taylor, the manager, and Mr. Partington, the chief metallurgist and chemist, of the East Pool and Agar mines, resulted in the discovery of an agent which floats tin oxide. A small plant has been constructed in which about 25 tons of concentrates a day are dealt with, and it is claimed that 90 per cent. of the metal is extracted.

It is hoped that the committee of inquiry will recommend some form of Government grant or subvention which will have the effect of rescuing the industry from its present state of depression. For many years difficulties have been caused by the violent fluctuations through which the price of tin has passed, and though of late the price has been high, the rise has not kept pace with the increased cost of working, and there is a real danger that an industry which has been carried on from time immemorial may be extinguished. One of the main directions in which Government assistance is looked for is in freeing the mines from water. Whether it will be possible to form a Drainage Board for the chief mining area in the neighbourhood of Camborne and Redruth, and if so whether means can be devised for rendering aid also to more isolated mines, are questions which the committee are expected to solve.

THE BRITISH DYE INDUSTRY.

LORD MOULTON'S ADDRESS TO CONSUMERS.

LORD MOULTON addressed an important meeting of dye consumers at Manchester on Friday of last week, organised by the Colour Users' Association, Mr. H. Allen, chairman of the Association, presiding.

Lord Moulton recalled that when he addressed the colour users in Manchester in December, 1914, he urged the formation of a great dye industry, which must be a national one in order that it should be able to stand up against the powerful dye industries of Germany. It should be an industry too big to crush and too national to be bribed. The danger against which he warned them had proved to be so great that the very existence of our country turned upon avoiding it. During the war he was astonished that England, so utterly unprepared with ready-made chemical industries, could respond to the colossal demands upon it, and could at once overtop the great chemical industries of Germany in a war that turned upon chemistry first of all. He had learned that, again and again, the Germans were on the verge of failure to meet the demand for ammunition, again and again they were driven from one expedient to another, and, again and again, their chemical industries came to the assistance of the nation with devices which reflected the greatest credit on their scientific power and originality.

CLAIM ON GERMAN STOCKS OF DYES.

The factories which we had to build to supply the demands of the war were now disappearing, because they were set up purely for war purposes, whereas the Germans, in their enlarged chemical factories, in the swollen establishments of all their dye firms, had a wealth remaining behind which, although created for war, was still serviceable in peace. The great German dye industry, supported by the Government very largely during the war, accumulated large stocks. England had been starved of them, except in so far as her own efforts had been able to create industries to make dyes under the difficult conditions of war time. Therefore, the first reason for the clause of the peace treaty, which gave the Allies the right to half of the existing German stocks of dyes, was to ensure that the world would not be at the mercy of Germany, because Germany possessed the only stocks of dyes. For that purpose it was provided that 50 per cent. of those stocks should be taken, by way of reparation, at a price to be settled by the Allies and to be credited to the reparation fund. The other part of the clause was intended to protect us in the future. Forty years of growth, assistance from the German Government, and our own negligence and that of other nations in regard to chemical industries, had left Germany in a position to produce special dyes to an extent far greater than any other nation could cope with. Consequently, we provided that Germany should no longer be able to corner the dye industry by ensuring that for five years 25 per cent. of their total production should be capable of being bought at the option of the Allies at a price which should be reasonable, at all events as low as the price at which they sold to any other nation.

He had been delighted to read in a German industrial publication an article protesting that it would make impossible the favourite German "full line system" of selling under which their manufacturers refused to sell a particular dye unless the customer bought all his other

dyes from them. It was exactly for that purpose that the clause was inserted. The operation of this provision was limited to five years because its purpose was to stir up England to help herself. To extend the provision over a long series of years would lead us to put off the time when we should apply ourselves to the formation of this industry. If the industry could not within five years become strong enough to bear its burden, and to hold its own against the chemistry of Germany, it did not deserve assistance. But he was satisfied that, after that period, we should find ourselves capable of doing all that Germany could do. The time had already come for the 50 per cent. provision of the treaty to be carried out. He had been invited by the Board of Trade to be the English representative at Paris on the committee which was dealing with the 50 per cent. and its division among the Allies. That committee had agreed, without prejudice to the ultimate proportion of the shares, that certain advances should be made out of these stocks. Italy, France, and Belgium together were allotted 2,200 tons, Great Britain had the right to 1,500 tons, and the United States also 1,500 tons. The first consignment of our 1,500 tons, he believed, was now on the eve of arriving in this country. He did not think there was any foundation for the idea that other nations were getting their share more quickly than ourselves.

DYE MANUFACTURE IN GREAT BRITAIN.

Regarding the amalgamation of British Dyes, Limited, with Messrs. Lévinstein, Limited, Lord Moulton said this great concern had, in his opinion, such a staff that there was no dye of any importance which they were not prepared to make when they had the plant. The idea that there were secrets unknown to them, the ignorance of which paralysed their efforts, was absurd. It was naturally true that the experience of the Germans had given them skill in getting the last bit of yield out of a combination. We had to learn, and we should learn. It must be remembered that the German combine was one not only of dyeworks, but of chemical works of all kinds, pooling their profits, and capable, therefore, of selling any particular class of things at a loss if necessary, in order to destroy a formidable growing industry in a foreign country. Such a combine as that was sure to give the British company trouble.

He was not surprised at the attacks made in some quarters upon the company. He never expected that England would take up the job of fighting the huge combine that existed in Germany without the persons who were doing it, catching it. One attack which made him very indignant was a suggestion of watered capital. It was utterly unjustifiable and absolutely untrue to suggest that there was anything like watered capital in the company. Dealing with complaints by users that they could not get the quantities they received before the war, he said it was impossible for a company so young at once to give a full range in such quantities as might be demanded. Increase in range was not the solution, because they could give a very large range indeed in quantities insufficient for the industry. They had to aim at satisfying the demand in quantity as well as in the nature of the dyes, and they were doing that as fast as they could. They produced more indigo now than England could consume, and he asked them to compare that with the position four years ago. When he spoke to them last, England produced only one-tenth of the dyes they wanted. He was informed that, by the end of this year, they would be able to turn out within

one-fifth of the amount that England used before the war. The tables were turned. The margin that they wanted importing was a small part; that which they made was the bigger. That, he said, was not a bad account of work done under the paralysing influence of war, and the almost equally paralysing influences of the last few months.

In acknowledging a hearty vote of thanks, Lord Moulton said there had been a good deal of complaint regarding the high prices now asked for dyes. If, however, they considered that two of the prime materials used in their manufacture, benzole and naphthaline, had increased five and four times respectively, they could not say that the high prices were unfair prices.

ANALYSIS OF RESIDUAL ACIDS FROM ETHER MANUFACTURE

AFTER determining the sp. gr. of the liquid, in accordance with a method described by E. C. Carron (*Ann. Chim. Anal.*, 1919, 1, 282-288), the free sulphuric acid is estimated by diluting 5cc. of the sample to 100cc. with water below 15° C., raising the temperature to 15° C., treating 5cc. of the dilute solution with 15cc. of 6 per cent. barium hydroxide solution, and centrifuging the mixture for thirty minutes. The clear liquid containing the barium sulphovinate in solution is decanted, and the precipitate washed with 10cc. of $\frac{N}{5}$ hydrochloric acid to dissolve the excess of barium and any barium carbonate, again centrifuged with water, washed, and finally centrifuged with water, ignited, and weighed. The amount of free sulphuric acid is calculated from the weight of barium sulphate.

Distillation.—150cc. of the sample are distilled between 85° and 90° C., and the distillate collected in a condenser chilled with a freezing mixture to -10° to -15° C. The distillate is brought to 15° C., the volume read, and water then added drop by drop with continual shaking until a permanent turbidity is produced, when the volume is again read. From these data the relative amounts of water, alcohol, and ether are found by reference to a graph constructed by Hascoet from empirical determinations.

Acidity in the Residue.—An aliquot portion of the residue in the flask is titrated with standard alkali, with methyl orange as indicator, and the results are expressed as sulphuric acid. The difference between this result and the free sulphuric acid previously estimated, multiplied by 1.285, gives the amount of sulphovinic acid.

Ether is estimated by distilling 25cc. of the sample from an ether bath, provided with a reflux condenser, at 35° C., with the aid of a slow current of air, and collecting the distillate in a U-tube with one very narrow limb. This contains 8cc. of a nitrochromic reagent, and is immersed in ice-water. The reagent consists of 1.2grms. of sodium and ammonium dichromate, 20cc. of water, and 180cc. of nitric acid (sp. gr., 1.33). The depth of the coloration produced through the formation of chromic nitrate is compared with that given by a range of colorations produced under the same conditions by mixtures of 15 per cent. alcohol with variable quantities of ether. The readings should be made within ten minutes after the ether has distilled, and at a temperature of about 0° C., and it is essential that the current of air should always be drawn through the reagent tubes at the same speed.—*The Analyst*.

INDIAN SESAMUM AND GROUNDNUT CROPS.

THE second sesamum forecast, 1919-20, issued by the Department of Statistics, India, is based upon reports received from provinces which contain on an average 76 per cent. of the total area under sesamum in British India. The returns in this forecast exclude the estimates for the "mixed" crop of the United Provinces, and for the late crop of Bengal and Madras. The final memorandum, which will be published in January, will include, as usual, returns for these crops.

The total area so far reported for the present season is 2,170,000 acres, as against 1,603,000 acres (revised figure) at this time last year, or an increase of 35 per cent. Details of the area by provinces are given below:—

SECOND FORECAST, OCTOBER.

Provinces.	1919-20.	1918-19.	Increase + or Decrease —
United Provinces (unmixed crop).	175,000	125,000	+50,000
Madras	616,000	400,000	+216,000
Central Provinces and Berar	463,000	491,000*	- 28,000
Bombay (including Indian States)	455,000	190,000	+265,000
Bengal (early crop)	167,000	169,000	- 2,000
Bihar and Orissa	168,000	138,000	+30,000
Punjab	82,000	67,000	+15,000
Sind (including the Khairpur State)	32,000	20,000	+12,000
Ajmer-Merwara	12,000	3,000	+9,000
Total	2,170,000	1,603,000*	+567,000

* Revised figure.

Weather conditions have not been quite favourable for the crop, which suffered from heavy and continuous rain in the important sesamum-growing tracts of the Central and the United Provinces; and the present condition of the crop, on the whole, is reported to be fair.

The first groundnut forecast, 1919-20, is based upon reports received from the three provinces of Madras, Burma, and Bombay, which comprise 99 per cent. of the entire groundnut area of British India. The total area sown in the present season in these provinces is estimated at 1,274,000 acres, as against 1,147,000 acres estimated at this date last year, or an increase of 11 per cent. Weather conditions have been favourable, and the condition of the crop is reported to be good. Details for the provinces are stated below:—

FIRST FORECAST, OCTOBER.

Provinces.	1919-20.	1918-19.	Increase + or Decrease —
	Acres.	Acres.	Acres.
Madras	919,000	821,000	+98,000
Burma	235,000	236,000	- 1,000
Bombay (including Indian States)	120,000	90,000	+30,000
Total	1,274,000	1,147,000	+127,000

FERTILISERS IN SOUTH AFRICA.—South Africa, prior to the war, imported large quantities of various kinds of fertilisers and, in fact, almost entirely depended on outside sources for its requirements in this direction. During the war these imports decreased to an alarming extent, the tonnage for 1914 being 59,651, and for 1917, 9,077. Experiments in regard to the production of basic slag and the exploitation of phosphate deposits are being conducted by private companies in various parts of the Union. It is understood that the general attitude of the Government is to leave such questions as the supply of fertilisers to the action of private enterprise.

INSTITUTE OF CHEMISTRY.

ANNUAL MEETING OF THE BIRMINGHAM SECTION.

THE annual meeting of the Birmingham Section of the Institute of Chemistry was held on Monday evening at the rooms of the Chamber of Commerce, Birmingham, Dr. E. W. Smith presiding.

The annual report, read by Mr. F. C. A. H. Lantsberry, M.Sc., hon. secretary, stated that since its inauguration in November last year the Birmingham section had done excellent work. From the outset the committee decided that in matters of technical and scientific interest it would co-operate with the Birmingham and Midland Section of the Society of Chemical Industry, and would largely devote the attention of the section to discussion of professional matters, and to the organisation of the local qualified chemists. With the committee's approval, the Council of the Institute appointed Professor Frankland, Mr. H. Silvester, Dr. Twiss, Dr. Smith, Mr. F. R. H. O'Shaughnessy, and Mr. Lantsberry to act as a committee to interview local applicants for admission to the Institute without examination and to advise the Council as to their suitability for election. The committee had interviewed a number of candidates. Professor Frankland had expressed his desire not to act on that committee, and the committee had requested the Council to add the names of Professor Morgan and Dr. Slater Price to the committee. The number of members of the Institute who had definitely joined the local section stood at 50. This was to be regarded as satisfactory for the first year of working, but the committee hoped there would be a good influx of members in the near future. The report was unanimously approved; Mr. N. P. Booth and Mr. S. R. Carter were appointed to the committee, two other vacancies to be filled later; and on the motion of Mr. H. T. Pinnock, seconded by Mr. H. Silvester, Mr. Lantsberry was unanimously re-elected hon. secretary.

SOCIETY OF CHEMICAL INDUSTRY.

BRISTOL AND SOUTH WALES SECTION.

AT the last meeting of the Bristol and South Wales Section of the Society of Chemical Industry two subjects were brought under discussion—"Sulphur Burners" and the question of "Chemical Engineering."

Mr. Hawkes described fair types of burners, two of the fixed variety, and two movable, and gave some results obtained in burning sulphur on the small scale, indicating how different forms of sulphur behave, the combustion in certain cases being very incomplete, as shown below by one example from figures given.

	Residue	Unburnt.	Ash.
Form A	3.5		0.02
Form B	50.0		0.60

Mr. Humphries gave further information as to the working of sulphur burners, with special reference to the rotary type, dealing more particularly with the question of sublimation.

Professor Hinchley, speaking on chemical engineering, deplored the lack of skilled chemical engineers, and stated that, in spite of the progress made in this country, there was a large amount of plant produced with ease on the Continent which we seemed unable to manufacture successfully. He suggested that what was wanted was a man, not a first-rate chemist or a first-rate engineer, but a man who combined both branches of knowledge in

himself sufficiently to enable him to interpret from one branch of science to the other, at the same time calling in the pure chemist or the pure engineer to consult on any specifically chemical or engineering problems. In the past the chemist and the engineer had been unintelligible to each other; the chemical engineer would provide the "missing link."

OIL-SEED CRUSHING INDUSTRY.

AT the Royal Society of Arts on Wednesday, Mr. John Westall Pearson, chairman and managing director of the British Oil and Cake Mills, read a paper on "The Oilseed Crushing Industry." The seed-crushing trade, he said, was probably one of the oldest industries in the world, and yet it was left for the war to bring about a recognition of its vital importance. The most important developments had been connected with the edible oil refineries. Refining plants made much more rapid progress in North Europe, where the use of oil for edible purposes was so much more general than in England. The consumption of margarine in England to-day, however, was more than three times what it was at the outbreak of war, and the margarine manufacturing plants were now capable of producing over 10,000 tons of margarine per week, whereas not more than 2,000 tons were produced before the war. The enormous increase in margarine and edible fats manufactured in England had created a demand for fine edible oils far in excess of that which previously existed, and, while in past years considerable quantities of the finer oils were manufactured in North Europe and shipped to England, it was hoped that the manufacture of these oils in England, being so largely the product of raw materials grown in our own Colonies, would be retained as a permanent trade for the United Kingdom. Up to the outbreak of war the seed-crushing industry was carried on in this country principally for the sake of cake production. The last five years had brought about a substantial change. Numbers of new plants had been erected whose major object was the production of oil.

The major portion of the oilseed crops of the world, said Mr. Pearson, was produced within the British Empire. The total consumption of oils for industrial and edible purposes in Great Britain was estimated at 600,000 tons per annum. No system had yet been discovered which would enable the whole process of oil manufacture to be conducted automatically from the cooking kettle to the point of oil expression, and this was the stage where there was much scope for economy in manufacture. But in a well-appointed mill, on a pre-war basis, the whole operation of receiving, crushing, cooking, pressing, oil-filtering, and delivery of the produce, inclusive of interest on capital employed, depreciation, power, labour, consumption of stores, and all general working charges, could be carried out for less than £1. per ton.

DUST IN FACTORIES.—The dust in various industrial establishments is found by Professor Winslow, of Yale Medical School, to range from about one-twentieth of a grain of solid particles per 100 cubic feet of air in a good metal polishing shop to twelve grains in a textile factory. But while a carpet or blanket mill yields more dust than such industries as pottery, asbestos, tobacco, and steel-grinding, little of it is inorganic matter, and it is the dust from abrasive materials that seems most harmful and to tend most to produce tuberculosis.

CORRESPONDENCE.

***We do not hold ourselves responsible for the opinions expressed by our correspondents.*

Pulverised Coal.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—May I be permitted to refer to Mr. Harald Nielsen's remarks on the subject of pulverised coal as recorded in the current number of your journal?

Mr. Nielsen is certainly correct when he states that probably American engineers originally got the idea of pulverising fuel from Europe, and he is also right in saying that many installations have existed in England for years where fuel has been burned in this manner. Everyone knows that pulverised coal has rendered the rotary kiln a successful means of burning cement clinker, and that this application affords a simple means of turning the "ash" contained in the fuel into a profit-bearing substance. Mr. Nielsen does not, however, appear to realise that whereas cement-burning in this manner has presented no difficulties whatever—apart from the costly experience gained in preparing and handling the fuel,—yet British, French, South African, German, and men of other nations have attempted over the past 100 years, and failed, to successfully apply pulverised fuel to metallurgical furnaces, stationary boilers, locomotives, and many other purposes. American engineers have definitely solved all the old troubles, and have done so during the past few years.

In America, quite apart from the cement industry, there have been erected, practically during the war period, some hundred installations, embracing open-hearth steel melting, reheating, annealing, puddling, Bushelling, malleable-iron melting, galvanising, and tinning furnaces. All the Anaconda copper-smelting furnaces are pulverised-coal fired, some 1,200 tons per day being used at these works alone. Locomotive equipments have been developed, and the fuel has been tried out on marine boilers. That England is considerably behind is evidenced by the fact that but three plants have been put up during the past twelve months, not one of which is giving complete satisfaction to the owners. Why? Because American experience has not been relied upon to the fullest extent.

That pulverised coal can be dangerous under certain conditions is irrefutable; but iron and steel plants in America, notably the one at Lebanon, have run for sixteen years without any serious accident. Powdered-coal plants can be made as fool-proof as oil or gas plants. Prevent the pulverised fuel from mixing with air until one wishes it to burn in the furnaces, and there can be no possible danger of explosion. Spontaneous combustion is only aggravated when the fine fuel is stored hot from the pulveriser. If stored cold, but a very few coals will give any trouble in this direction. The safe duration period for storage entirely depends upon atmospheric conditions, temperature, and nature of the fuel, for each of which factors "American" experience can apply the remedy. America has found a satisfactory method for delivering pulverised coal daily, weekly, or as required from central supply stations; so why should a system based upon similar practical lines fail in England? Pulverisation to a fineness that but 3 to 5 per cent. residue will remain on a 200-mesh sieve is a standard required for steel open-hearth furnace work only if ash trouble in chequers is to be minimised to the fullest extent.

Returning again to the question of powdered-coal storage, Mr. Nielsen considers that storage in bulk will present an "insurmountable difficulty at any rate for some years to come." Why should this difficulty not be solved within the next twelve months if it has not yet been removed? H.M.A.S. *Skylark* bunkered powdered coal in fair bulk during the war for considerable periods without spontaneous combustion taking place, and bins holding 30 tons of powdered coal have lain idle for several months at Sharron and other places in the U.S.A.—Yours, etc., L. C. HARVEY.

25, Victoria Street, Westminster, London, S.W. 1,
December 2, 1919.

Heat Economy in Chemical Plants.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Mr. Nielsen has evidently only read your abstract of my paper on waste-heat boilers, etc., which was published in

full in the *Journal* of the Society of Chemical Industry of July 31, 1919, and I have therefore forwarded a reprint of it to him.

I have not recommended temperatures as low as those stated by Mr. Nielsen, and there are no nitrogen compounds in furnace gases. Even nitrogen compounds in gas-engine exhausts are safe at about 200° C., as Mr. Nielsen should know, and for lower temperatures my paper indicates how corrosion can be prevented. As regards pulverised coal, the object of my paper, as stated therein, was only to bring out salient points and useful facts and figures, and not to indulge in controversy. The best answer to Mr. Nielsen's objections to powdered fuel is that in America alone 11,000,000 tons are being burnt annually, and that the Fuel Research Board's first report is a long and valuable one on pulverised coal, which completely contradicts Mr. Nielsen's statements. It is a matter of common knowledge that powdered coal has been largely used for many years in cement kilns; but if Mr. Nielsen has any practical experience of results obtained by, or defects in, modern waste-heat boilers and powdered-fuel plant, let him contribute an article to the technical press on the subject. I can find little in the context to justify the title used for Mr. Nielsen's article, and his misstatements and misconceptions are of so glaring a nature that I feel that it would be waste of your valuable space to reply to them fully. The chief source of wonder to your readers must be not "why I wrote my paper," but why Mr. Nielsen has got no further than discussing an abstract of it four months after it appeared.—Yours, etc., C. J. GOODWIN.

60, Mark Lane, London, E.C. 3, November 29, 1919.

The Anti-Dumping Bill.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—The Anti-Dumping Bill is a profound disappointment to me, as I feel convinced that if it is passed in anything like its present form it will do infinite harm to all industries in this country for the following reasons: It sets up an enormous and expensive bureaucracy (the cost of which no one can foretell); it attempts to treat individual manufacturers in an industry instead of dealing with the industry itself (and this in practice is almost sure to mean partial administration); it will place a heavy burden on all firms affected—constant negotiations with the Board of Trade (involving such additional labour on those controlling the industry as well as on the staff), journeys to London, the filling-in of innumerable forms, etc.; lastly, but most important of all, it postpones the great need not only of all British industries, but of all classes in the country, of a settled industrial policy to which the nation can work and for which plans may be laid well in advance. Periodical changes in the tariff—which are called "fees" in the Bill—mean in practice that manufacturers will not know from one three months to another where they stand.

I am firmly convinced of the pressing need under present conditions for adequate protection against dumping in Britain and for promoting the maximum production in our industries, including agriculture. My opinion of the Bill as it stands is that it will place the maximum of obstacles in the way of British industry, that it will permanently place our industries in the grip of State bureaucrats, and that it will provide the minimum of advantage to British production.

I hope that the Bill may be withdrawn, and a simple, straightforward, and more permanent scheme for developing the productive capacity of this country substituted.—Yours, etc., RICHARD A. COOPER.

6, Carlton Gardens, London, S.W. 1,
November 29, 1919.

AUSTRALIAN IMPORT DUTIES.—The Board of Trade have received, through the Colonial Office, copy of a Bill to amend the Customs Act, 1901-16, which was read for the first time in the Commonwealth Parliament on August 7 last. The Bill proposes, *inter alia*, to repeal Sections 154-6 of the principal Act and to substitute new sections. These sections relate to the basis of valuation of goods for the purpose of levying *ad valorem* duties on their importation into Australia. In the proposed sections no new principle of valuation is introduced, but the order of the provisions has been re-arranged and some other amendments made with a view to making quite clear the basis on which duty is payable, and reducing the number of investigations in the country of export, and so avoiding the consequent delay in the adjustment of duty.

ITEMS OF INTEREST.

UNITED STATES PRODUCTION OF GYPSUM.—The American production of gypsum in 1918 was nearly 24 per cent. less than in 1917, the output having been 2,057,015 short tons, valued at £2,294,000., compared with 2,696,226 tons, valued at £2,223,000. in the preceding year.

ZINC AND ZINC DUST PRICES.—Australian high-grade zinc dust (88-92% metallic zinc) continues in demand at £75. per ton. The price of Australian electrolytic zinc (99-95% purity) remains at £44. per ton f.o.b. Australia for direct shipment to New Zealand, India, South Africa, and the Far East.

MANURE FROM SEWAGE SLUDGE.—An interesting commercial experiment in the production of manure from sewage sludge, is to be made at the works of the Birmingham Tame and Rea District Drainage Board, who have just entered into an arrangement with the British Organic Fertilisers Ltd., who intend to instal plant.

JAPANESE CELLULOSE SUBSTITUTE.—A company has been formed in Japan, with a capital of 100,000 yen, for the manufacture of celluloid substitute, based on the utilisation of albumen obtained from soya-beans, which are available in large quantities at a very low price. The product is stated to be adapted for the same uses as celluloid.

BRITISH ASSOCIATION OF CHEMISTS.—The Bradford and Leeds Section of the British Association of Chemists has held a meeting at the Hotel Metropole, Leeds, for the purpose of increasing the membership of the organisation. Mr. A. C. Wilkinson, of Bradford, presided, and he was supported by Dr. E. P. Hedley, of Derby, Dr. R. B. Forster, of Manchester, and Mr. H. Jennison (secretary), of Bradford.

OIL COMPANY'S DEVELOPMENT.—The Valor Company, of Aston, has bought from the Birmingham Tame and Rea Drainage Board 40 acres of land at Bromford, near Birmingham, for the erection of a factory and workmen's cottages. Alderman Sayer, chairman of the Board, stated that the Valor Company was associated with one of the largest oil-producing companies in the world, and big developments were in prospect. Facilities would be given for the construction of a railway siding on the Midland Railway line.

PATENT OFFICE LIBRARY.—At the conclusion of the meeting of the London section of the Society of Chemical Industry, on Monday, a petition in favour of the Patent Office Library being kept open until 10 p.m. as in pre-war days, was presented for the signature of the members, who appeared to be strongly in favour. The Presidents of the Society of Chemical Industry and the Chemical Society have formally signed the petition on behalf of their respective societies, and when complete it will be presented to the President of the Board of Trade.

RAILWAY INEFFICIENCY.—In a letter to *The Times* Mr. G. E. Howard, of Messrs. Howards and Sons (Limited), chemical manufacturers, Ilford, says: "The whole trading community is groaning under the utter inefficiency of the Government control of railways. Every day we receive letters from customers all over the country bitterly complaining of delays in delivery of our goods. To-day we think the record has been broken, since we hear from Wakefield that a small consignment of chemicals dispatched from here by us on June 12 reached its destination on November 24. What the result would be of nationalising the railways and placing the organisation completely into the hands of Government officials, one hardly dares to contemplate."

IMPERFECT PROTECTION OF WOOD.—Wood is not wholly protected from moisture by varnishing, which is shown by tests of the U.S. Forest Products Laboratory in Wisconsin to have only a retarding effect. The woods used were yellow birch, basswood, red gum, African mahogany, white ash, white pine, sitka spruce, southern yellow pine, bald cypress, incense cedar, white oak, western yellow pine, Port Orford cedar, and sugar pine; but there was no perceptible difference in the different species in the moisture absorbed through the coating. Three coats of high-grade spar varnish were applied to four panels of each species, two panels being brush-coated and two dipped with a special machine designed to give an even coat. The panels were dried 72 hours between coats and 10 days after the final coat; and were then exposed 17 days to an atmosphere practically saturated with moisture. The brush-coated panels all absorbed between 5 and 6.5 grammes of moisture per square foot of surface; the dipped, between 4 and 5 grammes.

BUSINESS NOTICE.—We are informed that as Mr. S. F. Waters is taking a less active part in the business of S. F. Waters and Co., 85, Gracechurch Street, London, E.C., he is admitting into partnership his two sons, Mr. Eric Noel Waters and Mr. Hardy Bedwell Waters, who for the past four years have been serving in France and Belgium with the forces, and Mr. Philip William Milner, who has been associated with Mr. Waters for fifteen years and with the army for the last two years.

CEITUARY.—We regret to announce the death of Dr. Jacob Grossmann, consulting chemist and chemical engineer, of Manchester. Dr. Grossmann was a practical authority on the question of sewage disposal, and during recent years was also closely interested in the problem of nitre-cake utilisation, a number of patents having been taken out by him on this subject. He was an original member of the Society of Chemical Industry, and was well known to the members of the Manchester Section of that society.

CATALYTIC REDUCTION OF HALOGEN ACETIC ESTERS.—In the course of a communication on this subject to the French Academie of Sciences, MM. P. Sabatier and A. Mailha said that at 300° C. ethyl chloroacetate can be reduced by hydrogen in presence of nickel to ethyl acetate, some aldehyde and ethylene being formed by secondary reactions. Under similar conditions ethyl dichloroacetate can be reduced to the monochloroacetate, and ultimately to ethyl acetate. The reaction can also be applied to ethyl trichloroacetate and ethyl bromoacetate.

TEACHING OF METALLURGY AT NEWCASTLE.—Professor Henry Louis, speaking at a meeting of the Newcastle branch of the Institution of British Ironfounders, said it was a matter of profound regret that, at Armstrong College, Newcastle, there was not the proper equipment for teaching the science of metallurgy as it ought to be taught. The metallurgists in the North-east district did not appear to have realised what they owed to themselves and their industry, no less than to the leading educational institution in the district. They had never made the slightest effort to equip a metallurgical department worthy of that important industry. A properly staffed and properly equipped metallurgical department would be the centre of research for the entire district. He urged, as a business proposition, that it would be worth while establishing such an institution where problems could be worked out which would benefit the industry as a whole.

OIL SHALE IN MONTANA.—One of the few places where a plant has already been installed for the distillation of oil from shale is near Dillon, Montana, states the United States Geological Survey. The shale at the site selected for the operations is a part of the phosphate formation, which contains the beds of rock phosphate that are mined at several places near Bear Lake, in south-eastern Idaho, for the manufacture of fertiliser. Phosphate beds are also associated with this shale in the vicinity of Dillon, and although they are neither so thick nor so rich as the beds in south-eastern Idaho, they have some prospective value. Soon after it became known that there was shale in the Dillon region from which oil could be distilled, certain promoters began to organise companies to drill for oil in that region, and the search has been carried on persistently in spite of the fact that the geological conditions there are almost wholly unfavourable to the occurrence of oil.

LEAD POSITION AND PROSPECTS.—A remarkable change, says *The Times*, has taken place in the position of lead during the past few months. In the early part of the year there was a superabundant stock of lead in the world, largely in the hands of various Governments. With consumption at a very low point these stocks, with the expectation of a reasonable maintenance of production, were a serious menace to the market, which showed signs of being overburdened, and prices fell heavily. Under the stimulus of low prices, consumption quickly revived throughout the world, particularly in the corroding and electrical industries, and it has assumed very large proportions. Simultaneously, owing chiefly to labour troubles, production has fallen rapidly; and with the drop assuming serious dimensions, instead of a market overburdened with supplies, there are now serious fears of a scarcity. The outlook suggests the necessity of replenishing supplies from America, as there are still no signs of a resumption of work at Broken Hill; and even if there were, the output will be very low for some time to come. It is understood that the Government policy is to do everything possible to restrict exports of lead until such time as the outlook becomes clearer.

PRICE OF POTASH SALTS INCREASED.—It has been found necessary to modify the terms on which the high-grade potash salts recently acquired by the Government from Germany in exchange for food, will be sold in Great Britain. On and after December 1 the prices announced by the Board of Agriculture and Fisheries in Leaflet No. F. P. 494/S. 1 will be raised by 5s. per ton. Manure mixers, merchants, dealers, and co-operative societies should in future send their orders to the Fertiliser Manufacturers' Association, Ltd., 155, Fenchurch Street, London, E.C. 3.

LUBRICATION INVESTIGATION.—In addition to routine work on lubricating oils, a great deal of effort has been given by the U.S. Bureau of Standards to the testing of lubricants used in the dynamometer laboratory. The results obtained appear to indicate that airplane engines consume oil faster than they deteriorate it. Apparently, this is the case with both paraffin and naphthene base lubricants. Progress has been made in the standardisation of the Waters oxidation test, and the indications are that it will be possible to carry out this test with very small and inexpensive apparatus.

SALE OF AMMONIA-SODA COMPANY'S WORKS.—Messrs. E. Rushton, Son, and Kenyon, at the Albion Hotel, Manchester, on Tuesday, offered for sale the freehold estate and works of the Ammonia-Soda Company, Limited., at Plumbley and Lostock Grlam, including the Manor of Holford. The land at Plumbley, on part of which the works are erected, comprises a total area of 159½ acres, and there are also two plots of land with wharf on the canal and a cottage at Lostock Grlam, containing 1½ acres. All the property is freehold and free from chief rent. Included in the sale was the plant and machinery, laboratory, mechanics', smiths', and joiners' shops, and the stock. The price obtained was £110,500.

FATALITY.—The Birmingham City Coroner (Mr. Isaac Bradley) on November 28 conducted an inquest respecting the death of Frank Ernest Sevier (33), machine oiler, who died at the Queen's Hospital on Tuesday from extensive burns received while following his employment at Hales Owen Steel Works. Sevier told his wife that he slipped and fell into the pickling tank, which contained a pickling solution of about 10 per cent. of sulphuric acid to a depth of 3ft. The works engineer stated that the pickling solution was kept hot by steam pipes, and was used for cleaning brass rods. When the machinery was being oiled it was stationary. The oiler stood on the edge of the tank. Following the accident, Sevier got into a pool at the rear of the acid tank, and said he did so because he was so hot. It was stated that to obviate a similar accident in the future a mechanical oiling apparatus had been installed. A verdict of "Accidental death" was recorded.

SURFACE TENSION OF OILS.—A new method of determining the surface tension of oils was recently described by K. Grunmachner and W. Bein in Vol. LX. of the Scientific Transactions of the Imperial Standardising Commission, Berlin. Two glass plates were vertically mounted on a base; by means of screws they can be moved so as to form a wedge of a small adjustable angle. The oil is fed into the space between the two plates and rises by capillary attraction, the liquid boundary taking the shape of an equilateral hyperbola. In order to facilitate measurements, a series of confocal hyperbolæ is photographed on one of the glass plates. To hasten the settling of the oil, which may take a long time, the plates are moved to and fro by means of a micrometer screw. The surface tension values thus obtained for various oils—turpentine, olive, resin, castor, hemp oil, etc., and also benzene—agree with the values determined by Wilhelm's meniscus method. —*Engineering*.

FIRES.—Owing to the overhear of a boiler, there was a serious and disastrous outbreak of fire in the premises of Messrs. T. and W. Farmiloe, Ltd., paint, glass, and white lead works, of 88, Nine Elm Lane, S.W., last week. The damage was very heavy, and would have been very much more serious except for the prompt arrival of the fire brigade, with a large force of men and motor appliances from all the surrounding stations. At Hull a fire occurred on the steamship *Queen Maud* while the vessel was discharging oil. There were large quantities of paraffin, lubricating oil, and colza oil on board, but the flames were confined to the store room, bunkers, and the engine-room. The damage was considerable.—On Monday night considerable alarm was caused in Alloa by an outbreak of fire in the Alloa Copper Works, situated in Bridge Street. The ventilating shafts on the roof of the main workshop were ablaze, and the roof soon caught fire. Strenuous efforts were being made to confine the flames to the copper works.

TUNGSTEN AND MOLYBDENITE (SUSPENSION) ORDER, 1919.—The Minister of Munitions has suspended the operation of the Tungsten and Molybdenite Order, 1917, which dealt with tungsten-bearing ores and tungsten metal alloys and salts, and molybdenite and molybdenite metal, alloys, and salts as from October 17, 1919.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The demand for coke for export which renders the coking and by-product industry more independent of the pig-iron industry in Cumberland and North Lancashire than has ever been the case for many years has come at a time when the coal position is by no means a good one. The reduction of the price of household coal hits the Cumberland collieries very hard, for to the ten per cent. of the output which goes to local landsale there has to be added the 25 per cent. of output which is absorbed by Ireland. Part of the latter has been steam coal and part household coal, but Irish merchants now refuse to accept other than household coal. Cumberland coal owners are equally determined that the proportions which have been observed before shall obtain still. The result is that very little coal is now being shipped to Ireland, and there is being thrown on the local market far more coal than can be used. How long this state of affairs will continue it is impossible to say, but naturally there is much confusion and it seems certain that some weeks must elapse before things are straightened out again. Meantime the make of coke is gradually increasing, and directly trucks can be secured to enable shipments to be made on the East Coast it is believed that all the ovens will resume full activity. At present some of them are working at less than a third of their capacity. The local absorption of coke remains about normal, with a tendency to become smaller as the depression in the iron trade deepens. East Coast coke supplies to West Cumberland this week are 5,000 tons and to the Furness district, 15,000 tons. There is a brisk demand for benzole, and the make is insufficient to meet requirements. Sulphate of ammonia is a fair market.

THIRTY YEARS AGO.

From the "Chemical Trade Journal" of December 7, 1889.

Liquid Fuel.—Oil for locomotives in place of coal will be largely introduced on one of the southern railways soon. It is probable also that petroleum refuse will be used for fuel, in consequence of the high price of coal.

The Manufacture of Sugar by Diffusion.—The Washington Department of Agriculture has just issued a report on the work done at the Magnolia Plantation in Louisiana during the past year in the manufacture of sugar by the diffusion process, which is described and illustrated in great detail. In 1885 the attempt to introduce the process failed by reason of defective machinery. In 1886 Louisiana cane was sent to Kansas, and there treated by the new process. It yielded fully 30 per cent. more than by the usual milling process. In 1887 diffusion was successfully introduced into Louisiana, and it is to this that the report refers. During the current year it will be at work in four Louisiana plantations. The practical result is that while previously the average yield of sugar per ton of cane on the best plantation was scarcely 145lb., it is now over 200lb. Moreover, there is already growing up a more scientific agriculture, a better knowledge of the problems of sugar manufacture, a more scientific method in the sugar house, and the introduction of improved machinery.

Smokeless Powders.—They promise to be as numerous as explosives of the nitro-glycerine group. Every new moon brings into being a new smokeless powder; and, if we may believe the accounts of it, that now invented by Herr Swab, of the Stein powder factory in Austria, beats anything of the kind in point of efficiency. It burns slowly in the open air, giving off so light a smoke that it resembles the haze above an ordinary chamber lamp. It has scarcely any smell; but it ignites with extraordinary rapidity, giving to a projectile an initial velocity of 630 metres (693 yards), instead of 530 metres (583 yards). The invention of another smokeless powder by Herr Siersch is reported from Presburg, in Hungary. It is described as "slate-coloured triple azotate" (nitrate), and "most powerful."

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—Although in normal times, before the war, the country dealers were in the habit of making "forward" purchases for spring delivery, they are showing no interest in the Chilean fertiliser at the present moment, the bulk of the small business passing being for export. The chief cause is, naturally, the extremely high price of the commodity compared with that of sulphate of ammonia, which latter has, moreover, for several years been extensively, and with satisfactory results, used as a substitute by the British farmer. In spite of the enhancement curiously enough decreed by the Board of Agriculture—and still, it may be added, accompanied by vexatious formalities,—sulphate is in nitrogenous contents far cheaper than nitrate, and the preference given to it is therefore not to be wondered at. Owing to the currency depreciation already referred to in these columns, nitrate of soda is very much dearer abroad than in this country, yet there is said to be an active demand on the part of Continental consumers, this, however, not applying to Germany and Austria, formerly the largest buyers, since it is officially admitted that they are altogether out of the market. Some mystery still attaches to the total of sales made in Chili by the Nitrate Producers' Association, the figure of 25 million quintals, or 1,140,000 tons, named at the recent meeting of the Santa Catalina Company being considerably below that hitherto reported. So satisfied, nevertheless, is the Association with the progress made that it has decided again to raise its limits—the third time since the institution of "fixed prices" three months ago,—and confidence is expressed in an early rehabilitation of the industry. The crux lies in the supply of tonnage, and the publication of the November shipments from Chili, together with the "loadings," is awaited with more than ordinary interest. The reinsurance rate on the *Cap Horn*, mentioned in our last issue, has risen to 50 quineas per cent.

German Potash and American Buyers.—The fuel question, which is so severely paralysing the German output of potash, it is sought to assuage by the use of heavy oil-engines, which might be installed with the aid of the Government for the particular purposes of helping the exchange situation. It is stated by United States representatives in Berlin that that country is ready to accept delivery of a milliard marks value in potash. The point made in connection with this is of peculiar interest when we remember the struggle that took place between the American potash people with the German Government for possession of certain potash properties in Germany—viz., there is no danger now of such a conflict, because the mere fact of the socialisation situation in Germany as it affects even the potash concerns rules out the possibility of any potash concern in the country acting independently.

Sulphate of Ammonia.—This material still moves off steadily, the higher prices which are to prevail in the near future certainly tending towards earlier trading. Amounts available for export are declared to be scarce, and manufacturers are reported to have as many orders in this department as they can conveniently handle at the time being. The export price is still declared to be round about £25 per ton.

Potassic Super.—This material, which has been mentioned more and more of late, has apparently an increasing sale, which is perhaps not surprising considering that potash for the last few years has been practically unobtainable. Moreover, it is declared to be a very economical way of supplying two important plant foods at the one dressing, neither of which is washed out of the soil by early application. The price is given as £9. 2s. 6d. per ton.

Potash.—The price of the high-grade potash salts recently acquired from Germany in exchange for food has now been raised 5s. per ton, and it is requested that all orders should be sent to the Fertiliser Manufacturers' Association. This increase raises the official maximum prices to the following figures: Potash salts, 30 per cent. potash, £12. 15s. per ton; muriate of potash, 80 per cent., £20. 17s. 6d.; and sulphate of potash, 90 per cent., £23. 7s. 6d. The 30 per cent. description appears to be the sort most available at the moment. The imports of Alsatian potash salts into the United Kingdom during the week ended November 29 were 1,541 tons sylvinitic 14 per cent., and 950 tons sylvinitic 20 per cent. Current quotations are as follows: Sylvinitic, 14 per cent. (French kainit), £7. per ton; sylvinitic, 20 per cent. (French potash salts), £8. 7s. 6d. per ton; muriate of potash, 80 per cent., £19. 7s. 6d. per ton.

Bone Meals.—So far as can be gathered from a limited market, the various descriptions of these appear to be dearer, although pure dissolved bones at about £15. 5s. are said to sell well. East Indian bone meal is still badly wanted, but not coming forward.

Slag and Super.—Whilst the output of basic slag seems to show some slight increase, deliveries are still delayed. At the same time, demand is continuous. The world-shortage of phosphates, of course, affects the superphosphate market, and very little help, apparently, can be expected yet from America. The demand is still good for 30 per cent. at £7. 15s., 33 per cent. at £8. 10s., and 35 per cent. at £9.

Other Fertilisers.—Fish guano is in good demand, and it is hoped that larger quantities are coming forward. The price of £15 to £18. per ton is quoted for material analysing from 8—9 per cent. ammonia and 2—14 per cent. phosphate. Cyanamide or nitrolim is apparently being preferred in France to nitrate of soda, although the price is said to be too high for any to ship to England. The recommendation has been published that cottonseed hulls might be useful for fertiliser material, for they could be put upon the market in an available character at from £6. to £8. per ton.

Nitrate of Lime.—This material is again on the market, but now in granular form. Sales are being affected at £19. to £20., c.i.f., British port.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

There is no abatement in the extraordinary demand for tinplates, but manufacturers are experiencing difficulties in their endeavour to materially increase the output. Some sections of the employees have handed in seven days' notice to terminate contracts, but these are described as irregular and a violation of the last clause of the Industrial Council agreement. Several works in Briton Ferry were stopped on Monday owing to a few men not turning up. During the week 156,753 boxes were shipped, and the receipts from the works totalled 66,629 boxes, leaving stocks in dock warehouses at 170,857 boxes against 132,679 boxes at the corresponding date last year.

Mr. H. Dyer Lewis, H.M. Chief Inspector of Mines, has been elected president of the South Wales Institute of Engineers.

At a joint meeting of the South Wales and Bristol branch of the Society of Chemical Industry, and the South Wales Institute of Engineers, a paper was read by Professor Illingworth, of the School of Mines, Treforest, on "Chemistry and Coal." The paper emphasised the desirability of uniform methods of coal analyses to arrive at accurate conclusions and in order to determine the best uses of typical coals. He urged that the blending of coals for fuel purposes and for coking needed profound attention, because until such time as we discovered the salient points in the chemistry of coking coals, we should not be in a position to determine the best mixtures for particular cokes. The great friability of the South Wales coals and the consequent production of large amounts of small coal necessitated constant attention being paid to the problem of their efficient utilisation. If we were to progress every colliery must have its own chemist irrespective of whether or not that colliery was engaged in by-product work.

An important meeting was held on Monday at the Swansea Metal Exchange. The gathering included metal extractors, acid makers, patent fuel manufacturers, and representatives of practically all industries in that area. Some very strong remarks were made as to the serious delays that exist on the railways, and it was stated that if something was not speedily done many works would have to close down. The complaints were of a bitter kind, and the meeting resolved to send a deputation to the Government on the matter.

SUBSTITUTE FOR BARIUM PLATINOCYANIDE.—Barium platino-cyanide, so long used for fluorescent screens in viewing objects under the X-rays, has been made very expensive by the enormous increase in the cost of platinum. After long experimenting, P. Roubertie and A. Nemirowsky have found a substitute in certain tungstates, and with cadmium tungstate claim results even superior to those with the old screen. This new material is exempt from permanent phosphorescence, is unchanged by atmospheric or X-ray action, and gives an agreeable and easy photographed white luminescence with black shadows.

PARLIAMENTARY NEWS.

Gretna Explosives Factory.

In the House of Commons, Mr. R. Young asked the Parliamentary Secretary to the Ministry of Munitions to what use, if any, the Government intend putting the large plant at Gretna; whether the valuable machinery is being or is to be sold; what is to be done with the splendidly equipped power-stations; and whether inquiries will be made for the purpose of ascertaining how it can be utilised to develop industry in the district?

Mr. Kellaway: I am not yet in a position to make a definite statement as to the future of Gretna, but I hope that as a result of inquiries now proceeding a decision will soon be reached.

Cement Manufacture and Coal Prices.

Major Prescott asked the President of the Board of Trade whether the 8s. per ton increase in the price of cement due to the 6s. advance in the price of coal will now be taken off by the cement manufacturers; and whether a still further reduction will be made corresponding to the fall in the price of coal?

Mr. Bridgeman: As the reduction in the price of coal does not extend to industrial coal, I should not expect it to have any effect upon the price of cement.

British Dyestuffs Corporation.

Major Barnes asked the President of the Board of Trade if any legal instrument exists embodying the modified terms of the agreement between the President of the Board of Trade and the British Dyestuffs Corporation.

Mr. Bridgeman: No, sir. The earlier agreement is still operative so far as it is applicable in the changed circumstances.

Patent Office Library.

Mr. Bridgeman, replying to Sir M. Conway, said: The desirability of reopening the Patent Office Library in the evening has not been lost sight of, but there have been difficulties in making the necessary arrangements owing to depletion of staff. Arrangements will be made at the earliest possible date to keep the library open every evening for several additional hours.

Oil Borings.

Mr. Kellaway, in answer to Lieut.-Colonel Clay, said: Until the oil bore-holes now in progress have reached lower horizons, it would be premature to express an opinion on the success or otherwise of the operations. The Hardstoft well is the only one which has been completed to date, and this has given an average weekly production of 1,734 gals.—a figure which, it is anticipated, will be largely increased when pumping machinery has been installed. No estimate of the cost per gallon raised can be usefully formed at this stage, but the cost of drilling has necessarily been high on account of the heavy cost of materials and freight during the war and the necessity for protecting the coal seams encountered. The question of placing the industry upon a satisfactory financial basis is one which is largely dependent upon the early passage of legislation which is contemplated dealing with oil rights.

Patents.

Mr. Doyle asked the President of the Board of Trade if he will consider the advisability of bringing in a Bill to improve and cheapen the facilities for persons of limited means to take out patents and to prevent any patentee from selling more than 50 per cent. of his interest in his invention to his employer?

Mr. Bridgeman: In reply to the first part of the question, I would direct attention to the Bill to amend the Patents and Designs Act, 1907, at present under consideration in another place. If this Bill receives the Royal Assent, it is hoped that it will improve facilities for obtaining the grant of patents. Under the present practice of the Patent Office, all possible help and assistance is given by the staff to every inventor in preparing the specifications and other documents necessary for obtaining patent rights.

Export Duties on Palm Kernels.

Mr. Dudley Ward, in reply to Lieut.-Commander Kenworthy, said: The French Government have imposed export duties on oleaginous produce shipped from French West African Colonies to all destinations, including France. It is therefore evident that these duties have not been levied

as a retaliatory measure for the duty imposed on palm kernels exported from British West African Colonies to destinations other than the British Empire. I have no information as to other similar export duties imposed by any other country.

Sir Francis Blake asked the Parliamentary Secretary to the Board of Agriculture whether he intends to introduce legislation at an early date giving to fishery boards and other bodies responsible for the protection of rivers fuller powers than they now possess for dealing with questions of pollution by trade effluents and domestic sewerage?

Sir A. Boscawen: I hope it will be possible to introduce legislation next session upon this subject.

Ministry of Munitions and the Sale of Fertilisers.

Mr. Hohler, on Monday, asked the Parliamentary Secretary to the Ministry of Munitions if he will give the names of the articles comprised under the head, Fertilisers' Account, on which the profit of £237,000. was made; and explain how they make this profit, and state what profit per ton his Department makes and exactly what his Department does to earn this profit?

Mr. Hope: The articles comprised under the head "Fertilisers" are phosphate rock, pyrites, and sulphate of ammonia. The sum of £237,000. mentioned in the question does not represent profit, but is the excess of cash receipts over cash payments for the period under review—namely, April 1, 1919, to September 30, 1919. My hon. friend will see that this is a very different thing from a realised profit on the transaction as a whole.

Mr. Hohler: What does the Government do to earn this money? That is what we want to get at.

Mr. Hope: They sell the material to the best advantage.

Mr. Holmes: Does not the answer of the hon. gentleman mean that the stock in hand has not been taken into account, and, therefore, the profit is far more than the figure shown on the paper?

Mr. Hope: If my hon. friend means that the stock has not yet been disposed of, that is true. The transaction began before the beginning of this financial year, and I do not know whether it will be concluded within the financial year.

German Dyes.

Major M'Kenzie Wood asked the President of the Board of Trade the quantity of dyes which have been consigned from Germany to this country, and whether any have yet been received; whether the values to be credited to Germany have yet been fixed; and whether the price to be paid by consumers is to be fixed on the principle laid down in the Export and Import Regulation Bill?

Sir A. Geddes: Approximately 200 tons out of a quantity of about 650 tons so far requisitioned are now on the way, but have not yet been received. The Reparation Commission has not been formally established, and consequently no final decision has been taken as to the values to be credited to Germany. The prices to be charged to consumers will be announced shortly.

Messrs. Lever Brothers' Acquisitions.

Mr. Sugden asked the President of the Board of Trade whether his attention has been drawn to the recent absorption of Messrs. Loders and Nucoline, Ltd., by Messrs. Lever Brothers, Ltd.; whether he is aware that this is a continuation of a policy which has been followed for some time by the firm in question; whether trust-like operations of this nature are threatening with extinction a large number of smaller firms who are thus finding it more and more difficult to obtain suitable supplies of materials; and whether he proposes to take any action in the matter?

Sir A. Geddes: My attention has been drawn to the statements that negotiations in the direction indicated in the first part of the question have been taking place. Investigations into a number of combinations, including one into the position in the soap industry, are being made under Section 3 of the Profiteering Act by the Standing Committee on Trusts, and I propose to await their reports before considering what further action, if any, is desired and practicable.

Basic Slag.

The Parliamentary Secretary to the Board of Agriculture (Sir Arthur Boscawen) in reply to Mr. Forestier Walker on Tuesday, said: It is quite possible to obtain basic slag of a higher percentage of total phosphates than 24 per cent. During the five months ending October 31, 1919, the total deliveries of basic slag containing upwards of 24 per cent.

total phosphates amounted to 66,200 tons. The real cause of any shortage that may exist is the greatly increased demand. The production of high-grade slag is not directly dependent on the agricultural demand, but is primarily a question of steel works practice. Over this practice the Board have no control.

Government's Loss on Spelter.

Mr. Bridgeman replying to Mr. Bird said: Under an agreement made in September, 1918, between the Ministry of Munitions and the British zinc smelters, spelter produced from zinc ore purchased with the approval of the Ministry was taken by that Department at a standard price plus increased costs of fuel and labour. This agreement was in force until November 5 last, and under it the prices paid to the producers by the Government were considerably in excess of the prices realised on sale to consumers; but I am not at present in a position to state the actual loss resulting from the arrangement, which was entered into to avoid the closing down of the smelting works.

LEGAL INTELLIGENCE.

Picric Acid Pots Dispute.

Mr. Wm. Hassall, trading as C. W. Outram, fireclay manufacturers, of Woodville, Derby, was plaintiff in an action partly heard at Derby and concluded in London on Tuesday by Mr. Pollock, High Courts Official Referee, in which he claimed against Brooke's Chemical Company, Ltd., £1,330. 4s. for the supply of pots for the manufacture of picric acid.

The plaintiff's case was that the contract to supply the pots was partly verbal and partly in writing contained in certain letters which passed between the parties during September, 1915, and the claim was made up of one account of £465. 4s., another of £756., and a sum of £9. for discount on a previous account which defendants had agreed to pay. The verbal part of the contract, it was alleged, was made between plaintiff and defendants' managing director.

The defendants did not admit the contract so far as the alleged verbal portion was concerned, and said that it was wholly contained in the letters which passed between the parties in July, 1917. They admitted that a discount of £9. had been deducted in error, but said that it was duly credited in a subsequent account and paid. They denied indebtedness so far as £565. was concerned, and claimed that they were entitled to set off against the plaintiff's claim the price of goods which were not in accordance with the contract, and were defective and unfit for the purpose for which the defendants required them. They denied having ordered 108 80gal. pots, which, at the date of their refusal to accept them, were, they said, not in a deliverable state. Generally, they alleged that the pots were not equal to sample, and that some of them cracked and broke soon after they were put into use, in consequence of which they lost a good deal of material, about 55lb. per 80gal. pot and 27½lb. per 40gal. pot of the value of 2s. 2d. per lb. They had suffered loss in this way from 70 80gal. pots to the extent of at least £417., and about £9. from the 40gal. pots. They contended that they were justified in refusing to take delivery of 108 pots, and, while denying indebtedness, paid £183. 6s. into court. They counter-claimed £474. for pots which were defective and not in accordance with contract, and £426. in respect of pots which broke when used.

The Official Referee, in giving judgment, said he was of opinion that Mr. Hassall accepted the responsibility as to the thickness of the pots, but he would not guarantee them for three months. He only undertook to supply the 80gal. pots equal to those which had been previously supplied, and the question was whether they were equal. He criticised adversely the evidence of Mr. Hassall in regard to this matter, and particularly in relation to his communications to the Ministry of Munitions. There were two questions to be decided: Firstly, whether the defendants had shown that the claim of £565. was not justified; and, secondly, the defendants said that there were so many bad pots supplied that their counter claim for loss overtopped the claim. He was satisfied that the defendants had made out their case that the goods were not in accordance with contract. The plaintiff therefore failed in his claim for £565., and the defendants succeeded in their counter claim. In the result he found for the defendant on the claim and on the counter claim for £2. 11s. 5d., with an order for payment out to them of the £183. paid into court.

Phosphates for Munitions: Action in Prize Court Against Crown.

In the Prize Court, on Tuesday, the Skanska Superphosphate and Svafvelsyre Fabriks Aktiebolaget claimed damages from the Crown, or, alternatively, the fair value of a cargo of phosphate rock on the *Consul Olsson*, in respect of which the appraised value of £16,420. was paid into court by the Crown after the Government had requisitioned the cargo. The vessel went to Swansea to discharge.

The Crown, it was stated, seized the cargo because the well-known firm of Beer, Sondheimer and Co., of Frankfurt, were found associated with the transaction; but as it was found that they had sold to the claimants f.o.b. at Tampa, in Florida, and there was no enemy interest, the goods were released as innocent; and as they had been requisitioned, the appraised value was paid into court. This, claimants said, was not enough.

Mr. Wright, K.C., for claimants, said the rate of appraisal was 88s. per ton, and the amount of moisture had been deducted twice over. He suggested the minimum should be five guineas a ton, and that sum, in point of fact, was at the time offered on behalf of the Ministry of Munitions. The claimants were enormous buyers of phosphates, and as the goods had been used by the Crown, and it was admitted they were not contraband or destined to Germany, it followed that they were entitled to something. Of the £16,000. paid into court, part had gone to the claimants and part to the shipowners, and the shipowners were represented in court and entered a claim. The phosphate was seized at the end of October, 1915, and distributed to certain munition factories. The Ministry of Munitions was charged with the settlement of the claims, and it was then that the offer of five guineas was made—a direct offer to pay, fixing a minimum, which, counsel submitted, was equivalent to payment into court. As to market value, the Ministry of Munitions during the war wanted this stuff, and if it had not been for this and another cargo that demand would entirely have changed the position as to price and value. This fact had to be borne in mind in approaching the question of values here.

Mr. Robert A. Munro, of the firm of Robert A. Munro and Co., phosphate merchants, of Glasgow, said that phosphate came from two places, America and the Mediterranean, and the Mediterranean phosphate was not so well suited to the requirements of the munitions people. It was of a lower grade, with a lower unit of phosphate content. It was more expensive to handle. At the end of 1915 the price of the goods at shipping ports would be 3½ dollars per ton of 68 per cent. quality, and on top of that the freight would probably be 5 guineas a ton. The price could be put at £6. a ton.

The hearing was adjourned.

Caustic Soda Contract Dispute.

A claim for damages for the alleged breach of a contract to accept and pay for 300 tons of caustic soda was heard by Mr. Justice Roche in the Commercial Court of the King's Bench Division on Thursday (November 27). The action was brought by The Produce Brokers' Company, Ltd., of Exchange Chambers, St. Mary Axe, London, against Widenmann Broicher and Co., Ltd., of London House, Crutched Friars; P. D. Leake, of Abchurch Lane; and Cowan Bros., Ltd., of London House, all of London.

Plaintiffs' case, opened by Mr. G. Herbert Head, was that by a contract note dated May 2, 1918, made between them and the first-named defendants (Widenmann's), plaintiffs agreed to sell 300 tons, 5 per cent. more or less, caustic soda at £46. per ton, delivery to be taken by buyers *ex* warehouse or cars New York not later than September 30, 1918, payment net cash in New York against delivery order. The claim was for £8,647. damages for failing to accept and pay for the caustic soda. By an order of the Board of Trade of August 9, 1918, made under the Trading with the Enemy Acts, the second-named defendant (Leake) was appointed controller with power to sell the business carried on in the United Kingdom by Widenmann's, and the controller sold the business to the third-named defendants (Cowan's), one of the terms of the sale being that Cowan's should take over and satisfy the liabilities of Widenmann's. Plaintiffs wrote to Leake and Cowan's calling on them both to open credit in New York where delivery of the goods was to be taken. There was no credit opened, and the result was plaintiffs had to sell against defendants. There had been a previous contract with Widenmann, Broicher and Co. in September, 1917, and the

defence set up was a claim for rectification of the 1918 contract on the ground that defendants entered into it on the understanding that it was identical with the 1917 contract, except for an extension of time. The real difficulty in the case had arisen in this way:—When the 1917 contract was made there was an embargo in the United States against the export of caustic soda. There was a great deal of correspondence, but throughout the negotiations under that contract it was never suggested that it was the duty of the plaintiffs to obtain the export licence. After a time there was a suggestion of arbitration. Arbitration fell through. Then the 1918 contract was entered into. It was perfectly clear, said counsel, through the whole of the interval between the first and the second contracts, Widenmann, Broicher and Co. regarded it as their duty to get the export licence. Now they turned round and claimed rectification of the 1918 contract.

Mr. Raeburn, K.C., on behalf of Cowan Bros., Ltd., said he had advised his clients that rectification was out of the question. There was no defence to the claim under the second contract. Therefore that meant judgment for the plaintiffs against somebody.

Mr. Ricketts, for the defendants Widenmann, Broicher and Co., and P. D. Leake, submitted that he was entitled to an indemnity from his learned friend's clients.

After arguments by counsel, his lordship gave judgment against Widenmann, Broicher and Co. with costs; judgment for the defendant Leake, with costs; and judgment for Cowan Bros., Ltd., without costs.

Customs Seizure of Pyrogallol Acid.

In the King's Bench Division on Thursday (November 27), before Mr. Justice Sankey, the hearing was resumed of the action brought by the Crown, through the Attorney-General, against John Brown, trading as Brown and Forth, of Manchester and London. The case related to restrictions on imports by the prohibition of the import of pyrogallol acid, and was reported fully in our last issue.

Mr. Wright, K.C., on behalf of the respondent, said he could not contend that there would be any limitation under the Proclamation if the legislature had vested in the executive a universal power to prohibit goods of any kind whatever. If that was the case it must be expressed in clear terms. The Proclamation did not contain an absolute and general prohibition. It must be treated as a whole. If it was a general prohibition it was good, but if it merely amounted to this, that the Government could stop the importation of any goods they liked it was bad.

His Lordship: Bad in part makes the whole thing bad?

Mr. Wright said that was so, and submitted that they could not cut off the first part of the Proclamation from the proviso in the Act that the prohibition did not apply to goods imported under licence.

His lordship reserved judgment.

A Bankrupt's Discharge.

At the London Bankruptcy Court on Friday of last week an application was made for the discharge of Richard Maloney, of 11, Aberdeen Park, Highbury, and lately residing at 15, Lambolde Road, Hampstead.

The Official Receiver reported that the Receiving Order was made on July 2 last on the petition of a creditor. The liabilities expected to rank against the estate for dividend were estimated at £5,293., and the assets had realised £2. 10s. In March, 1917, the debtor became interested in a certain secret process for the manufacture of glaze and enamel, and in June, 1917, he agreed to purchase for £4,000. a two-fifths interest in the invention. The purchase consideration was satisfied as to £3,000. in cash and the balance in fully paid shares in a company which it was proposed to form, to acquire one of the processes with a nominal capital of £100,000., of which he was to have received £40,000. Of the £3,000. he actually paid £2,350., mainly with money advanced for that purpose, but no company was floated, and since July last he had been in employment.

The learned registrar granted the debtor an immediate discharge subject to his consenting to judgment for £5.

The Price of Benzole.

At the Complaints Tribunal of the Central Committee under the Profiteering Act, sitting at the Hotel Windsor, London, the Woodcock Motor Company, of Epsom, brought

a complaint against Messrs. S. Bowley and Son, Ltd., of Battersea, the allegation being that 2s. 6d. a gallon was charged for benzole, while other companies delivered at 2s. 4d. Counsel for the respondents stated that they bought the spirit at 2s. 1½d. per gallon, and consequently made a profit of 4½d. per gallon. In the case of an ordinary delivery, where benzole was only one of the commodities carried, a profit was made. In this actual case a special delivery was rendered necessary, involving the use of a five-ton lorry. The firm estimated that they had incurred a loss on the transaction of between 30s. and £2. It was stated by the manager of the firm that there was no actual "ring" in the trade, but there was an inclination on the part of big combines to hold a monopoly of the supply. One firm's contract compelled sale at 2s. 8d. a gallon.

The Chairman said there was, in the opinion of the tribunal, no case of profiteering. At the same time they were inclined to think, from the evidence given, that an attempt was being made to create a "corner" in the market, and they proposed to bring that fact before the Development Committee sitting for combines and trusts.

Co-partnership Dispute.

The disputes which the co-partnership scheme of Messrs. Lever Brothers has caused among trade unionists were mentioned to Mr. Justice Peterson in the Chancery Division on Friday of last week, when the plaintiffs in Braithwaite and Others v. the Amalgamated Society of Carpenters, Cabinet Makers, and Joiners moved to restrain the defendants from expelling or excluding them from the society on the ground that they were participating in the co-partnership scheme.

Mr. Cunliffe, K.C., for the plaintiffs, said the motion would have to stand over for further evidence, but he wanted an undertaking to protect his clients meanwhile. If the purported expulsions were acted upon it would be extremely serious for the plaintiffs. It would not only jeopardise their position in the society, but would also jeopardise their position with Messrs. Lever Brothers. Therefore he wanted the defendants to direct their branches to take no steps.

Mr. Wright, for the defendants, said all he could do was to undertake to preserve the *status quo*, and he understood that that undertaking had been accepted by the plaintiffs' solicitors.

Mr. Cunliffe said he feared that such an undertaking would be no protection for his clients.

In the end the motion stood over until after Christmas on the defendants' admission that none of the plaintiffs had been expelled and on their undertaking to preserve the *status quo*.

Seizure of Gas Mantles.

Judgment has been given at the Thames Police Court, London, in favour of Mr. Bendeker, a Dutch manufacturer, of Arnhem (Holland), in a case which has been pending since 1915.

The Customs authorities seized some 60,000 incandescent gas mantles, on the ground that they contained more than 25 per cent. of German material. The magistrates decided that Mr. Bendeker had proved the construction of the mantles from old mantles and United States cotton, and awarded 25 guineas costs against the Customs authorities.

Goonvean China Clay Company.

In the Chancery Division on Friday of last week Mr. Justice Astbury heard a motion in the case of Varcoe v. Varcoe for an injunction restraining five members of a partnership called the Goonvean China Clay and Stone Company from disposing of the property of the partnership to the Goonvean China Clay and Stone Company, Ltd.

Mr. Romer, K.C., who appeared for the plaintiffs, who were four other members of the partnership, said that the five defendants were a committee of management, and they had recently caused the purchasing company to be incorporated. A sixth defendant represented those members of the partnership who assented to a resolution under which the committee purported to sell or proposed to sell the assets of the partnership.

Mr. Micklem, K.C., for the defendants, said it was thought that it would be a great advantage to the co-adventurers in this company to turn their adventure into a limited company, and at the meeting that was held there was a large majority in favour of it. However, this action in court had defeated

the plan. He would give an undertaking in the terms of the notice of motion, and further, that they would not register any transfers in the books of the company.

The undertaking was accepted and the motion stood over until the trial.

Plytol Chemical Company, Ltd.

In the Chancery Division on Friday (November 28), Mr Justice Astbury made an order confirming a special resolution of the Plytol Chemical Company, Ltd., altering their memorandum of association so that they might carry out the business of manufacturing disinfectants, sheep dips, chemicals, and oils, in addition to selling and dealing in them.

Sulphide of Sodium Contract.

On Wednesday, Mr. Justice Bailhache had before him the question of an arbitration in the case of the British and French Chemical Manufacturing Company, Ltd., against Ofverborg and Company. The defendants were represented by Mr. W. Allen and the plaintiffs were not represented by counsel.

This was a special case stated by arbitrators, said counsel in opening, raising questions in regard to a contract for the sale of 20 tons of sulphide of sodium made in June, 1917. In May, 1918, the British and French Chemical Manufacturing Company had not delivered the goods under the contract, and the matter went to arbitration with the result that the delivery of the whole of the 20 tons was to be made in October, November and December, 1918. The company did not carry out the award and the goods were not delivered. The matter again went to arbitration, and the arbitrators in their award found that there had been a breach of contract on the part of the sellers by reason of their failure to make any of the deliveries under the first award. The sellers asked for a special case to be stated for the opinion of the Court as to whether upon the true construction the first award constituted a valid and binding contract for the sale of goods. The buyers' contention was that any such question should have been raised when the first award was made. The arbitrators in the second arbitration said if the Court held that the first award was a valid and binding contract then the sellers should pay the buyers £450 damages. Counsel now argued that the first award was a valid and binding contract by which the sellers were bound, and that as they had not chosen to attack it at the time it was enforceable and the buyers were entitled to the goods delivered and the dates fixed in the award.

His Lordship remarked that if the award was bad on the face of it the sellers were not bound to take any notice of it. If the sellers were completely in default in not delivering any goods now, could they be ordered to deliver the goods at a subsequent date? It was really a case of a claim for damages for breach of contract. The contract was ended and there had been a complete breach. What power had the arbitrators to fix dates of deliveries when there were no such dates in the contract? He was asked whether on the true construction of the first award it was a valid and binding contract for the sale of goods by the chemical manufacturing company, and the answer to that was obviously "No." It was not a contract at all.

Mr. Allan argued that after all it was an award that finally determined the rights of the parties.

His Lordship: It may be a good or a bad award, but it certainly is not part of the contract.

Mr. Allan asked that the case might go back to the arbitrators.

His Lordship: No. If people will go to arbitration they must put up with the disadvantages of it. I answer the questions put by the arbitrators in the negative. The award is not a valid and binding contract.

SWEDEN AND RAMSAY MEMORIAL FUND.—*Reuter's* Stockholm correspondent states that with reference to the British Ramsay Memorial Committee's application to Sweden to pay £60,000, on condition that a Swedish chemist should every year be granted a Fellowship with the object of studying and making researches at the institution in England, the famous chemist, Professor Arrhenius, strongly advocates that the Government should ask the Riksdag to grant the necessary funds, on the ground that the Swedish holder of the Fellowship would undoubtedly get the most ample opportunity of learning the best and latest scientific results obtained in England and her large dominions and colonies.

REPORTS OF COMPANIES.

Castner-Kellner Alkali Company, Ltd.

The twenty-fourth ordinary general meeting was held in London on Wednesday, the Right Hon. G. W. Balfour presiding. The chairman, in moving the adoption of the report and accounts, said that the net profit for the year amounted to £190,655., and the balance available to be dealt with that day was £17,876. The board recommended the appropriation of £50,000. to depreciation reserve, increasing that to £637,500., the sum of £70,000. to the payment of a final dividend of 7 per cent., making 13 per cent. for the year, and that the balance of £51,876. should be carried forward. The figures were disappointing. For a series of years, both during the war and before it, they had been accustomed to a dividend of 20 per cent.; no dividend as low as 13 per cent. for the year had been declared since 1908. Whilst sharing the regret the shareholders must naturally feel at this setback, he hastened to add that, in his opinion, it was not likely to be of more than a temporary nature. The falling off was first of all due to the general uncertainty in business, which had led to a diminished demand for their products, with an equivalent reduction in output, which had the double effect of diminishing sales and greatly increasing the cost of production. They had also been faced since the beginning of the year by further demands for increased wages, and the cost of raw materials had risen enormously—the cost of fuel in particular. The sale price of their products had also risen, but, during the year under review, not in proportion to the rise in the cost of production. A return of trade to normal conditions would remedy many, if not all, of the disadvantages from which the company had been suffering, and he was glad to say that signs of such a return were already visible on the horizon.

Mr. John S. Parkin seconded the motion and it was carried unanimously.

Liverpool Nitrate Company, Ltd.

The report for the year to June 30 last states that, pursuant to the resolution for amalgamation with the Colorado Nitrate Company, Ltd., passed at an extraordinary general meeting held on November 28, 1918, the called-up capital of this company now stands at £64,800., divided into 259,200 shares of 5s. each fully paid. The assets and liabilities of the Colorado Nitrate Company, Ltd., are incorporated in the present balance-sheet. The premium paid upon the shares issued in exchange has been carried to a special account. The profit for the year was £84,355., and £12,432. was brought in, making £96,787. The directors recommend a further dividend of 5s. per share, free of tax, payable on December 5, making, with the interim dividend paid last May, a total of 7s. per share, free of tax, for the year. As a member of the Association of Nitrate Producers, which came into force at the end of November, 1918, the company is limited in ratio to the sales effected by the Association. By the addition of the allotment of the quota which the Colorado Nitrate Company would have received, it has been possible to concentrate manufacture and keep oficinas Ramirez and Mapocho running. Consequently, oficinas San Donato and Carmen Bajo were closed down in January and March last, and advantage was taken of the stoppage to overhaul the machinery.

Bryant and May, Ltd.

An extraordinary general meeting will be held on December 10 for the purpose of considering a resolution to the effect that the capital of the company be increased from £1,480,000. to £2,000,000. by the creation of 520,000 new shares of £1. each, of which 320,000 shares shall be ordinary shares and the remaining 200,000 shares shall be partnership shares. It is also proposed to make various alterations in the articles of association, so that the scheme of co-operative profit sharing with the workers, referred to in the last annual report, may be carried into effect.

Huelva Copper and Sulphur Mines, Ltd.

After providing £1,173. against repairs to buildings, and writing £8,413. off development, the accounts for the year to June 30, 1919, show a loss of £4,227., from which must be deducted the credit balance of £1,746. brought in, leaving a debit balance of £2,481. to be carried forward. Last year, after providing £2,112. against repairs to buildings, £5,000. against depreciation of plant and machinery, £9,016. expended on mines and development, writing £6,500. off

minerals in cementation and £5,322. off development, and including the £8,978. brought in, a credit balance of £1,746. was carried forward.

Cassel Cyanide Company, Ltd.

The accounts for the year to September 30 show a net profit of £69,866. and £18,881. was brought in, making £88,747. Further dividend of 1s. 6d. per share, making 2s. per share for the year; carrying forward, £18,247.

Loders and Nucoline, Ltd.

The directors report for year ended August 31 last that after providing for bad and doubtful debts, depreciation and sinking fund instalments, there remains £70,376., which with £11,984. brought in makes £82,360. The board recommend final dividend of 12½ per cent. on ordinary, making 20 per cent. for year.

Lagunas Syndicate, Ltd.

Accounts for the 12 months to June 30 show gross profit of £41,480., from which has been deducted London expenses, income tax, interest, and discount, £8,126.; debenture interest, £15,702., leaving £17,652., which has been transferred to the sinking fund in accordance with the resolution of debenture-holders of December 14, 1914. It has been decided to install oil fuel, and a plant for South Lagunas has been ordered.

Alby United Carbide Factories and Nitrogen Products and Carbide Company.

The extraordinary general meetings of shareholders of the Alby United Carbide Factories, Ltd., and the Nitrogen Products and Carbide Company, Ltd., were held in London on November 27, when the necessary resolutions regarding the amalgamation were confirmed.

Courtaulds, Ltd.

The directors have decided to recommend to the shareholders the issue of one bonus share for each share held, based upon the capitalisation of the company's general reserves. The board are of opinion that the company's capital reserve investment in shares in the Viscose Company continues to appreciate in value; but they do not recommend that any action be taken at present in the way of the capitalisation of this reserve.

Anglo-Persian Oil Company, Ltd.

The profit for the year to March 31, after allowing for depreciation, etc., amounts to £2,010,805., and £154,722. was brought in, making £2,465,527. Deduct £1,200,000. reserved for excess profits duty and the following appropriations: Debenture stock redemption reserve, £80,000.; preference share reserve, £50,000.; general reserve, £300,000.; and amortisation reserve, £100,000.; leaving £735,527. The directors recommend a dividend at the rate of 10 per cent., free of tax, on the ordinary shares, leaving £275,527. to be carried forward. In view of the largely extended operations of the company, it has been decided to increase the capital of the company to £20,000,000.

Bleachers' Association, Ltd.

The directors declare a dividend at the rate of 8 per cent. for the half-year, or 4 per cent. actual, against 2½ per cent. actual a year ago. The gross profits were £782,457. and the net profits £549,940., and £546,831. is carried forward to next half-year.

Malayan Tin Dredging Company, Ltd.

The report for the year ended June 30 states that the profit for the year, after allowing for depreciation, was £40,497. After payment of dividends as declared, there is an available balance of £47,868. A final dividend of 1s. per share is declared, making 5s. per share, or 25 per cent., for the year; and the balance, out of which has to be provided the liability for excess profits duty, is carried forward. The total quantity of tin ore produced was 702½ tons, which realised £109,957., or an average price of £156. 10s. per ton, as compared with £161. 6s. 2d. for the previous year.

DIVIDENDS.

BROXBURN OIL COMPANY, LTD. A dividend of 7½ per cent. actual, free of tax, on the ordinary shares.

BRITISH CYANIDES COMPANY, LTD.—Interim dividend at 10 per cent. per annum (1s. per share), free of tax, on ordinary for half-year.

UNITED PREMIER OIL AND CAKE COMPANY, LTD.—Directors have decided to pay on account of profits for first financial period ending December 31, 1919, interim dividend of 5 per cent., free of tax, on ordinary.

SULPHIDE CORPORATION, LTD.—Final dividend of 7½ per cent. on the ordinary shares, making 15 per cent. on both classes of shares for the year ended June 30.

NEWS FROM THE ANTIPODES.

(FROM OUR OWN CORRESPONDENT.)

SYDNEY, October 6.

Alsation Potash for Australia.—The Commonwealth Government steamer *Australpeak* left Amsterdam on August 23 for Adelaide, Melbourne, and Sydney, via Genoa and Messina. At Rotterdam the *Australpeak* loaded the following quantities of Alsation potash: For Adelaide, 441 tons; for Melbourne, 500 tons; for Sydney, 2,022 tons. Prior to the war Australia imported about 10,000 tons of potash annually from Germany.

Kauri Oil Works in New Zealand.—The kauri oil works, erected for the Parenga Gumfields, Ltd., at a cost of £10,000., have been completed and the machinery has been given a satisfactory trial. The capacity of the plant is 4,500 gals. weekly, and it is anticipated that a ton of peat will yield 75 gals. of oil. Subsequent to the engineer's inspection, the works will officially be opened.

New Zealand Sulphur.—It has never yet been satisfactorily settled whether or not there exist in New Zealand workable sulphur deposits of sufficient magnitude to warrant their exploitation, says the report of the Parliamentary Industries Committee. As pointed out by more than one witness, it is incumbent upon the Government to put the matter to the test, and the committee recommends accordingly.

Australian Chemical Institute.—The annual election of the committee of the Victorian branch resulted in the return of Professor Masson as president, Mr. B. T. Paton as hon. treasurer, Dr. F. H. Campbell as hon. secretary, and Messrs. V. G. Anderson, C. S. Dawes, W. F. Cuming, and R. J. Lewis as members of committee. The annual report shows that the membership of the Victorian branch is 212, and that that of the institute as a whole approaches 600.

Calcium Carbide Manufacture in New Zealand.—One of the recommendations of the Parliamentary Industries Committee is that an effort should be made as early as possible to give practical effect to a proposal made for the manufacture of calcium carbide. On a comparatively small capital outlay, the whole of the needs of the Dominion of New Zealand could be met and a considerable quantity be available for export.

Chemical Market.—Chemicals have been generally firm, but business has been only of moderate dimensions. Average distributing quotations were as follows:—Alum: Japanese £30., English £32. per ton. Arsenic: White £65., grey £60. per ton. Bluestone: Macclesfield's £55., Japanese £40., U.S.A. £50. per ton. Boracic acid, £96. per ton. Borax: Powdered or lump, £55. per ton. Carbide: Tasmanian £36. per ton, Alby 75s. per drum of about 2 cwt., Japanese 32s. per 100 lb. drum, Canadian 45s. per cwt. Carbolic acid: English, 98 per cent., 9s.; colonial, 8s. 6d. per gallon. Citric acid: 4s. 3d. per lb. Tartaric acid: 8s. 11d. net per lb. Cream of tartar: 95 per cent., 3s. 1½d.; 99 per cent., 3s. 1½d. per lb. Cyanide: 98 per cent., 1s. 4d. per lb. Quicksilver, 7s. 3d. per lb. Resin: G grade, £52. 10s.; N grade, £55. per ton. Soda: Silicate, liquid, £22.; bicarbonate, in kegs, English, £16.; soda ash, £15.; soda crystals, £9. 10s.; caustic soda, English, 76 per cent., £26.; American, 76 per cent., £23.; 98 per cent., £50. per ton. Phosphorus, 5s. 6d. per lb. Sulphur: American flowers, £36.; Japanese common, £18. per ton. Oxalic acid, 2s. 6d. per lb. Chloride of calcium, £20. per ton. Whiting, English £16., Danish £14. per ton.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

November 24th to 29th (inclusive).

Treatment and Reduction of Sulphide Refractory, etc., Ores. Angel, H. R. 29,213.
 Ferro-chrome Alloys. Ballantine, W. B. 29,216.
 Carbonisation of Coal. Beilby, G. T. 29,817.
 Neutralisation of Fatty Acids in Fats and Oils. Bolton, E. R.; and Lush, E. J. 29,705.
 Vulcanisation of Rubber, etc. Brierley, J. T.; Leyland and Birmingham Rubber Company; and Lunn, R. W. 29,381.
 Blending Oils and Fats. Calvert, G. 29,533.
 Coke Ovens, etc. Coke and Gas Ovens, Ltd.; and Cooke, A. H. J. 29,767.
 Mixing and Agitating Machines and Appliances. Coleman, G. F. 29,238.
 Obtaining Hard Springy Copper by Electro-deposition. Coles, S. O. Cowper-. 29,847.
 Gas Calorimeters. Davidson, W. B. 29,631.
 Dyes. Davies, L. J. 29,358.
 Treatment of Fine Ores. Dorr Co. 29,302.
 Recovering and Utilising Solvent from the Air which Passes Away from Apparatus for Extracting Oil, Fat, etc. Downs, C.; and Melton, J. W. 29,781.
 Recovery of Zinc by Electrolysis. Electrolytic Zinc Co. 29,504.
 Conversion of Hydrocarbons. Fleming, R. 29,490.
 Condensing and Treating Distillates. Fleming, R. 29,491.
 Producing Oxygen and Ammonium Carbonate. Foster, J. 29,775.
 Deacidification of Raw Wood-pulp Liquor. Grätz, B. 29,474.
 Flux for Welding. Groves, W. E. 29,844.
 Condensing Apparatus. Hick, Hargreaves, and Co., H. 29,460.
 Sulphuretted Hydrogen, etc., Generating Apparatus. Keenan, H. W.; and Richardson, S. 29,399.
 Zinc Oxide. New Jersey Zinc Co. 29,293.
 Metal Oxides and Other Compounds of Metals. New Jersey Zinc Co. 29,297, 29,303, and 29,539.
 Sulphide Composition for Painting which Resists Action of Light and Heat. Nishizawa, Y. 29,417.
 Distillation of Coal, Shale, Peat, Wood, etc. Oddy, T. 29,347.
 Purifying or Refining Hydrocarbons. Oddy, T. 29,348.
 Light Hydrocarbons, etc., for Motor and Lighting Purposes. Oddy, T. 29,349.
 Obtaining Vulcanised Rubber Goods and Materials. Peachey, S. J.; and Skipsey, A. 29,172.
 Concentration of Sea-water. Reid, T. A. 29,754.
 Combined Disinfectants and Perfumes in Solidified Form. Sandy, M. E. 29,450.
 Granulating Calcareous Cyanamide to Enable it to be Employed as Ammonia-potassic Fertiliser. Savès, P. 29,378.
 Nitrocellulose or Celluloid Compounds. Stevenson, W. J. 29,295.
 Pure Potash Salts. Wilderman, M. 29,625.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25 Southampton Buildings, Chancery Lane, W.C.

The numbers in heavy type are those under which the Specifications will be printed and abridged and all subsequent proceedings will be taken.

1917.
 Oxidation of Ammonia. Adams, H. E. F. Gould; Partington, J. R.; and Rideal, E. K. 9,653. **135,224**
 1918.
 Continuous Fractional Distillation of Petrols, Petroleum, Benzole, and the Like. Barbet et Fils et Cie, E. 10,341. **117,615**
 Edible Product Obtained from Beet. Kestner, P. 14,969. **135,235**
 Removing the Tar from Tar-containing Liquids. Barbet et Fils et Cie, E. 16,457. **120,558**
 Current-regulating Devices for Electrically Heated Crucibles, Retorts, Muffles, Melting Furnaces, and the Like. Morgan Crucible Co.; and Speirs, C. W. 16,673. **135,237**
 Treatment of Vegetable Fibrous Materials and the Production of Detergents. Amber Size and Chemical Co.; and Weygang, G. 16,825. **135,240**
 Potassium Chloride. Dutt, E. E.; and Dutt, P. C. 17,083. **135,246**
 Crucible Furnaces for Melting Aluminium and the Like for Casting Purposes. Price, C. F. 17,151. **135,247**
 Barium Oxide. Pierce, J. B. 18,993. **135,285**
 Deodorising and Purifying Oils and Fats. Calvert, G. 19,126. **135,295**
 Treating Pyrolusite. Jorgensen, C. V. 19,266. **135,305**
 Grinding, Crushing, and Pulverising Mills. Wake, J. F. 19,770. **135,322**
 1919.
 Sulphuric Acid. Dawson, H. Royal-. 265. **135,359**
 Paints. Goldthorpe, E. T. 1,462. **135,368**
 Distant Liquid Level Indicators. Badin, R. E. 3,682. **123,729**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1919.
 Manufacture of Catalysts. Brochet, A. 29,002. **135,510**
 Porous Charges for Containers for the Storage of Explosive Gases Dissolved in Liquids. Pintsch Akt.-Ges., J. 29,003. **135,511**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Extraction of Fats and Fatty Oils. F. B. Dehn, Westminster. (A communication from the Cobwell Corporation, Cleveland, Ohio, U.S.A.) British Patent, 133,075, of 1917.

In the extraction of fats and oils from moist materials such as garbage, offals, fish, meat, and vegetable substances, including seeds and beans, the material is treated with a solvent insoluble in water at such a temperature that the water and solvent are boiled off together, the quantity of solvent in the extraction chamber being kept constant by suitable additions. After the evaporation of the water is complete, the solution of fat is drawn off and the material is treated with a further quantity of solvent. The solvent used at this stage has a boiling-point below 100° C. The apparatus, Fig. 1, consists of a shallow extraction chamber 1 fitted with a heating-jacket 2 and communicating by a vapour pipe 23 with a condenser 15. From the condenser,

the condensate flows through a water separator 19 to one or other of two storage tanks 17, 18, according to the type of solvent used. The quantity of solvent in the extraction chamber 1 is kept constant by returning solvent to the chamber by means of a pump 31 in the pipe-line 26. At the close of each stage, the solution of fat is drawn off through a mud-separator 42 and is forced by a pump 13 into a still, which communicates by a vapour pipe 24 with the condenser 15. The extraction chamber, Fig. 2, contains a thin layer of material submerged in solvent, and an undulatory movement is imparted to the material by rotating, curved, and inclined blades 7 which move over the bottom of the chamber. Co-operating with the stirrer 7 are a number of freely-swinging arms 10 which stir the upper surface of the material. To

prevent the formation of deposits on the bottom of the chamber 1, a scouring material, such as broken bones, is placed in the chamber. To recover residual solvent, the material in the chamber 1 is raised to above 100° C. by the heating-jacket 2, and steam, admitted by open steam-pipes 41 arranged below the foraminous bottom 40 of the chamber 1, is passed through the material.

Explosives. W. Rintoul, T. J. Nolan, and Nobel's Explosives Company, Ardeer Factory, Stevenston, Ayrshire. British Patent, 131,389, of 1918.

This invention consists in the use in nitrocellulose explosives of urethanes containing, attached to the nitrogen atom, two aromatic groups, one of which is a benzyl or substituted benzyl group, such as phenylbenzylurethane, or benzyltolylurethane.

These urethanes have a gelatinising action on nitrocellulose. Other gelatinising agents and stabilising agents may be added. One example contains nitrocellulose 50 per cent., nitroglycerine 41 per cent., benzylparatolylurethane 8.5 per cent. or phenylbenzylurethane 8 per cent., and ethylbetanaphthyl ether 0.5 per cent. or diphenylurethane 1 per cent. These urethanes are prepared by adding ethylchloroformate to secondary amines suspended or dissolved in an aqueous or alcoholic solution of sodium carbonate. They may also be prepared like other urethanes; for example, phenylbenzylurethane may be prepared by the action of sodium ethylate on phenylbenzylureachloride, or of benzylchloride on the sodium derivative of phenylurethane.

Hydrocarbon Oils. G. F. Forwood, and J. G. Taplay, London. British Patent, 133,059, of 1916.

Hydrocarbon oils are hydrogenated, cracked, or treated for the removal of sulphur by bringing their vapours mixed with steam at temperatures between 450° and 600° C. into contact with a form of carbon that is capable of decomposing steam with the production of nascent hydrogen at those temperatures. The forms of carbon used include lamp-black, soot, charcoals derived from wood, cellulose, and lignite, and carbons obtained by carbonising oil residues and other organic bodies at temperatures below 600° C. The process is applied to the treatment of coal oil, shale oil, petroleum, and lignite oil. In examples, kerosene is cracked at 570° C., cracked spirit is hydrogenated at 500° C., and shale spirit is desulphurised at 530° C. The products are led to a condenser and thence to a scrubber, where they are washed with creosote oil. After desulphurisation, the products are washed with dilute caustic soda to remove sulphuretted hydrogen.

Carbides. J. H. Reid, Pittsburgh, Pennsylvania, U.S.A. British Patent, 133,098, of 1918.

Hot gases from the reaction zone of an electric carbide furnace, in which the charge is heated by its resistance, are passed through a raw mixture of carbonaceous material and metal oxide, to prepare the mixture for conversion. This preheating may take place in the furnace itself. Bituminous coal mixed with lime or barium oxide may be fed into the upper part of the electric furnace through a charging-door 21. Intimate mixing of the materials takes place in an intermediate layer 41 in which the evolved gases agitate the

plastic charge. The electrodes 10, 11 are maintained out of contact with the fused product 43. In starting the furnace, about 5 per cent. of powdered coke may be added to the mixture to increase its conductivity. The furnace is pivoted to a carriage 7 running on rails. A domed cover is held by external clamps 22. In the cover is a gas-outlet pipe 18 with damper 20. A sweating section 25 of the outlet pipe may dip into a fusible seal 19. The gases may be led to a condenser and reservoir.

Cyanogen Compounds. F. L. Slocum, Pittsburgh, Pennsylvania, U.S.A. British Patent, 133,105, of 1918.

The production of cyanogen compounds from nitrogen and a carbide, which as calcium carbide, with or without a catalyst, and the production of ammonia from the product, is effected in one apparatus by a continuous series of operations. The apparatus described comprises a series of furnace chambers 2, each having end doors 3 and a top 4, with an outlet 5 for the gases passing through a trap 6. Extending from one end of the heating-chamber is a platform 9 for the charging-rack. The rack consists of a frame 10 comprising uprights 11, side pieces 12, and cross-pieces 13. The rack is provided with rollers 16 and carries perforated trays,

which may be provided with a lining of wire mesh. The rack is moved into and out of the heating-chamber by means such as a ram. To carry out the process, the heating-chamber containing the carbide is filled with nitrogen under slight pressure and heated to 1000° C. When the reaction is effected, the product is allowed to cool in the chamber to about 450° C., and steam is passed in to produce ammonia, which is collected. The rack is then removed and the trays re-charged or the temperature of the furnace chamber is raised to 850° C. to expel water and carbonic acid from the residue.

Acetaldehyde. H. W. Matheson, Shawinigan Falls, Quebec, Canada. British Patent, 132,557, of 1918.

Acetaldehyde is prepared by passing acetylene in large excess through a sulphuric acid solution of approximately 6 per cent. strength containing mercuric oxide at a temperature of 40-65° C. and a pressure ranging from atmospheric to 4 lb. per sq. in. above atmospheric. The requisite amounts of water, acid, and mercuric oxide to keep the reaction liquid uniform are added periodically. The process is carried out in iron-silicon vessels as described in Specification 115,899. The mercury sludge formed in the process may be regenerated by the processes described in Specifications 132,559 and 132,560.

Forming Nitrates by Bacterial Oxidation. C. I. Thorssell and H. L. R. Lunden, Gothenburg, Sweden. British Patent, 132,882, of 1918.

The bacterial oxidation of ammonia, ammonium compounds, or organic nitrogen compounds to form nitrates is effected in a vessel 1 in which is supported, on a perforated grating or on a disc of charcoal or firebrick 3, a substance which will act as a base, such as calcium carbonate or hydrate or magnesia. A solution of nitrate from a preceding operation, and therefore containing bacteria, is poured into the vessel, the solution to be oxidised is added, and air is blown in below the support 3 and rises in a divided form through the liquid. When the oxidation is complete, part of the liquid is drawn off, and a further quantity of solution to be oxidised is added. A filtering-layer of coke, gravel, sand, charcoal powder, or powdered firebrick may be placed below the support 3 or may take the place of the support.

Fuming Sulphuric Acid. British Dyes, Ltd., J. Turner, and W. B. Davidson, Huddersfield. British Patent, 132,923, of 1918.

Fuming sulphuric acid of high strength (40–80 per cent. SO_3) is produced by a continuous process in which fuming sulphuric acid of low strength (20–40 per cent. SO_3) resulting from the contact process is heated to dissociation point by the hot gases from the contact plant, the sulphur trioxide evolved being absorbed in more fuming sulphuric acid of low strength, and the stripped acid returned to the absorbers of the contact plant.

Recovering Mercury in Acetaldehyde Manufacture. H. W. Matheson, Shawinigan Falls, Quebec, Canada. British Patent, 132,559, of 1918.

The mercury sludge resulting in the manufacture of acetaldehyde is allowed to stand, the separated liquid is drawn off, and the solid portion is neutralised with alkali and then heated to 100–125° C.; this partly decomposes mercury compounds, and the liquid mercury is run off. The residue is dry-ground in a ball-mill to remove more mercury, and the material is then heated to 100–500° C. to carbonise it; the liberated mercury is then separated by flotation from the carbon particles.

Dyes. G. B. Ellis, London. (A communication from Chemical Works, formerly Sandoz, Basle, Switzerland.) British Patent, 132,995, of 1919.

Disazo dyes are obtained by coupling tetrazotised 4 : 4'-diaminodiphenyl-2 : 2'-dicarboxylic acid with *o*-oxycarboxylic acids of the benzene series; salicylic acid, 4-oxisophthalic acid, *o*-cresotinic acid, and *m*-cresotinic acid, are specified as components. The products give yellow shades when printed on cotton with chromium or chromium-aluminium mordants.

Detanning Chrome Leather. M. C. Lamb, London. British Patent, 132,864, of 1918.

Chrome leather is detanned and the material used for making glue or gelatine. The chrome leather is immersed in a solution of an organic acid containing two or more hydroxyl groups. Suitable acids are phthalic, lactic, tartaric, succinic, malonic, and oxalic, preferably the last-named. The chromium is recovered from the solution, and the detanned material treated in the usual way for making glue, etc.

Purifying Coal-gas, Etc. E. Bury, O. Ollander, and A. F. Bury, Salthurn-by-Sea, Yorkshire. British Patent, 133,159, of 1918.

Peat-coke, prepared by distilling air-dried peat at a temperature of from 700° to 900° C., is used for the absorption of gases and vapours, such as methylene, benzene, propylene, toluene, xylene, sulphuretted hydrogen, carbon bisulphide, and organic sulphur compounds from the products of distillation of organic material. The absorbed products may be separated by fractional distillation or otherwise. The peat-coke is placed in vessels, preferably combined with scrubbers, and the gases passed over it at approximately normal pressure and temperature. When the peat-coke has been used for some time, it is removed through air-tight mains into a heating-vessel for the removal of the gases and vapours. The residual peat-coke is cooled out of contact with the atmosphere and returned to the absorption chamber for further use.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Ethyl Acetate. Soc des Acieries and Forges de Firminy, Loire, France. British Patent, 131,600. Convention date, March 13, 1918.

Ethyl acetate is made by esterifying acetic acid which has been obtained by the electrolytic oxidation of paraldehyde. The paraldehyde is poured on to the electrolyte, which may be a 10 per cent. solution of sulphuric acid. Oxidation may be aided by the addition of oxides or salts of metals capable of more than one degree of oxidation; for instance, manganese, cerium, molybdenum, or vanadium, to the amount of 0.5–1 per cent. of the quantity of paraldehyde. The temperature may be allowed to rise slightly. When the percentage of acetic acid rises to about 40, an equivalent

quantity of alcohol is added and the mixture distilled in a rectifier. The residual liquid may be used again for electrolysis.

Destructive Distillation. F. P. A. Rousseau, Vendorne, Loir et Cher, France. British Patent, 132,490. Convention date, September 9, 1918.

Liquid hydrocarbons such as petroleum and spirit are distilled from coal, shale, lignites, and distillation residues, resin, pitch, etc., in a series of vessels heated at their upper parts, and the volatile products pass from the bottom of each

vessel into a central condensation chamber also heated at the top. If the material is poor in hydrogen, a current of the gas is circulated through the vessels during the process. The coal, etc., is supplied through a series of valves pipes *d, g* to a perforated hearth *g'*, *g''* within each vessel, and the charge is spread by rotary agitators mounted on vertical shafts *a, v*.

The heating is effected by spiral steam or vapour pipes *c, s* located at the top of each vessel beneath an insulated cover *c, b*. The condensation chamber *D'* may be dispensed with if the lower parts of the distillation vessels be of conical form. In a plant for distilling liquids such as heavy oils and solids of low melting-point, the stills are heated from below, and connect at their upper parts with a condenser heated at the top.

Manures. Norsk Hydro-Elektrisk Kjølstofaktieselskab, Christiania. British Patent, 132,496. Convention date, September 13, 1918.

Fertilisers are obtained by mixing insoluble phosphates with urea salts and kindred substances, the phosphates being rendered soluble. Urea nitrate obtained by treating cyanamide or cyanamide of lime with nitric acid is suitable.

Calcium cyanamide. F. Gros and Bouchardy, Paris. British Patent, 132,622. Convention date, November 3.

Calcium cyanamide is produced by rapidly heating in nitrogen calcium carbide arranged so as to expose a large surface, and moving it through a zone of high temperature without disturbing the lower layers. The product is cooled rapidly. The arrangement described comprises a tunnel

furnace *a* provided with an air lock at each end and with automatic means for conveying trays *b* from the inlet end *f* to the outlet end *g*, while nitrogen passes in the opposite direction. The part *c* is heated, for instance, by electric resistances, so that the charge is heated by radiation from the roof, while the part *e* is not heated, and may be cooled.

Cyanogen Compounds. Nitrogen Corporation, Providence, Rhode Island, U.S.A. British Patent, 133,095. Convention date, June 12, 1917.

The reaction product in the fixation of free nitrogen by the processes described in Specification 27713/12 and 13332/14 is extracted with liquid ammonia to separate the cyanogen compound from the catalytic metal and excess of alkali compound and carbon. The residue is used again. It is stated that sulphur or like impurities should be excluded in the cyanide-forming reaction mixture. The extraction and evaporation to recover the ammonia are effected with exclusion of air unless the product to be obtained is cyanate. The extraction apparatus may be of non-porous iron, or of a porous iron of which the pores have been allowed to choke up with cyanide.

Fatty Acids. Pardubitzer Fabrik der Akt.-Ges. für Mineralöl-Industrie vorm. D. Farnö and Co., Pardubitz, Austria. British Patent, 133,027. Convention date, September 25, 1918.

In the production of fatty acids by oxidising paraffin wax, as described in the parent Specification (No. 131,301), the temperature is regulated, after the reaction has started, by cooling the reaction mass, instead of regulating the air supply. This may be effected by circulating a cooling medium through the heating-coil of the apparatus. Light-coloured products are obtained by effecting the reaction in aluminium, glass, or enamel vessels instead of iron vessels; the heating coil, etc., are also made of such material. Catalysts which do not discolour the product, such as the acids referred to in Specification 131,302, may be employed.

Catalytic Processes. L. Duparc and C. Urfer, Geneva. British Patent, 133,041. Convention date, September 24, 1918.

Ammonia is burnt quantitatively to nitrogen peroxide by passing rapidly an undried mixture of four volumes of ammonia and seven volumes of oxygen, but not air, over a catalyst heated to between 500° and 650° C. As a catalyst, a metal of the platinum group, such as platinum, or preferably rhodium, may be employed and the catalyst may be distributed on asbestos. The ammonia may be obtained by heating its concentrated solution; but it is not satisfactory to pass oxygen through such solution in order to obtain the desired mixture. The nitrogen peroxide is passed into water at 30° C. in order to obtain nitric acid.

NEW COMPANIES.

Majunga Oilfields of Madagascar, Ltd.—Capital £200,000., £1. shares. Office: Colford Chambers, 10, New Bond Street, W.

Nigerian Hydraulic Tin Mines, Ltd.—Capital £10,000., £1. shares. Solicitors: H. Jones, Son and Pott, Capel House, E.C.

Palestine Oil Industry "Shemen," Ltd.—Capital £250,000., £1. shares. Office: 24, Holborn, E.C.

Platinum and Mineral Estates (Colombia), Ltd.—Capital £25,000., in 20,000 preferred ordinary shares of £1. and 100,000 deferred ordinary shares of 1s. each. Office: 17, Victoria Street, S.W.

Rubber and Tin Estates, Ltd.—Capital £10,000., £1. shares. Office: West Africa House, Water Street, Liverpool.

Union Mining and Smelting Company, Ltd.—Capital £500,000., £1. shares. Solicitors: Grundy, Kershaw and Co., 6, Austin Friars, E.C.

United Chemical Corporation, Ltd.—Capital £100,000., 10s. shares. Manufacturing, analytical, wholesale and retail chemists, druggists, dyers, etc. Solicitors: Ashurst, Morris, Crisp and Co., 17, Throgmorton Avenue, E.C.

Winnebuh Tinfields, Ltd.—Capital £100., 10s. shares. Registered office: 17, Farringdon Avenue, E.C.

A. H. Herbert and Co., Ltd.—Private company. Capital £20,000., £1. shares (10,000 preference). Manufacturers and merchants of lead, glass, oil, colours, etc. Registered office: 61-2, Chancery Lane, W.C.

Arthur White and Sons, Ltd.—Private company. Capital £10,000., £1. shares. Lead, zinc, glass, oil, colour, and varnish merchant. Registered office: 61, Atlantic Road, Brixton, S.W.

Charles H. Marchent and Co., Ltd.—Private company. Capital £10,000., £1. shares. Makers of spelters, dealers in copper, gunmetal, brass, zinc, lead, pewter and phosphor bronze, manganese and brass ingots, etc. Registered office: Premier Metal Works, 17, Stott Hill, Bradford.

Erp and Co., Ltd.—Private company. Capital £5,000., £1. shares. Object: To take over patents, rights, contracts, and plant relating to the distillation of wood and other substances, etc. Solicitors: C. C. Tarelli, 62, London Wall, E.C.

Ezypol Syndicate, Ltd.—Private company. Capital £2,000., £1. shares. Manufacturers, importers, and exporters of and dealers in furniture and other polishes, etc. Registered office: 19, Lisle Street, W.C.

Beding (Malaya) Rubber, Ltd.—Private company. Capital £70,000., 2s. shares. Solicitors: Herbert Smith, Goss, King and Gregory, 62, London Wall, E.C.

Hasland Coking Company, Ltd.—Private company. Capital £100,000., £1. shares. Object: To acquire the business of a company of the same name, incorporated in 1905, to carry on the business of coke-oven proprietors, manufacturers of coke, gas tar, pitch, benzole, ammonia, and other by-products, etc. Solicitors: Broomhead, Wightman and Moore, 14, George Street, Sheffield.

Matches, Ltd.—Private company. Capital £100., £1. shares. Manufacturers, producers, importers and exporters of matches, etc. Registered office: Ridgway House, 40-42, King William Street, E.C.

Mossley Colour and Chemical Company, Ltd.—Private company. Capital £5,000., £1. shares. Object: To take over the business of manufacturers and merchants of colours, chemicals, paints, oils, varnishes, etc., carried on at Quickwood Works, Haddens, Mossley, near Manchester, by W. Marvel and J. Marvel, as the "Mossley Colour and Chemical Company." Registered office: Quickwood Works, Haddens, Mossley, near Manchester.

Plumbex, Ltd.—Private company. Capital £15,000., in 12,000 preference shares of £1. each and 60,000 deferred shares of 1s. each. Object: To acquire and develop patent processes for treating or retreating refuse and waste materials of all kinds, or any chemical or other processes or formula, etc. Registered office: 3, Laurence Pountney Hill, E.C.

Stourbridge Hardware, Chemical, and Drysaltery Company, Ltd.—Private company. Capital £5,000., £1. shares. Office: Green Street, Stourbridge.

Zalbide, Alvarez and Co., Ltd.—Private company. Capital £4,000., £1. shares. Foreign and general merchants, manufacturers of and dealers in iron and steel tinplates, chemicals, dyes, asbestos, etc. Registered office: 6, Broad Street House, E.C. 2.

Fairy Dyes, Ltd.—Private company. Capital £10,000., £1. shares. Manufacturers of and dealers in dyes, chemicals, etc. Office: 20, Renfrew Street, Glasgow.

Allchies Copper Mines, Ltd.—Private company. Capital £80,000., £1. shares. Object: To acquire certain mines and mining rights in the County Cork known as the Allchies Mines. Solicitor: I. I. L. Overend, Ely Place, Dublin.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence further information may be obtained:—

Ceylon.

A commission agency at Colombo desires to represent United Kingdom manufacturers and shippers of perfumery, paints, and oils. (Reference No. 1096.)

Belgium.

An agent at Liège desires to represent, on commission, British firms manufacturing aniline and other dyes. (Reference No. 1101.)

A Belgian inquirer at Liège desires to purchase from, and represent on commission, United Kingdom firms manufacturing cement, plaster, and refractory products. (Reference No. 1103.)

A firm of many years' standing at Huy desire to obtain the agency, with dépôt, for British exporters of margarine and soap, etc. (Reference No. 1106.)

Germany.

A commission agent in Wiesbaden desires to obtain a commission agency for the sale of steel cylinders (for oxygen, hydrogen, and carbonic acid gas); spiegeleisen, high-speed tool steel, steel alloys, such as nickel steel, chrome steel, chrome-nickel steel, etc.; oil (engine and lubricating) and tar oil. (Reference No. 1113.)

Italy.

An Italian firm resident in Turin desires to represent British houses dealing in soap and perfumes. (Reference No. 1115.)

Netherlands.

H.M. Consul-General at Rotterdam reports that a firm of manufacturers of chemical and tar solutions for the making of dustless roads are anxious to receive offers of oils, calcium chloride, etc., for road spraying and dust-laying preparations for floors and roads. (Reference No. 1118.)

United States.

An American firm, established at New Orleans, Louisiana, would like to get into touch with United Kingdom manufacturers of chemicals with a view to acting as their representatives in that district. (Reference No. 1135.)

GAZETTE NEWS.**MORTGAGES AND CHARGES.**

Artificial Silk Syndicate, Ltd., London, E.C.—Registered November 12, £5,000. deb., to R. W. Williams, 68, Lombard Street, E.C., and another; general charge. (May 21, 1919.)

London Scientific Instrument Company, Ltd., Manor Park, E.—Registered November 15, £1,700. deb., to Albert Lee and Co., Ltd., 8 and 9, New Zealand Avenue, E.C.; general charge.

Torbay and Dart Paint Company, Ltd., London, E.C.—Registered November 11, £4,000. deb.; general charge.

Vulcan Salvage and De-Tinning Works, Ltd., London, E.C.—Registered November 14, £500. deb., to R. T. Marsh, 57, Bishopsgate, E.C., and another; general charge.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions. Orders, and Official and Other Notices.

West Hartlepool Chemical Manure Company, Ltd.—Resolved October 31, confirmed November 17: That the company be wound up. E. Heslop, 200, York Road, West Hartlepool, accountant, liquidator. Meeting of creditors, Turnbull and Tilly's, 13, Church Street, West Hartlepool, solicitors, December 5. Claims to liquidator by December 31.

Irwell and Eastern Rubber Company, Ltd., Salford.—Resolved October 25, confirmed November 10: That it is desirable to effect an amalgamation of this company with I.

Frankenburg and Sons, Ltd., by transferring the undertaking hereof to a new company, and that, with a view thereto, this company be wound up. W. Bolton, 46, Pall Mall, Manchester, chartered accountant, liquidator, who is authorised to consent to the registration of a new company to be named the Greengate and Irwell Rubber Company, Ltd.

Melyn Tin Plate Company, Ltd., Neath.—Resolved October 22, confirmed November 19: That it is desirable to reconstruct the company, and, accordingly, that the company be wound up. W. H. S. Rees, Charlesville Place, Neath, liquidator, who is authorised to enter into an agreement with a new company about to be formed for the sale to such new company as on September 30, 1919, of the whole of the undertaking and assets of the old company upon terms submitted to said meeting.

Silverton Oil Company, Ltd.—Resolved November 12: That the company be wound up. H. E. Sweeting, 4, Charles Street, Cardiff, chartered accountant, liquidator. Meeting of creditors at liquidator's, December 1.

COMING EVENTS.

Society of Chemical Industry: Manchester Section.—The annual dinner of the Section will be held at the Grand Hotel, Manchester, on Thursday, January 22, 1920, at 7 p.m.

The Ceramic Society.—Meeting, Central School of Science and Technology, Stoke-on-Trent, at 7.30 p.m., Monday, December 8. Paper: "Fine Grinding of Potters' Materials: Part II." by Mr. L. G. Hill.

Oil and Colour Chemists' Association.—Meeting, Food Reform Club, 2, Furnival Street, E.C., Thursday, December 11, at 7 p.m. Paper: "The Principle of Application of Paint and Varnish, and How It Affects the Works Chemist of the Paint and Varnish Industry."

Chemical Engineering Group (Society of Chemical Industry).—Conference, Monday, December 15, from 3 to 5.30 and 7.30 to 10 p.m., at Armstrong College, Newcastle-on-Tyne, on "The Transport and Distribution of Liquids in Chemical Works."

Society of Chemical Industry: Edinburgh and East of Scotland Section.—Meeting, Tuesday, December 9. Paper: "The Oxidation of Ammonia," by Dr. J. Kuen.

MARKET REPORTS.**TAR AND AMMONIA PRODUCTS.****WEDNESDAY.**

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d., naked; pure, 3s., naked at works. Carbolic acid, crude, 60%, East and West Coast, nominally 2s. 3d. to 2s. 4d.; crystals, 39-40%, 8½d. to 9d., f.o.b. Crude tar, London, 50s. to 55s.; Midlands, 50s., North, 50s. per ton, ex works. Refined tar 35s. per barrel. Pitch, 85s.; East Coast, 72s. to 77s. 6d., f.o.b.; West Coast, 72s. 6d. to 75s. f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 95-100%, naked, London, 2s. 9d. to 2s. 10d.; North, 2s. 8d. to 2s. 9d. Crude naphtha, naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 7d. to 2s. 8d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: home trade, December, £21., basis 24½%. Nitrate of soda, £22. 10s. to £22. 15s.

MANCHESTER CHEMICAL MARKET.**THURSDAY.**

Business all round continues satisfactory, with good demand both for home and export account. Values generally are firmer and with an upward tendency. There is keen competition for resale lots of caustic soda, and price of 70% is well held at £26. 10s. per ton. Refined bicarbonate of soda at £11. 10s. and 58% alkali at £11. per ton. Spot price for bleaching powder is unchanged at £17. on rails, but contract price for 1920 has now been fixed at £15. 15s. per ton, carriage paid. Roasted saltcake firm at 70s. in bulk. Chlorates are again dull. Soda at 6d. per lb., and potash 1s. per lb. Bichromates are scarce, but makers' quotations unaltered at 1s. 6d. and 11d. per lb. for potash and soda respectively. Recovered rock sulphur £17., on rails,

Sulphate of copper continues very quiet, and f.o.b. price nominal at £40. per ton. Nitrate of soda scarce and dear at £61. per ton. Commercial hyposulphite of soda £19. per ton. Phosphate of soda £29. to £30. per ton. Concentrated sodium sulphide, in casks, higher at £25. per ton. White powdered arsenic firm at £65., and supplies scarce. Yellow prussiate of soda steady at 1s. per lb. Potash 2s. 1d. per lb. Carbonate of potash quiet at £102. per ton, basis 85%. Lead salts are higher in sympathy with the advance in metal. White acetate £83. 10s.; brown £67. Nitrate £56 per ton. Acetic acid and acetate of soda are firmer. English brown acetate of lime is well maintained at £14. 10s. to £15. per ton; grey £20. per ton. Miscible naphtha 10s. 6d. per gallon. Ammonia salts are steady. Lump carbonate has been advanced to 7½d. per lb., and oxalic acid to 1s. 5d. per lb.

LONDON METAL MARKET.**THURSDAY.**

Copper: Standard brands, £98. 5s. to £98. 10s. cash; £99. 10s. to £99. 15s., three months; electrolytic, £107. to £108. **Tin:** Standard, £294. to £294. 15s. cash; £296. 5s. to £296. 10s. three months; Straits, £294. 10s.; English, £296. 5s. to £296. 10s. **Lead:** Soft foreign, £39. 7s. 6d.; English, £40. 5s. **Spelter,** £50. 10s., hard, £35. **Antimony,** English regulus, 90%, £47. 10s. **Aluminium,** £150. **Nickel,** £215., ex warehouse. **Quicksilver,** £23. to £23. 10s. **Bismuth,** 12s. 6d. **Platinum,** 442s. per oz. **Wolfram,** 32s. 6d. per unit.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on November 29 were: American, 29,050 barrels, compared with 2,587 barrels at the corresponding date of 1918; French, 825 barrels (1,101 barrels); and Spanish, 297 barrels (1,050 barrels). Deliveries during the week ended November 29 were 1,685 barrels, against 1,055 barrels last year; and since

January 1, 69,501 barrels, compared with 24,089 barrels in 1918. The price on Saturday last was 127s. per cwt., compared with 105s. at the corresponding date of last year. January-April (1920) was quoted at 129s. 6d., and May-August 117s.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplate prices are very firm and steady on the basis of 45/6 to 46/- per standard box f.o.b. Copper slightly firmer at £97. prompt and £98. 10s. three months. Tin easier at £295. prompt and £296. 10s. three months. Lead remains active with good sales at £38. prompt and £38. 5s. forward for Spanish, and £39. for English. Spelter sold freely and was very active at £48. 17s. 6d. prompt and £49. over next quarter. Zinc sheets have become firm at £67. for English, and £68. for American f.o.b. at New York. Antimony regulus £47. 10s. f.o.b. prompt; Chinese £44. 10s. Aluminium £150. Quicksilver very firm and dearer at £21. Silver irregular at 73½d. per ounce. Nickel slightly dearer at £215. delivered London or equal. Pitch rather scarce at 62/6 per ton ex ship. Nitrate of soda very firm: ordinary and refined 21/6 to 22/6 per cwt. in bags. Sulphate of copper remains quiet and steady at £41. 10s. per ton f.o.b. Sulphate of ammonia in good movement at £21. per ton. Arsenic in better request, with white powdered at £61. 15s. 6d. per ton f.o.b. Oxalic acid in better request and dearer at 1/2½d. per lb.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

An active demand for the heavier chemicals has again been experienced, the inquiry on export account being fairly brisk. It is evident that the labour will only allow manufacturing in the consuming industries to proceed at its feasible maximum a large increase in the consumption of chemicals must take place, and the trade experience a very active and prosperous time. The uncertainties as to labour's action constitute the main element of doubt and retardation in the chemical industry, and in the commercial branch of the industry—the "trade," as the term is commonly understood. Bleaching powder has been in good request, and is scarce for prompt or early delivery. Prices are £17. per ton, free on rail or conveyance, in buyers' packages; and £15. to £18. per ton for export. Chloride of calcium has been in moderate request, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has been much inquired for, and prices continue very firm. They may be given as £21. per ton for 76%, £22. per ton for 70–72%, and £21. per ton for 60%. Nitrate of soda has been in rather active demand, and the price has hardened; it is £21. 10s. to £22. 10s. per ton. Saltcake has been in very fair request, and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have been steadily called for, and are £5. 10s. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has again been in active demand, and is £8. 5s. to £10. per ton, according to terms of delivery. Borax has been well inquired for, and is £39. per ton for ordinary and £40. per ton for powdered, in bags, less 3%, for lots of not less than 50 tons. Ammonia alkali has had a well-sustained inquiry; it is still scarce, and is £6. 10s. to £6. 15s. per ton, f.o.r. at works. Hyposulphite has been quiet, and is £18. 10s. per ton for ordinary and £22. per ton for pea crystals, in 1cwt. bags. Sulphite of sodium has been in fair request, and is £11. per ton for ordinary and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been in quietly steady demand, and is £22. per ton in casks and £23. per ton in drums. Prussiate of soda has been quiet, and is 1s. per lb. Bichromate of soda has been steadily called for, and is 9½d. per lb. Phosphate of soda has been in somewhat freer demand, and is £27. per ton. Chlorate of potash has been but little inquired for, and is 1s. to 1s. 1d. per lb. Permanganate has been in moderate demand, and is 3s. 6d. per lb. Sulphate of potash has been but little in request, and is £22. 10s. per ton. Carbonate of potash has been in quietly steady demand, and is £95. to £100. per ton for 80–85%. Caustic potash has been in good request, and is £120. per ton. Nitrate of potash has been in very fair demand, and is £60. to £62. per ton for refined and £40. per ton for ordinary. Canadian potashes have been but little in request: first quality Montreal are £200. to £220. per ton, and second quality £190. to £210. per ton. Bichromate of potash has been in quietly steady demand, and is 1s. 6d. per lb. Yellow prussiate of potash has been rather more in request, and is dearer; the price may be given as 1s. 10d. to 2s. per lb. Salammmoniac has been in fair request and is £90. per ton for first quality, £85.

per ton for second quality, and £5. per ton extra for crushed. Sulphate of ammonia has been but little called for, and supplies are still very light; prices are £21. per ton for December, £21. 7s. 6d. for January (1920), £21. 15s. for February, and £22. per ton for March to May (1920). Carbonate of ammonia has been steadily called for, and is 6½d. per lb. Muriate has been quiet, and is £45. to £50. per ton, according to grade. Magnesia has been in somewhat better request. Carbonate is £2. 5s. per cwt., and sulphate £11. to £16. per ton. Alum has met with a fairly brisk inquiry, and supplies for early deliveries are still light; prices are: For the home trade, £18. 10s. per ton, and for export £18. 10s. to £19. 10s. per ton. Aluminoferric has been very quiet, and is £8. 10s. to £12. per ton. Sulphate of alumina has been but little called for, and is £12. to £17. per ton, according to grade. Sulphur has been in good request. English flowers are £32. per ton; roll is £28. per ton; and rock, £22. per ton, in bags, f.o.r. Sicilian grades are: Flowers, £28. per ton; roll, £22. 10s. per ton; and rock, £17. 15s. per ton. Cream of tartar has been in moderately active demand, and is £12. 10s. to £13. per cwt., according to test. Tartaric acid has sold more freely, and is 3s. 2d. per lb. Boracic acid has been in very fair request, and is £72. per ton for crystals and £74. per ton for powdered; £2. to £3. extra being charged per ton for casks. Oxalic acid has been quieter, and is 1s. 3d. per lb. citric acid has been rather more in demand, and is 4s. 3d. per lb. White acetate of lead has moved but slowly, and is £83. to £85. per ton. Arsenic has been in moderate demand, and the supply over and above current contract requirements continues very light. White powdered is £63. to £65. per ton. Sulphate of copper has been quiet, and prices have eased; for the home trade £41. per ton is being asked, and for export £41. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Business is still very active, and both for home and export there is a strong demand, bleaching powder and caustic soda being in particularly good request. Soda crystals locally very scarce and in demand at £5. 10s. per ton 2cwt. bags. Sulphur (best quality) also very firm at £24. to £25. per ton.

Prices per ton net are nominally: Bleaching powder, softs and hard, £17.; caustic soda 76/77%, £26., 74/76%, £25.; do., 70%, £24., do., 60%, £23.; recovered sulphur, 2cwt. bags, £24.; hyposulphate of soda, 5/7cwt. casks, £19., 1cwt. kegs, £20.; sulphite of soda, 5/7cwt. casks, £12., do. 1cwt. kegs, £20.; silicate of soda, 75Tw., £9. 12s. 6d., do., 100Tw., £10. do., 140Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda (salt cake) in bulk, £4.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22.; sulphide of sodium, crystals, £18., do., refined concentrated solid, 60/62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market very brisk, with a strong demand, and the principal collieries have now sufficient orders on hand for the remainder of this year. Nominally prices are as follows: Best Northumbrian steam, 95/- to 100/- per ton, seconds, 90/- to 84/-; Northumberland small coal, 75/- to 80/-, seconds, 70/- to 72/6; best Durham gas coals, 80/- to 85/-, seconds, 65/- to 75/-; Durham bunker coals, 70/- to 80/-, seconds 66/- to 65/-; foundry coke, 100/-; gas coke, 95/-.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

During the past week there has continued a good demand at firm prices and the inquiry for the home market has been very steady. Several articles are again dearer and scarcer, and the most noticeable price variations are in the case of arsenic (which has jumped from £64. to £65. per ton); caustic soda (from £25. to £27.) and salammmoniac (which is now quoted at £90. as against £85. for second lump). Current quotations are: Arsenic, £65. per ton, net, Glasgow; bicarbonate of soda, £10. 10s. and £12. 10s. per ton for 6-8 cwt. casks and 1cwt. kegs, net, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags; and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £27. per ton, net, Glasgow; chlorate of potash, 1s. 2d. per lb., net, Glasgow; chlorate of soda, 8d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 98%, £12. per cwt., net, Glasgow; paraffin wax, U.K. deliveries, 125° to 6½d. to 121-3° 5½d. to 5½d.; 118-20°, 5d.; 110-120°, 4d. to 4½d.; and 98-102°, 4d. to 4½d.; salammmoniac, £95. and £90. per ton, net, any port, for first and second lump respectively; salammmoniac crystals, £70.

per ton, net, Glasgow; saltpetre, £3. 4s. per cwt., net, Glasgow; tartaric acid, 3s. 3d. per lb., 5%, Glasgow.

There are no noticeable changes in the market conditions as far as the different sea oils are concerned, and quotations are all unchanged except in the case of Newfoundland cod—where there is an advance recorded from 80s. to 82s. Among the whale oils pale continues to find buyers at 94s.; brown continues to attract attention at 76s.; and black continues to

be absorbed at 75s.; while yellow is still unobtainable. There are no changes either as regards pale seal or Menhaden and these are still selling at 96s. and 80s. respectively.

There is little new to be said regarding the position in the coal trade, and it is still a case of the inquiry being usually bigger than the demand. Everything which goes to the pit-head is very quickly ear-marked and there is never any surplus of fuel either for household or industrial purposes.

Antofagasta, 200 pkgs.; Bombay, 1,400 pkgs.; Buenos Ayres, 4,309 pkgs.; Concepcion, 82 pkgs.; Hong Kong, 1,792 pkgs.; Helsingfors, 382 pkgs.; Leghorn, 160 pkgs.; Lyttleton, 8 pkgs.; Melbourne, 450 pkgs.; Messina, 70 pkgs.; Moji, 2,867 pkgs.; Penang, 30 pkgs.; Valparaiso, 331 pkgs.; Vera Cruz, 400 pkgs.; Yokohama, 5,237 pkgs.

SODA CRYSTALS—

Bombay, 250 pkgs.; Casablanca, 95 pkgs.; Singapore, 8 pkgs.

SODIUM BICARBONATE—

Aarhus, 105 pkgs.; Amsterdam, 905 pkgs.; Bombay, 2,400 pkgs.; Buenos Ayres, 2,588 pkgs.; Christiania, 60 pkgs.; Constantinople, 230 pkgs.; Dantzic, 600 pkgs.; Genoa, 525 drms.; Halifax, 100 pkgs.; Kobe, 100 pkgs.; Las Palmas, 10 pkgs.; Lyttleton, 1,416 pkgs.; Moji, 323 pkgs.; Napier, 20 pkgs.; Pernambuco, 60 pkgs.; Penang, 30 pkgs.; Sao Paulo, 200 pkgs.; Valparaiso, 1,000 pkgs.; Varna, 16 pkgs.; Velo, 20 pkgs.; Venice, 100 pkgs.; Wanganui, 14 pkgs.; Wellington, 100 pkgs.

SODIUM SALICYLATE—

Odessa, 1 c., \$33.

SODIUM SILICATE—

Alexandria, 194 pkgs.; Boston, 40 pkgs.; Buenos Ayres, 181 pkgs.; Hamburg, 279 pkgs.; Hankow, 50 pkgs.; Maceio, 6 pkgs.; Melbourne, 52 pkgs.; Montreal, 100 pkgs.; Oporto, 426 pkgs.; Pernambuco, 48 cs.; Piraeus, 200 pkgs.; Salonika, 32 pkgs.; Santos, 80 pkgs.; Vancouver, 10 pkgs.

SODIUM SULPHIDE—

Bordeaux, 159 pkgs.; Buenos Ayres, 100 pkgs.; New York, 484 pkgs.; Oporto, 54 pkgs.

SULPHUR—

Kingston, 1 c., \$8.; Montreal, 5 c., \$16.

SULPHURIC ACID—

Alleppey, 19 c., \$37.; Calcutta, 2 c., \$8.; Rio de Janeiro, 1 t. 13 c., \$83.; Sierra Leone, 1 c., \$5.; Valparaiso, 9 c., \$23.

TALLOW—

Galatz, 10 t.

TANNIC ACID—

Odessa, 1 c., \$65.

TAR—

Bathurst, 1 c., \$4.

TARTARIC ACID—

Bombay, 50 lbs., \$5.; Melbourne, 2 t., \$638.; Montreal, 1 t. 10 c., \$495.; Parahyba, 1 c., \$23.; Sydney, 4 t., \$1,276.; Toronto, 1 t. 10 c., \$495.

TIN OXALATE—

Rio de Janeiro, 17 c., \$66.

ZINC CHLORIDE—

Sydney, 1 t. 6 c., \$70.

LONDON.

Week ending November 26.

ACETANILID—

Rangoon, 1 cs., \$10.

ACETIC ACID—

Auckland, 2 cs., \$5.; Antwerp (F.), 5 brls., \$75.; Buenos Ayres, 1 cs., \$5.; Constantinople (F.), 15 cs., \$190.; Montreal, 2 cs., \$7.; Otago, 3 cs., \$8.; Pt. Sudan, 21 cs., \$50.; Salonika, 11 cs., \$138.; Wellington, 6 cs., \$16.

ACETO SALICYLIC ACID—

Batoum, 2 cs., \$25.; Christiania, 20 kgs., \$1,010.; Copenhagen, 3 cs., \$116.; Gothenburg, 33 cs., \$540.; Neppel, 2 brls., \$138.; Piraeus, 6 cs. (pt.), \$18.; Stockholm, 10cs., \$237.

ACETONE—

Antwerp (F.), 61 drms., \$1,795.; Copenhagen, 3 drms., \$88.; Rotterdam (F.), 7 drms., \$32.; Rotterdam, 1 drms., \$31.

ALUM

Colombo, 2 cs., \$6.; East London, 19 cs., \$31.

ALUM (CHROME)—

Cologne, 1 t., \$125.

ALUMINA SULPHATE—

Rotterdam, 2 t. 3 c., \$57.

AMMONIA—

Accra, 18 cs., \$35.; Beira, 3 cs., \$6.; Bombay, 14 cs., \$28.; Bonaire, 42 drms., \$405.; Buenos Ayres, 8 cs., \$16.; Calais, 28 drms., \$295.; Calcutta, 2 cs., \$5.; Durban, 11 cs., \$26.; Hong Kong, 3 cs., \$5.; Karachi, 8 cs., \$15.; Monte Video, 5 cs., \$17.; Rangoon, 3 cs., \$7.; Rio de Janeiro, 10 cs., \$97.

AMMONIA (ANHYDROUS)—

Cape Town, 20 cylds., \$183.; Calcutta, 32 cylds., \$4,024.; Durban, 30 cylds., \$275.; East London, 10 cylds., \$42.; Pt. Elizabeth, 10 cylds., \$42.; Tarquah, 7 cylds., \$129.

AMMONIUM BICARBONATE—

Bombay, 2 c., \$7.

AMMONIUM BICHRONATE—

Calcutta, 1 ck. (pt.), \$5.

AMMONIUM BROMIDE—

Bombay, 1 cs. (pt.), 1 cs., \$29.; Durban (F.), 1 cs., \$10.; Melbourne (F.), 1 cs., \$11.; Piraeus, 1 ck. (pt.), \$6.

AMMONIUM CARBONATE—

Bombay, 2 t., \$166.; Calcutta, 15 c., \$7.; Callao, 1 t., \$66.; Deslorro, 9 c., \$45.; Durban, 1 c., \$5.; Mossel Bay, 2 c., \$10.; Penang, 2 t. 5 c., \$178.; Piraeus, 10 c., \$19.; Rangoon, 1 t., \$74.; Singapore, 3 t., \$314.; Zanzibar, 1 c., \$7.

AMMONIUM FLUORIDE—

Demerara, 6 brls., \$121.

AMMONIUM HYDRATE—

Bombay, 1 cs. (pt.), \$10.

AMMONIUM MOLYBDATE—

Adelphi, 1 cs. (pt.), \$10.

AMMONIUM MURIATE—

Perth, 2 c., \$5.; Rabat, 2 c., \$17.

AMMONIUM PHOSPHATE—

Durban, 7 cs., \$116.

AMMONIUM SULPHATE—

Tripoli, 100 t., \$2,650.

AMMONIUM SULPHOCYANIDE—

Sydney, 2 cs., \$11.

AMYL ACETATE—

Brussels, 1 drms., \$10.; Paris, 6 drms., \$653.

ANTIMONY

Rotterdam, 2 t.

ANTIMONY REGULUS

Rotterdam, 25 t.

ANTIMONY SULPHIDE

Paramagua, 10 c., £21.

ANTIMONY SULPHIDE

Boulogne, 16 cks., 6 kgs., £385.; Kobe, 13 cks., £209.; Italy, 20 cks., £448.; Paris, 13 cks., £240.; Rotterdam, 10 cks., £184.; Santos, 30 cks., £59.; Yokohama, 13 cks., £437.

ANTIMONY TARTRATE

Brussels, 2 cks., £33.; Bombay, 1 cs. (pt.), £8.; Gothenburg, 8 kgs., £150.; Odense, 3 kgs., £54.

BARIUM NITRATE

Antwerp, 100 cs., 13 cks., £550.

BENZALDEHYDE

Stockholm, 1 cs., £20.

BEESWAX

Antwerp, 1 t. 3 c.; Copenhagen, 1 t.; Norrköping, 1 c.

BLEACHING POWDER

Pernambuco, 9 t. 18 c., £157.

BISMUTH

Bombay, 1 cs. (pt.), £10.; Naples, 1 cs., £250.; Shanghai, 2 cs., 2 cs. (pt.), £166.

BISMUTH CARBONATE

Cape Town, 30 lbs., (pt.), £22.; Durban, 1 cs., £87.; Piraeus, 1 cs. (pt.), £10.

BISMUTH SALTS

Cape Town, 30 lbs., (pt.), £5.; Piraeus, 2 cs. (pt.), £8.

BISMUTH SALTS

Adelaide, 1 cs. (pt.), £44.

BISMUTH SUBGALLATE

Cape Town, 30 lbs., (pt.), £5.; Piraeus, 1 cs. (pt.), £8.

BISMUTH SUBNITRATE

Cape Town, 30 lbs., (pt.), £10.; Copenhagen, 1 cs., £17.; Odense, 1 cs., £22.; Piraeus, 1 cs. (pt.), £9.

BORAX

Antwerp, 15 t. 2 c., £24.; Antwerp, 20 t. (F.), £780.; Beira, 7 c., £15.; Cadix, 10 t. 11 c., £1,933.; Calcutta, 5 c., £12.; Cape Town, 3 c., £15.; Christiania, 1 t. 10 c., £8.; Durban, 5 c., £19.; East London, 2 c., £5.; Hamburg, 1 t., £250.; Gothenburg, 2 t. 2 c., £84.; Gothenburg, 5 t. 10 c., £230.; Geraldton, 1 c., £11.; Jibau, 16 c., £11.; Lihle, 10 c., £11.; (Finland), 1 t. £15.; Nantes, 17 c., £12.; Rangoon, 2 t. 3 c., £82.; Shanghai, 7 c., £15.; Stockholm, 1 t., £40.; Warsaw, 1 t., £45.

BORIC ACID

Asuncion, 2 c., £19.; Constantinople, 4 c., £32.; Gothenburg, 3 t. 19 c. (F.), £294.; Medan, Deli, 4 c., £15.; Switzerland, via Ostend, 5 c., £18.; Rotterdam, 1 t. (F.), £74.; Shanghai, 1 t. 5 c., £95.; Stockholm, 2 t. (F.), £114.

BUTYRIC ACID

Rotterdam, 1 cys., £27.

CACODYLIC ACID

Boston, 1 cs., £93.

CALCIUM CARBIDE

Calcutta, 5 c., £6.; Channel Is. (F.), 1 t., £27.; Sase, 1 cs., £6.

CALCIUM CARBONATE

Adelaide, 5 bgs., £6.; Marseilles, 13 bgs., £28.; Shanghai, 15 cks., £34.

CALCIUM HYPOPHOSPHITE

Calcutta, 2 cs., £10.; New York, 40 cs., £870.

CARBON BISULPHIDE

Copenhagen, 20 drms., £30.; Durban, 1 drms., £8.

CARBONATE OF LIME

Buenos Ayres, 11 cks., £14.

CARNAUBA WAX

Amsterdam, 10 c.

CAUSTIC POTASH

Calcutta, 1 cs. (pt.), £9.

CAUSTIC SODA

Barbados, 5 c., £19.; Havre, 4 t. 2 c., £137.; Malacca, 2 c., £39.; Naples, 20 t. 9 c., £409.; Shanghai, 7 c., £29.

CELLULOSE ACETATE

Calais, 1 sk., £20.

CERESINE WAX

Adelaide, 2 t.; Antwerp, 3 t.; Christiania, 10 c.; Wellington, 2 t. 1 c.

CHEMICALS (otherwise undescribed)

Adelaide, 7 cs., £50.; Alexandria, 1 cs., £21.; Auckland, 5 cs., £61.; Beira, 1 cs., £10.; Bilbao, 1 cs., £7.; Bombay, 2 pkgs., £20.; Brisbane, 1 cs., £33.; Buenos Ayres, 13 cs. (pt.), £65.; Christchurch, 2 cs., £9.; Constantinople, 3 cs., £46.; Durban, 1 cs. (pt.), £5.; Kobe, 2 cs., £98.; Melbourne, 17 pkgs., £143.; Piraeus, 15 pkgs., £652.; Rangoon, 14 cs., £278.; Rio de Janeiro, 13 pkgs., £490.; Singapore, 3 cs., £64.; Shanghai, 4 pkgs. (pt.), £64.; Sydney, 5 pkgs., £32.; Tokio, 2 cs., £148.; Wellington, 3 cs., £20.

CITRIC ACID

Barcelona, 1 t., £469.; Bilbao, 10 c. (F.), £235.; Bombay, 5 c. (F.), £110.; Bombay, 1 t. 5 c., £630.; Cape Town, 1 cs. (F.), £31.; East London, 1 cs. (pt.), £6.; Kobe, 3 t., £1,290.; Malmo, 15 c. (F.), £378.; Montreal, 3 t., £1,321.; New York, 10 c., £227.; Piraeus, 1 cs. (pt.), £6.; Pt. Elizabeth, 1 c. (F.), £15.; Trinidad, 1 c. (F.), £15.

COAL PRODUCTSAniline Chlorohydrate
Smyna, 3 cks., £123.**Aniline Colour**

Jaffa, 1 cs. (pt.), £7.; Jamaica, 1 cs. (pt.), £9.; Melbourne, 2 cs. (pt.), £91.

Aniline Dye

Genoa, 10 pkgs., £377.; Santos, 3 cs., £30.

Aniline Salt

Alexandria, 5 cks., £84.

Auramine

Bombay, 4 cks., £530.

Bitumen

Bombay, 117 cks., £842.

Carbolic Acid

Brisbane, 4 cs., £24.; Cape Town, 1 drms., £9.; Channel Islands, 10 cks., £79.; Fiji Islands, 3 cs., £11.; Hamstad, 125 cks., £1,100.; Helsingfors, 54 cks., £437.; Piraeus, 4 cs. (pt.), £15.; Sekondi, 10 drms., £20.

MANGANESE BORATE

Copenhagen, 1 c., £10.

MERCURIALS

Bombay, 3 cs. (pt.), £49.; Calcutta, 1 cs., £37.; Shanghai, 4 cs. (pt.), £49.; Trinidad, 1 cs., £26.

MERCURIAL SALTS

Adelaide, 1 cs. (pt.), £11.

MERCURY BICHLORATE

Switzerland, 2 cs., £120.

MERCURY SUBCHLORIDE

East London, 1 cs. (pt.), £7.

METHYL ACETONE

Durban, 7 drms., £77.

METHYL SALICYLATE

Batoum, 1 cs., £11.; Santos, 1 cs. (pt.), £12.; Stockholm, 2 drms., £39.

MINERAL WAX

Antwerp, 1 t. 10 c.

MURIATIC ACID

Santos, 2 t. 9 c., £143.

NITRATE OF LIME

Mauritius (F.), 173 t., £3,760.

NITRIC ACID

Durban, 17 c., £36.; Piraeus, 2 c., £10.; Sekondi, 6 c., £23.

OXALIC ACID—

Brisbane (F.), 1 ck., £23.; Calcutta, 1 kg., £8.; Florence, 2 cks., £72.; Fremantle, 1 kg., £7.; Sydney, 1 kg., £8.

PARAFFIN WAX—

Antwerp, 5 t. 4 c.

PARALDEHYDE—

Cape Town, 1 cs. (pt.), £13.; East London, 1 cs. (pt.), £13.

PHOSPHORIC ACID—

Adelaide, 4 cs., £13.; Melbourne, 32 cs., £16.; Paris, 101 cbys., £1,156.

PHOSPHORUS—

Piraeus, 4 c., £55.

PICRIC ACID—

Pladjoe, 1 cs., £6.

PLUMBAGO—

Barcelona, 9 c.; Copenhagen, 7 c.

POTASH COMPOUNDS—

Shanghai, 1 cs. (pt.), £28.

POTASSIUM ACETATE—

Calcutta, 2 cs., 1 cs. (pt.), £26.; Shanghai, 2 cs., £20.

POTASSIUM BICARBONATE—

Calcutta, 1 cs., £8.; Piraeus, 4 pkgs. (pt.), 3 cs. (pt.), £10.; Wellington, 1 c., £7.

POTASSIUM BROMIDE—

Bombay, 1 cs., 2 cs. (pt.), £41.; Brisbane, 2 cs., £27.; Cape Town, 30 pkgs. (pt.), £9.; Durban, 1 cs. (pt.), £9.; East London, 1 cs. (pt.), £9.; Perth, 2 cs., £45.; Piraeus, 1 ck. (pt.), 1 cs. (pt.), £15.

POTASSIUM CARBONATE—

Constantinople, 1 cs. (pt.), £5.; Rio de Janeiro, 1 ck. (pt.), £7.

POTASSIUM CHLORATE—

Perth, 1 cs., £7.

POTASSIUM CITRATE—

Bombay, 2 cs., £52.; Durban, 1 cs. (pt.), £7.; Melbourne, 1 cs. (pt.), £28.; Shanghai, 1 cs. (pt.), £7.

POTASSIUM CYANIDE—

Bombay, 3 cs., £53.; Bahia, 1 cs. (pt.), £6.

POTASSIUM FERRICYANIDE—

Durban, 1 cs. (pt.), £6.

POTASSIUM IODIDE—

Brussels, 4 cs., £341.; Bombay, 1 cs. (pt.), 2 cs., £179.; Cape Town, 30 pkgs. (pt.), £39.; Christiania, 3 cs., £336.; Galatz, 1 cs., £86.; Melbourne, 1 cs., £84.; Piraeus, 1 cs. (pt.), £20.; Rotterdam (F.), 2 cs., £160.; Shanghai, 2 cs., £173.

POTASSIUM METABISULPHITE—

Montreal, 1 t., 40 cs., £877.; Paris, 15 cs., £70.; Piraeus (F.), 2 kgs., 3 cs. (pt.), £29.

POTASSIUM PERMANGANATE—

Brussels (F.), 1 cs., £10.; Calcutta, 1 cs. (pt.), £13.; Piraeus, 1 ck. (pt.), 1 cs. (pt.), £17.

POTASSIUM PRUSSIANE—

Ghent, 5 c., £52.; Santos, 1 drm., £15.; Yokohama, 5 t., £986.

POTASSIUM SULPHATE—

Brisbane, 1 cs., £4.; Lisbon, 2 c., £22.

POTASSIUM SULPHOGUAIACOLATE—

Piraeus, 1 cs. (pt.), £9.

POTASSIUM TARTRATE—

Stockholm, 3 kgs., £21.

QUININE—

Bombay, 30 ozs.; Calcutta, 1,295 ozs.

RESORCIN—

Galatz, 1 cs. (pt.), £6.

SODA (CALCINED)

Havre, 8 c., £7.

SODA ASH

Genoa, 15 t. 10 c., £175.; Rotterdam, 9 t., £84.

SODA COMPOUNDS—

Bombay, 2 cs. (pt.), £14.; Shanghai, 1 t. 1 c., £11.

SODIUM ARSENATE

Cape Town, 1 kg., £10.

SODIUM ARSENITE

Durban, 18 c., £64.

SODIUM BENZOATE

Athens (F.), 1 c., £34.; Piraeus, 1 cs. (pt.), £7.; Malaga, 1 c., £26.

SODIUM BICARBONATE—

Antwerp, 15 t., £138.; Bombay, 6 c., £6.; Calcutta, 2 c., £6.; Cape Town, 1 t. 4 c., £47.; Christiania, 2 t., £74.; Cologne, 5 t., £70.; Durban, 4 c., £8.; Geraldton, 5 c., £7.; Hamburg, 25 t. 10 c., £383.; Mossel Bay, 12 c., £23.; Piraeus, 1 t., £18.; St. John, N.B., 4 c., £7.; Smyrna, 5 c., £11.; Tientsin, 1 c., £5.

SODIUM BISULPHITE—

Paris, 5 c., £8.

SODIUM BROMIDE—

Christchurch, 2 pkgs. (pt.), £7.

SODIUM CARBONATE—

Rio de Janeiro, 2 c., £12.

SODIUM CHLORIDE—

Brussels, 10 c., £14.

SODIUM CITRATE—

Calcutta, 12 cs. (pt.), £6.

SODIUM HYDRATE—

Lisbon, 1 cs. (pt.), £8.

SODIUM HYPO—

Antwerp, 5 t., £112.; Colombo, 2 c., £6.; Constantinople, 2 t. 5 c., £63.; Lisbon, 1 t. 7 c., £24.; Shanghai, 1 t., £14.; Singapore, 1 t., £28.; Swatow, 10 c., £15.

SODIUM HYPHOSPHITE—

New York, 20 cs., £510.

SODIUM IODIDE—

Bombay, 1 cs. (pt.), £12.; Calcutta, 2 cs. (pt.), £35.; Gothenburg, 3 cs., £282.; Shanghai, 1 cs. (pt.), £23.

SODIUM METABISULPHITE—

Antwerp, 2 t. 5 c., £100.

SODIUM PYRO—

Leghorn, 1 t., £85.

SODIUM SALICYLATE—

Batoum, 7 kgs., £135.; Bombay, 1 cs., £11.; Cape Town, 2 cs. (pt.), £20.; Durban, 1 cs. (pt.), £8.; East London, 1 cs. (pt.), £9.; Fremantle, 1 kg., £17.; Montreal, 1 kg., £19.; Piraeus, 3 kgs. (pt.), £16.; Shanghai, 1 cs. (pt.), £5.; Sydney, 1 cs. (pt.), £8.

SODIUM SILICOFLOURIDE—

Copenhagen, 1 bg., £5.

SODIUM SULPHATE—

Durban, 8 c., £10.

SODIUM SULPHATE (GLAUBER SALTS)—

Barbados, 13 c., £7.; Boulogne, 1 t., £12.; Melbourne, 9 c., £6.; Paris, 6 t. 1 c., £45.

SODIUM SULPHITE—

Colombo, 2 c., £7.; Otago, 9 c., £5.; Rio de Janeiro, 2 c., £19.; Sourabaya, 1 cs., £14.

SODIUM TARTRATE—

Melbourne, 3 c., £17.; Montreal, 5 c., £35.; New York, 1 t., £140.

STEARINE—

Rotterdam, 5 c.

STRONTIUM AND BARIUM NITRATE—

Madras, 33 cs., £129.

SULPHUR

Aden, 5 c., £10.; Copenhagen, 1 t. 1 c., £70.; Lisbon, 22 t. 11 c., £597.; Stockholm, 10 c., £31.

SULPHUR (FLOWERS)—

Lisbon, 2 t. 3 c., £79.

SULPHURIC ACID—

Antofagasta, 15 c., £55.; Hong Kong, 3 c., £5.; Pt. Swettenham, 10 c., £12.; Rio de Janeiro, 1 t. 4 c., £63.; Sekondi, 2 t. 10 c., £100.; Shanghai, 7 c., £34.; Tarquah, 1 t. 4 c., £36.; Suez, 2 c., £6.

TALLOW—

Colombo, 7 c.; Marseilles, 10 c.

TANNIC ACID—

Piraeus (F.), 1 cs. (pt.), 4 pkgs. (pt.), £14.; Sydney (F.), 1 cs., £7.

TANNIN ALBUMINATE—

Dantzig (F.), 1 ck., £14.; Galatz, 1 cs. (pt.), £7.

TAR (STOCKHOLM)—

Durban, £49.

TARTARIC ACID—

Beira, 1 c. (F.), £12.; Bombay, 13 c., £242.; Cape Town, 2 c. (F.), £47.; Calcutta, 1 c. (F.), £22.; Christiania, 15 c., £290.; Durban, 1 c., £18.; East London, 2 c., £39.; Hong Kong, 9 c., £177.; Melbourne, 1 t., £304.; Montreal, 5 t., £1,551.; Mossel Bay, 1 c. (F.), £23.; New York, 2 t. 10 c., £890.; New York, 1 t. 5 c. (F.), £450.; Pt. Elizabeth, 2 c. (F.), £46.; Stockholm, 10 c., £182.; Tientsin, 1 c. (F.), £16.

WAX—

Barcelona, 11 c.; Bordeaux, 1 t. 6 c.; Malmo, 1 t. 4 c.; Sydney, 2 c.

WHITE LEAD—

Accra, £20.; Antofagasta, £830.; Barbados, £107.; Bordeaux, £316.; Bombay, £570.; Cape Town, £32.; Calcutta, £875.; Channel Islands, £16.; Lagos, £52.; Madras, £1,898.; New York, £12.; Paris, £651.; Rangoon, £103.; Shanghai, £200.; Singapore, £152.

XYLIDINE—

Paris, 1 drm., £185.

MANCHESTER.

Week ending November 26.

AMMONIUM CARBONATE—

Rouen, 30 cks.

BARIUM CHLORIDE—

Rouen, 17 cks.

BARIUM SULPHOCYANIDE—

Rouen, 17 cks.

BORAX CRYSTALS—

Rouen, 50 bgs.

CAUSTIC SODA—

Puerto Mexico, 226 drms.

SIZE—

Antwerp, 3 cks.

SOAP—

Antwerp, 152 cs.

SODA ASH—

Puerto Mexico, 50 bgs.

MIDDLESBROUGH.

Week ending November 29.

AMMONIUM SULPHATE—

Kobe, 1,150 t., £13,581.; Yokohama, 1,000 t., £13,002.

BARIUM CITRATE—

Antwerp, 21,572 t., £2,411.

CAUSTIC SODA—

Kobe, 50 t., £770.; Yokohama, 50 t., £770.

COAL PRODUCTS—

Benzol
Germant, 21,572 t., £2,411.; Rotterdam, 1,000 t., £197.
Cresylic Acid
Kobe, 2 t., £38.

Naphthalene
Shanghai, 40 t., £180.

MAGNESIUM CARBONATE—

Milan, 20 t., £891.

PITCH—

Antwerp, 2,250 t., £8,326.; Bizenta, 2,489 t., £8,020.; Caen, 901 t., £2,931.

NEWCASTLE-ON-TYNE

Week ending November 29.

ANTIMONY—

Rotterdam, 100 t.

ANTIMONY (RUDE)—

Rotterdam, 50 t.

BITUMASTIC SOLUTION

Rotterdam, 2 t.

BLEACHING POWDER

Rotterdam, 5 t.

CAUSTIC SODA—

Rotterdam, 33 t.

CHINA CLAY

Bergen, 17 c.

RED LEAD

Rotterdam, 11 t. 5 c.

SOAP—

Rotterdam, 1 t. 5 c.

SODA CRYSTALS

Rotterdam, 10 t.

WHITE LEAD—

Rotterdam, 5 t.

N. & S. SHIELDS.

Week ending November 29.

CAUSTIC SODA—

— 1 t. 182 c.

SOAP—

— 2 t. 81 c.

SWANSEA.

Week ending November 29.

NIL.

PRICES CURRENT.

THURSDAY, Dec 4, 1919.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified.
The prices in different localities may vary.

Acids:—

		£	s.	d.
*Acetic 40% and 60%	per cwt.	31/-	&	46/-

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Postal Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS

TRADE RETURNS.

BRITISH overseas trade, as reflected in the Board of Trade returns for November, appears to be making good progress towards recovery, and in this respect continues the tendency exhibited by the preceding month's statistics. In one important respect, however, last month's returns differ from those of October, and that is in the value of the total imports, which were nearly £10,000,000. less in the month under review and the lowest since June. Exports were higher by over £8,000,000. compared with the previous month, and the combined effect has been a marked contraction in the margin between imports and exports. The total imports were valued at £143,565,000., against £153,486,000. in October, and £116,771,000. in November, 1918; the exports were valued at £87,110,000., compared with £79,061,000. and £43,219,000. Whilst on the import side the increase, compared with a twelve-month ago, was divided between foodstuffs and raw materials and semi-manufactured goods—the receipts of manufactures being less than in the corresponding month of last year,—the improvement in exports was due mainly to bigger shipments of articles "wholly or mainly manufactured." As regards the foreign trade in chemicals and allied products, the most striking feature is the remarkable increase in exports compared both with October and November of last year. Imports of chemicals, drugs, dyes, and colours were slightly less than in the preceding month, but nearly £1,500,000. below the level of the imports in the corresponding period of 1918. The exports of chemical products were valued at £2,866,000., compared with £2,547,000. in October, and £2,016,817. in November, 1918; and the imports £1,922,000., against £1,967,000. and £3,394,000. As one might expect from the figures quoted, few chemical products included in the export section declined as compared with a year ago. The shipments of bleaching powder increased from 3,648cwt. in November, 1918, to 35,021cwt. last month; coal products, not dyes, an increase in value from £313,919. to £391,790.; dyestuffs, from 9,618cwt. to

16,973cwt. ; crude glycerine, from 1,390cwt. to 1,459cwt. ; distilled glycerine, from 1,803cwt. to 5,221cwt. ; sulphate of ammonia, from 2,697 tons to 10,058 tons (mainly to France, Spain and the Canary Islands, Japan, and "other countries"); superphosphates, from 499 tons to 757 tons; basic slag, from 426 tons to 1,237 tons; chemical manures, unenumerated, from 3,524 tons to 4,915 tons; muriate of ammonia, from 2,867cwt. to 8,375cwt. ; white lead, from 434cwt. to 14,365cwt. ; zinc white, from 198cwt. to 2,676cwt. ; painters' colours and materials, unenumerated, from 36,512cwt. to 118,290cwt. ; saltpetre, from 1,491cwt. to 11,090cwt. ; chromate and bichromate of potash, from 488cwt. to 1,281cwt. ; potash compounds, other sorts, an increase in value from £2,589 to £12,259 ; sodium bicarbonate, from 29,162cwt. to 47,868cwt. ; caustic soda, from 52,289cwt. to 89,153cwt. ; soda crystals, from 213cwt. to 14,431cwt. ; sodium sulphate, from 68,204cwt. to 124,408cwt. ; soda compounds, other sorts, from 48,331cwt. to 57,104cwt. ; sulphuric acid, from 457cwt. to 934cwt. ; tartaric acid, from 62cwt. to 800cwt. ; and chemicals, other sorts, an increase in value from £449,333. to £503,847. The exports of copper sulphate declined from 2,792 tons to 1,340 tons; barytes, from 2,400cwt. to 1,698cwt. ; soda ash, from 459,572cwt. to 261,944cwt. ; and sodium chromate and bichromate, from 3,884cwt. to 3,774cwt. In the import branch, acetic acid increased from 567cwt. to 6,390cwt. ; boracite, borate of lime, etc., from 1,993cwt. to 18,768cwt. ; cream of tartar, from 3,754cwt. to 5,683cwt. ; potash compounds, other sorts, an increase in value from £28,093. to £68,715. ; tartaric acid, from 877cwt. to 3,330cwt. ; barytes, from 9,600cwt. to 23,578cwt. ; red lead, from "nil" to 102cwt. ; white lead, from "nil" to 12,568cwt. ; zinc oxide, from 2,721cwt. to 6,096cwt. ; painters' colours and pigments, unenumerated, from 17,019cwt. to 28,835cwt. ; and nitrate of soda, from "nil" to 1,900 tons. Declines were shown in the imports of sulphur, from 68,385cwt. to 9,947cwt. ; carbide of calcium, from 48,537cwt. to 27,252cwt. ; crude glycerine, from 20,124cwt. to 6,112cwt. ; saltpetre, from 54,859cwt. to 2,000cwt. ; soda compounds, from 9,406cwt. to 4,026cwt. ; chemicals, unenumerated, a decline in value from £1,666,990. to £197,472. ; nickel oxide, from 1,958cwt. to "nil" ; and phosphate of lime and rock phosphate, from 43,507 tons to 18,567 tons.

WHAT IS A CATALYST?

DURING the reading of the paper at the Royal Society of Arts on the oil seed crushing industry, dealt with on another page, there was a more or less light interlude, for which the Chairman (Lord Lamington) was responsible. Whilst Mr. J. W. Pearson, the author of the paper, was giving a few details of the hardening or hydrogenating process and mentioned the use of a catalyst, the Chairman innocently asked "What is a catalyst?" The author and a large proportion of his audience, who were evidently chemists, saw the humour of the question and a hearty laugh greeted it. Mr. Pearson cleverly put it on to his chemist friends to give the explanation, adding that he could only describe

the effect of a catalyst. Several subsequent attempts, however, did not throw any light on the much-discussed problem of how it is that a catalyst produces the effect it does. For instance, Mr. E. C. de Segundo, in his usual eloquent manner, said he had inquired of his chemist friends how that mysterious agent which was called a catalyst works, but they simply referred him to the Greek derivation, which, however, left him absolutely cold. He himself thought the action of a catalyst could best be described as a function in chemical force analogous to that filled by a clergyman in human affairs, in that it brought about the combination of two bodies while itself remaining unaffected thereby or the consequences thereof. The next effort was by Mr. Walter F. Reid, who said it was one of those names which chemists invented to hide up a large amount of ignorance. Dr. Voelcker, however, was determined to be serious, and he described a catalyst as a body, the presence of which is necessary for the production of changes in other bodies, whilst itself undergoing no change. This seems to be the length to which our best dictionaries go, but although we agree with Dr. Voelcker that a definition of that kind must be accepted as meeting our present knowledge, it does not answer the question of Lord Lamington, who, we fancy, rather enjoyed being in the position of the child who puts embarrassing questions to its elders. In the hope that somebody else may have a try to explain the precise reasons why a catalyst produces the effect it does, we conclude as we began by asking "What is a catalyst?"

SHIFT WORKERS' WAGES.

AS announced in our issue of October 11, the proposals of the workmen's representatives on the Chemical Trade Shift Inquiry Committee were to be submitted at an early date to the members of the Chemical Employers' Federation, which body has now announced its decision. The proposals, it may be stated at once, have been rejected, for reasons which to any impartial mind will appear to be wholly justified. Briefly stated, the proposals were that, in order to compensate for the reduction in earnings resulting from the rearrangement of working hours, minimum rates of 1s. 6d. and 1s. 8d. per hour for day workers and shiftmen respectively should be fixed. The case for the employers could not have been more clearly or more simply stated than has been done in the report prepared by their representatives. Day labourers have received advances averaging 176 per cent. and shiftmen 160.7 per cent. on pre-war wages, in order to meet an increase of 125 per cent. in the cost of living, and notwithstanding a considerable reduction in the number of working hours in accordance with an agreement arrived at by the men's leaders and the employers' representatives, which agreement, the Federation rightly urges, should be loyally adhered to. The employers submit that the demands emanated not from any unrest among the workmen themselves, but from the trade-union officials, and it is this mischievous activity, which seems to be a fundamental part of the equipment of the present-day trade-union leader, that has been responsible for most of the labour troubles of the past few years.

CHLORINE CELLS.*

By F. G. WHEELER.

IN the operation of all chemical machinery questions regarding the various forms of construction and the best methods of operation are of prime importance to the engineer. This is particularly true of the electrolytic alkali industry, where many varying conditions in the application of the process exist. To answer some of these questions, the writer has experimented for many years and has investigated many phases of this process. The results of these experiments have been embodied in several plants which are working on a large commercial scale to-day.

The most prominent questions which were solved were those regarding the efficiency of a cell, the overload capacity, the influence of temperature, the problem of feeding a cell constantly with brine, the impregnation of anodes, and the many conditions governing cell operation.

The type of cell which the writer adopted is one the form of which was first used by James Hargreaves in 1894. It was later developed by James Mercer and put into practical operation at Haverhill, Mass., in 1898. It was also used by Merry and Noble in England and later by Arthur Gibbs in the United States. The cell is cylindrical in form and built so that the entire exterior surface is cathode. Like a drum, it is able to withstand pressure from within without bracing and without distortion. This form of cell has been adopted by several of the largest electrolytic alkali manufacturers, and there are undoubtedly more cells of this type in operation than any other one form, and possibly all forms combined.

The cylindrical shape has the advantage of requiring no joints except those at the ends, which are held tight by means of a hoop. As a barrel is one of the cheapest forms of package, this form of cell is the cheapest to build. It adapts itself with the greatest ease to the many varying conditions which arise and is remarkably successful from a commercial standpoint.

The efficiency of a cell, by which we mean the proportion of product made compared to the amount of electricity used, was early observed by Hargreaves to be a function of the strength of liquor delivered—that is, the lower the percentage of hydroxide in the cathode liquor, the higher the efficiency. Hargreaves concluded that it was impossible to produce caustic soda with an electrolytic cell because of this action of the concentrated caustic soda. He fully understood the fact that if brine were passed through a diaphragm in contact with a perforated sheet of metal, which was made the cathode of a cell, and if one-half of the brine or less were converted to caustic soda, an efficiency approximating unity was easily obtained. He also used the idea of adding steam to the empty cathode compartment in order to wash the caustic away from the cathode to prevent the hydroxide ions from migrating into the anode solution. His idea, however, was to make a pure product in the cell, and he did not consider the manufacture of a solution of caustic soda mixed with salt and purifying it for commercial use.

THE DIAPHRAGM PROBLEM.

In our first experiments, we found that the caustic could be washed away from the cathode by using a very thin diaphragm which was very easily permeable to the

brine. In the commercial operation of a cell, the diaphragm becomes plugged not only with the impurities which might escape the filters, but with those made in the cell itself—such as disintegrated graphite—and from the action of the liquor on the diaphragm itself. It is obvious from this that the thinner a diaphragm can be made, the more slowly will it become impermeable. It is also apparent that the thinner it is, the less capillary action is present to hold the caustic soda solution between the two electrodes after it has once been formed.

The problem of making cheaply a very thin diaphragm is one of using a cathode which will hold such a diaphragm in position. The idea of supporting a diaphragm with the cathode is an old one and was used first by Hargreaves, and mentioned in his patent of December 28, 1897. To apply this principle, a cathode was first designed using two sheets of metal. The inner sheet was a thin sheet having large perforations, and the outer was a heavier one having fine perforations. The idea was to place a thin sheet of asbestos paper against the inner sheet of the cathode. If it should attempt to burst through the large perforation of the inner sheet due to the pressure of the brine from within, the outer sheet would prevent its rupture, yet would still allow the products of electrolysis to be removed from the field of reaction.

A double cathode of this type is expensive to build and difficult to handle, so that a single sheet was devised which had all of the advantages of the double sheet. This cathode is made by displacing the metal removed from the large perforation backward, but not detaching it from one edge, leaving the flap in such a position that it prevents rupture of the diaphragm, but still leaves a three-sided perforation for the removal of the products of electrolysis. A cell with this cathode is so designed that the edge formed in each large perforation is not thick enough to cut the diaphragm, yet at the same time the sheet of metal is heavy enough to conduct the current economically. These properties have been ascertained, so the construction of a commercial cell is simple.

Cells built as described have an efficiency approximating unity over long periods of time, and plants are now operating with a commercial efficiency of over 95 per cent. with no difficulties from diaphragms or cathodes.

Many industries require cells which can be shut down without damage, so this question was carefully examined. The usual difficulties connected with shutting down a cell arise from changes of temperature and also changes in the delivery of the hydrogen gas. The caustic soda which is formed on the cathode passes with the hydrogen gas through the openings in the cathode and is discharged into the cathode chamber. When a cell is shut down the evolution of the hydrogen ceases, together with the consequent reducing action of the nascent hydrogen at the cathode. The diaphragm is then pressed against the cathode by the brine in such a way that the tiny passages which have been occupied by hydrogen are closed. The chlorine in the brine is not reduced by the nascent hydrogen evolved at the cathode during operation, but attacks the metal, forming ferric chloride. This passes with the brine into the cathode compartment of the cell. A small amount is retained in the diaphragm by capillary action. When the current is again started, the caustic

* *Met. and Chem. Eng.*, New York.

soda, which is first formed, changes the ferric chloride into gelatinous ferric hydroxide, which partially plugs the diaphragm. The hydrogen formed simultaneously with the caustic soda has no easy method of egress or open passages, but must force its way through the pulpy diaphragm until it reaches the nearest opening in the cathode. The cells, therefore, do not deliver the caustic after a shut-down as easily as they did before. As the cell becomes warmer, the viscosity of the brine decreases so that it flows through the diaphragm more readily, the ferric hydroxide is slowly removed by the brine, the hydrogen creates passages to the nearest openings, and the cell returns to its previous operating condition.

EFFECT OF STEAM TREATMENT.

The effect of steam, which is blown into the cathode compartment, was tested with various results. As predicted by Hargreaves, the steam dilutes the caustic soda on the cathode, and in this way helps to keep the efficiency of a cell high. The condensation of the steam on the jacket is easily cared for by trapping it away from the cathode liquor, so that this steam does not dilute the solution, but the condensation on the cathode itself has to be re-evaporated in the concentration department. The steam keeps the cell hot, lowers the viscosity of the brine, causing it to flow more easily through the diaphragm, reduces the concentration of the hydroxide ions, increasing the efficiency. A cell was operated for several months at an efficiency so close to unity that the difference could not be found by ordinary experiments. Cells which were old and worn out, and had been impermeable to the brine, were treated with steam and responded as mentioned above, the efficiency being increased somewhat, but the cost of renewal of a diaphragm is so small, and the additional cost of reconcentrating the solution so high, that no real advantage is gained. The question is simply a commercial one. If power is expensive, it may pay to use steam to save power, but where the power is cheap, the question would be an entirely different one.

RATING OF CELLS.

Many cells are given a normal rating, which is described as being so many amperes. The writer often wondered upon what facts this capacity rating was based. Accordingly, an experiment was tried in which a cell was subjected to an enormous current with the hope of learning what would happen when an excess of current was passed through the cell. A cell was selected which would carry 750 amperes at 3.5 volts. By means of an experimental generator, an additional current was superimposed upon the regular current, with the result that this cell carried 2,300 amperes at 4 volts. Unfortunately, the experimental generator could not be operated at a higher current, but the experiment was continued, with the result that at the end of four weeks two cells, which had been carrying 2,300 amperes for this length of time, were delivering 93 per cent of the theoretical amount of caustic soda. We naturally concluded that there was no specific rating for any cell. If power is cheap, it is obvious that it does not pay to install a large number of cells and work them at a low current. The interest and depreciation on the cells will more than offset the power which is saved by operating these cells at a low voltage, and it therefore pays to use a higher voltage and pass a higher current. The whole question was worked out very carefully, numerous curves were drawn, and it was found that a minimum cost could be easily ascertained when local conditions were considered.

FEEDING DEVICE FOR SUPPLYING BRINE.

Another phase of the subject is the method of supplying brine to a cell. A successful feeding device must be one which has in it several important features. In the first place, it must be fool-proof and require practically no attention when once started. It must maintain the level in the cell automatically, so as to keep conditions constant. It must be totally enclosed, so that no evaporation of brine will cause salt to crystallise in the feeding device. It must also have no constriction, nor can it be made to operate by means of a small aperture, for in any such device a particle of dirt, salt, or even an air bubble will cause it to fluctuate in the quantity of brine delivered. It must be cheap to construct. It must not allow any electrical current to flow through the brine being fed to the cell, because this to some extent grounds each cell and causes "electrolysis" in the pipe lines and other metallic parts of a plant. Bearing all of these things in mind, a feed was devised which delivers a broken stream through an enclosed piece of apparatus, in which there is no throttling effect and the quantity of brine delivered is controlled by the level in the cell itself. It consists in passing the brine through a chamber of gas. The gas in the chamber is held under a certain pressure due to the level of the brine in the cell, and this pressure regulates the brine being admitted to the chamber.

PROBLEM OF ELECTRODES.

A very interesting experiment was made in connection with the preservation of graphite anodes. The first idea was to fill the pores of an anode with an inert material which would prevent the current from detaching particles of graphite. In this way the anode would have a much longer "life" than without this treatment. The graphites were first impregnated with various oils. It was soon found that the excess of oil in the pores of the graphite was discharged and floated on the surface of the brine, then chlorinated, forming a wax. This prevented the chlorine from escaping from the cell, and caused trouble.

A method was devised in which the inside of each pore in the graphite was painted with an inert liquid, in such a way that the wall of the pore only would be covered. There was no excess of oil to be discharged from the graphite after it had once been treated. After this problem was solved, almost every kind of oil was tested. Not only the common oils, but such material as vulcanised oils and mixtures with asphalt and pitch were used. A good selection was finally made and thoroughly tried out. The question of impregnation resolved itself into one involving the cost of power. It seems that impregnation not only saves graphite by making the inner surface of the pores resistant to the chlorine, but it also presents a smaller surface for the electricity in passing from the anode. The increase in the current density on the graphite is shown by an increased terminal voltage of the cells, with the result that an anode which has been impregnated requires more power per ton of product than a cell in which the anodes have not been impregnated. The problem becomes one of choosing whether the cost of impregnation plus the cost of power is cheaper than the cost of graphite. Where power is cheap, it pays to impregnate.

NEW ISSUE.—Electro Bleach and By-Products, Ltd., Middlewich, Cheshire, are making an issue of 80,000 preference shares of £1. each and 80,000 ordinary shares of 10s. each. The subscription list will close on or before December 17.

ANILINE SALT—THE HYDROCHLORIDE.

ITS MINUTE MODIFICATIONS.

BY JAMES SCOTT.

ANILINE SALT is one of the most important and useful coal-tar substances devoted to the manufacture of dyestuffs and their fundamental intermediates; for which it is produced on a very extensive scale. The term "aniline salt" generally indicates the hydrochloride of aniline, although the nitrate and sulphate have also been made. But in speaking of these two last-mentioned materials reference is generally made direct to their names.

The formula for aniline salt—the hydrochloride, which alone will be hereafter meant—is $C_6H_5NH_2Cl$. The process by which it is most commonly prepared at the present time is as follows: From 130 to 135 parts of pure commercial hydrochloric acid are very slowly added to 100 parts of aniline. The mixture has to be vigorously agitated meantime, and evolves a considerable amount of heat and fumes. To ensure safety and as steady a

distilled entirely unchanged in composition. When exposed to the air for a sufficient length of time it becomes tinged with a greyish-green colour.

I propose to describe the principal microscopical characteristics of this valuable salt. As already stated, aniline salt occurs as flaky pieces. To the naked eye these particles present no structural features that can be referred to by any definite name, but upon being magnified there is disclosed to view a very systematic crystallisation of the kind depicted in Fig. 1. The substance can be rendered transparent for observation by passing the light up through it, with the exception of areas which are more highly refractive than the others, and therefore appear to be dark and opaque.

Long bars cross one another internally, and give patterns resembling rhombs and squares. Scattered densely throughout the crystals are smaller ones of less well-marked forms, besides mere wavy lines representative of wrinkling during solidification of the substance. A few number of minute shapely crystals are dispersed among the others. Fairly large angular

Fig. 1.—One twenty-fourth inch portion of aniline salt—the hydrochloride—in its ordinary condition; magnified.

Fig. 2.—One twenty-fourth inch of a sublimed layer of aniline salt—the hydrochloride—magnified.

Fig. 3.—One twenty-fourth inch of a layer of aniline salt—the hydrochloride—after dissolving in, and evaporation of, absolute alcohol; magnified.

reaction as possible, the pipe through which the hydrochloric acid passes must dip below the surface of the aniline, and, of course, be kept there constantly during the process.

Owing to the severely corrosive tendencies of the respective substances, stoneware or enamelled iron vessels have to be used in connection with the production of this salt. The agitator must be composed of the same material as that of the receptacles. When timber has been used for this purpose it has imparted an undesirable yellow tinge to the salt, which undoubtedly interferes with the subsequent treatment of the product.

After the contents of the vessel have been cooled, the salt is filtered off and whizzed in a hydro-extractor lined with vulcanite, and is finally dried on flat or enamelled trays at a temperature of $50^{\circ}C$, which appears to suit it best.

Aniline salt is distributed in the form of small, irregular wafer-like scraps, the flatness of which is accounted for by the preceding description relative to the drying treatment. It is in colour a greyish, glistening white and has a melting point of $192^{\circ}C$. It is very soluble in water, and the solution thus obtained reddens blue litmus. The acidity is not very strong, and appears to vary slightly in different makes or grades. It can be

granules—speaking in a comparative sense—adhere to the others at odd intervals, and can be easily picked off with the help of the point of a very fine needle, or something still more suitable. The formation can be seen to more advantage by adding a little water to the salt and thus dissolving off minute surface crusts. In this way, if observation is undertaken during the disappearance of the salt, many of the crystals—prismatic, feathery, and raphidic—will be detected breaking away from the remainder, and floating off into the surrounding fluid. The whole spectacle becomes remarkably clear and distinct.

Upon heating some aniline salt in a subliming cell its preliminary vapour subsides on the upper glass in the shape of very minute white specks, discs, and perfect hexagons. So closely set together are these figures that they constitute a kind of mosaic film. Continued heating causes additional vapour of aniline salt to sublime upon the first layers as much larger, variously modified, objects, a delineation of the most striking ones of which is given in Fig. 2. They are bladed, and range from geometrical plates to feathered, arborescent, and dendritic conglomerations, and stand elevated upon the glass, some being almost upright, others at various angles. Collectively they present a very curious

imitation of fungus growth. An examination of the salt still left on the lower glass will disclose the presence of crystals similar to the completely sublimed ones, lying among depressions occasioned by the disruptive influence of heat. They fringe the borders of the nodules in a very picturesque manner.

It is advisable, in order to obtain the best possible spectacles, to illuminate the sublimed salt from more than one direction; otherwise (but not always for a certainty) one may see only a sparkling mass, devoid of the symmetrical structure which actually exists. This fact is due to the surface of the crystals being coated with numbers of mere specks and flutings.

A very good practice for subliming is to lay a pinch of the salt in a long, narrow test-tube furnished with a wire ring with extended loop round it, so that by clasping it in a pair of pincers the whole may be held over a lighted lamp, or in a spirit flame. Sublimed material gets arranged along the inside of the tube in every available grade.

An exceedingly beautiful formation is obtainable by treating aniline salt with absolute alcohol. It does not really matter much whether the salt is dissolved in a test-tube containing the spirit—and then poured out and exposed to the air,—or is held on a glass slide while the solvent is poured over it. Personally, I prefer the latter method, and in undertaking it I leave an excess of salt so that many phases of crystallisation can be secured.

Fig. 3 shows a typical result of dissolving aniline salt in absolute alcohol. The crystals are modified within a few seconds, and it is very interesting to watch the changes through the microscope meantime. The mobile, swirling, alcohol washes the salt down to invisibility, and then spreads with it as a film, from which rapidly arises, during evaporation of the solvent, clusters of bold, triangular, trihedral, and kindred shimmering objects. The observer can trace the genesis of the crystal shapes from the merest, faintest rows of ridges—indicative of laminations—right up to the perfect specimens. Interstices between the more regular ones may happen to become occupied with less regular substance. In some parts of the layer we can see arrangements of scattered, flat, very minute triangular crystals, they themselves evidently lying in similarly shaped larger outlines.

Effects of a like nature can be obtained by dissolving the aniline salt in water; but then, one has to wait longer for them, and they are not so attractive, nor quite so well-shaped as the alcoholic yields.

It is not pretended that this particular article upon the subject of aniline salt has much practical value, but it is capable of surprising people who do not customarily use the microscope for investigating the structure of chemical products. We hear, and read, so much about the disposition, shifting, combination, and so on, of so-called atoms and molecules in connection with the manufacture of dyestuffs and their associated substances that it is advisable occasionally to show how difficult it becomes to prove any special hypothesis. Non-technical men wrongly believe that atoms and molecules are observable details, and that every formula given is based on ascertainable *minute* data. Microscopists, however, are fully aware of the truth, and the difficulties of ensuring that statements bearing on atomic and molecular re-arrangements are absolutely correct.

When one watches the ever-changing commotions which go on in a magnified space actually no wider than

one of the full-stops on this page, one realises the necessity for being careful in regard to theories promulgated along chemical lines. It is not always a case—as is generally supposed—of arguing from the atom or molecule to bulk; but *vice versa*, ideas relative to bulk, theoretically sub-divided, being applied to cover imaginary atoms and molecules, which, after all, may turn out to be the effects of electrical ionisation, and not the creative members many scientists take them to be.

At any rate, seeing that the subject of dyestuffs is a blending of practical methods and unusually complex theories, microscopical observations on the substances involved may be worth more attention than they have received.

CHEMICAL EMPLOYERS AND SHIFT-WORKERS' WAGES.

THE Chemical Employers' Federation have prepared a memorandum on the report of the employers' representatives on the Shift Inquiry Committee. They remark that they are impressed by three particular features of the report. One of these is that the evidence of unrest was submitted in the main by trade-union officials, and was not in any single instance corroborated by the employers, whose experience was that their workmen have not exhibited signs of unrest and discontent. The second feature is that the reductions in earnings of which complaint was made to the Shift Inquiry Committee were the direct and logical result of a national agreement between the men's unions and their employers. The Chemical Employers' Federation feel that the workmen concerned have no reasonable ground for complaint, and should loyally abide by the agreement made on their behalf. The third point is that the claim for a shorter working week for shiftmen, or, alternatively, that a cash advance be conceded to these men, was put forward in accordance with the usual rule that a concession made to one class of workmen must be extended to all.

The present position, the Federation state, is that, on the average, day labourers have received advances amounting to 176 per cent. and shiftmen 160.7 per cent. over pre-war rates; whereas the cost of living is given as being 125 per cent. in excess of pre-war. Chemical manufacturers feel, therefore, that these figures discount entirely the grievance in regard to the conversion of 12 to 8 hour shifts. The proposal of the unions for minimum rates of 1s. 6d. and 1s. 8d. would impose an impossible burden on the great majority of manufacturers and certainly create unemployment. Further, the chemical trade has been endeavouring to ascertain what are likely to be its commitments under the Hours of Employment Bill, but so far has failed to do so. It may be that each manufacturer will be obliged to employ one-sixth additional shiftmen in order to reduce the present shiftmen's hours to 48, and this means very serious additional expenditure. Having regard, therefore, to all the circumstances, the Chemical Employers' Federation cannot agree to any further advance in wages as proposed by the union representatives on the Shift Inquiry Committee.

PACIFIC PHOSPHATE COMPANY, LTD.—Interim dividend on ordinary in respect of the half-year to June 30 at the rate of 5 per cent. per annum.

THE OIL-SEED CRUSHING INDUSTRY.

A PAPER on this subject which was read at the Royal Society of Arts, on December 3, by Mr. J. W. Pearson, chairman and managing director of the British Oil and Cake Mills Ltd., gave an admirable review of the present position of the industry, as well as an insight into its history. Brief reference to the paper was made in our last issue.

After explaining how for a long time, the industry was centred mostly at the ports of London, Hull, and Liverpool, he gave a list of places where oil mills are now to be found, adding that at the outbreak of war, there were sixty different firms engaged in the trade ranging in importance from small country owners with a mill capacity of 5,000 tons of seed per annum to the establishments of his company, which handled something like 45 per cent. of the entire industry. In connection with the development of the oil-seed crushing industry, he mentioned the fact that the importance of keeping the oil-seed factories fully at work was first called attention to by the firms engaged in the soap trade, who pointed out that the supply of glycerine for the manufacture of explosives was dependent upon the maintenance of adequate supplies of oils for soap manufacture. It was for that reason that the trade was first included in the group of controlled trades under the Ministry of Munitions. Later on, when the importance of the trade for the manufacture of margarine was recognised, the control was transferred to the Ministry of Food.

The paper then described how in the past oil seed crushers in the country have used only the poorer oil bearing seeds, as the main object in view was to produce cattle feeding cake, leaving those rich in oil to be acquired by Continental countries, who always made greater use of these oils for edible purposes than we did prior to the war. We all know now, how under compulsion, the British people have been compelled to eat margarine to an extent not dreamed of five years ago, and at the present time British plants are capable of producing 10,000 tons of margarine per week, whereas no more than 2,000 tons were produced before the war. The seeds rich in oil were classified as ground nuts, sesame, castor, mowrah, copra, and palm kernels, whilst the group less rich in oil—containing less than 45 per cent.—comprises linseed, cotton seed, niger seed, poppy seed, rape seed and soya. Notwithstanding that the majority of the oil-seed crops of the world are produced within the British Empire, it is the fact that we in England, before the war used only the last-named series. The effect of the use of richer oil-bearing seeds for edible purposes, had been that soap-makers and others had had to find substitutes for the oil now used for margarine. In years to come, the author anticipated that means would be found to use such other seeds as cohune, coquilla, cognita nuts, and the many hundred seeds which at present were not suitable for cracking and effective separations.

The history of the development of oil crushing plant was gone into with some detail from the original breaking plant—the horizontal stone—used for the olive, to the modern hydraulic press now commonly used, and found to be conveniently adapted for the treatment of the group of seeds of the lower oil-bearing variety. The cage press, particularly adapted for the treatment of the richer oil-bearing seeds, was also referred to, and in a tone of regret, it was stated that no system has yet been discovered which will enable the whole process of oil manufacture to be conducted automatically from the cooling-

kettle to the point of oil expression; this was the stage where there is much scope for development in manufacture.

Attention was next called to the chemical extraction process which has come much more into favour in recent years. The preliminary treatment plant for breaking or crushing the material is similar to that adopted in hydraulic mills, but the crushed material is thereafter transferred to large pots or extractors, where it is subjected to the action of a chemical solvent, the ordinary forms of which are petroleum ether, carbon bisulphide, carbon tetrachloride, and trichlorethylene. The first is in more general use, while all have certain advantages and disadvantages. In this process the residue is left in the form of meal and not in the form of cake, and one of the principal drawbacks is the difficulty of getting rid entirely of all traces of the solvent both in the meal residue and in the oil product. The process is in much more general use in North Europe than in England, because the farmers there are more accustomed to use feeding-stuffs in the form of meal, while in England the whole cake, bearing a brand, is generally preferred. In the oil there is frequently found a faint aroma from the solvent which is difficult to remove entirely in the process of refining. For a long time oil obtained by the extraction process was regarded as unsuitable for edible purposes, but improvements in the manufacture and purity of the solvent, and also in refining processes, now enable the oil to be used by almost all the edible trades.

The author is using the latter process side by side with the hydraulic process and reckons that the cost of working is about 50 per cent. greater in the case of the extraction process.

We will not follow the author through his detailed description of the five operations involved in oil seed crushing, viz., cleaning, rolling, cooking, pressing and paring. After mentioning the possibilities of cotton-seed oil and describing how all the ingredients are now made use of instead of being wasted, attention was given to what the author described as the most interesting process of recent date, viz., the hardening or hydrogenating process which enables most liquid oils to be turned into a solid substance almost indistinguishable from tallow, and relies in its operation upon a purely chemical change. All liquid oils contain a large proportion of unsaturated fatty acids, usually described as oleic, which by the absorption of two extra atoms of hydrogen are capable of conversion into stearic acid. While the unsaturated oleic acids retain the physical form of liquids, the saturated stearic acids containing their full complement of hydrogen have the form of solid waxes or tallows. The hydrogenating process is the result of an invention based upon a discovery of a system under which it was possible to introduce the necessary additional hydrogen to complete saturation. The plant is not dissimilar to that used in the deodorising and refining process, but in this case the neutralised oil, instead of being subjected to the operation of a passage of superheated steam, is exposed to a stream of heated hydrogen gas in the presence of a catalyst.

The catalyst was a perfectly neutral body, whose mere presence facilitated the absorption by oleic acids of the extra hydrogen necessary to complete saturation, and without which no action takes place. The catalyst usually employed was very finely divided nickel. He doubted whether the exact action of the catalyst was yet clearly understood, because at the end of the process it apparently remained in exactly the same condition as at the commencement, subject only to a gradual loss of

efficiency through oxidisation. Several large plants had been erected in England and in North Europe for the treatment of oil by the hydrogenating process, and the general effect was to enable liquid oils to be used by either soap makers or margarine makers in place of hard oils. He hoped that the manufacture of edible oils, being so largely the product of raw materials grown in our own Colonies, would be retained as a permanent trade for the United Kingdom.

Finally the paper dealt with the production of oil cake, more especially with cottonseed oil cake, a description being given of the difference in the treatment of cotton seed in this country and America. [The process of decortication as practised in America, by which the kernel is taken from the shell before crushing, was dealt with before the London Section of the Society of Chemical Industry last session by Mr. E. C. de Segundo and was dealt with at the time in the *Chemical Trade Journal and Chemical Engineer*.]

The discussion centred almost entirely upon the production of oil cake for cattle feeding. Mr. E. C. de Segundo again dealt with the cotton seed and exhibited a number of rolls made of cottonseed flour, which are said to be valuable in the treatment of diabetes. Our representative was presented with a few and found them not distasteful, but as he is credited with having a palate past praying for we hope this will not be taken as a recommendation or otherwise of bread made from cottonseed flour.

Mr. D. T. Chadwick, the Indian Trade Commissioner in London, reminded us how in the past the richer oil-bearing seeds of Southern India especially were sold in foreign markets. The author had explained the reason for that, and added later that it was a position which was being remedied.

Dr. J. A. Volcker doubted whether the change over of the English crushers to producing oil was altogether in favour of the farmers, because it meant they were getting a cake with a lower percentage of oil in it, which was not good for the cattle.

Mr. H. J. Pooley said his experience of the extraction process showed that there was 2s. 6d. per ton in working cost in its favour.

Mr. Lloyd, the consulting chemist to the British Dairy Farmers' Association, regretted the tendency to extract the last drop of oil out of the seed, because that meant a larger percentage of albumenoids, which the animals could not digest. What was wanted was a softer cake with a larger percentage of oil.

Mr. McIlwaine, of the Hull Oil Company, said that the so-called chemical process of extracting oil was a physical one. Whilst before the war he had been unable to sell farmers any castor oil seed cake, he was now disposing of it in increasing quantities. One of the reasons why this country had been backward in the crushing of seed for edible oils was that before the war the German Government put a tax of £10. per ton upon palm kernel and other seeds going into Germany, and the result was that the unfortunate people in Germany had to pay £10. per ton too much for the oil they consumed in the interest of the export trade. Without that tax, English crushers would have been able to compete.

Mr. Pearson briefly replied to the discussion, and laid stress upon the necessity for some means of ensuring the purity of cake supplied to farmers. He doubted whether much of the so-called decorticated cotton seed cake was decorticated, and in that case the farmer was paying a high price for an inferior article.

CATALYTIC ACTIONS AT SOLID SURFACES.

A PAPER by Dr. E. F. Armstrong and Mr. T. P. Hilditch, entitled "A Study of Catalytic Actions at Solid Surfaces, Part II.," was communicated by Professor H. E. Armstrong, F.R.S., at a meeting of the Royal Society on Thursday of last week.

It was shown that the catalytic action of metals, like that of certain enzymes, is reversible; in other words, compounds which are saturated in the ordinary sense are capable of interacting with the metal to form a system which breaks down into a more stable equilibrium consisting of hydrogen and a less saturated compound. This was readily demonstrated in the case of cyclohexanol: when a mixture of cyclohexanol and methyl cinnamate is heated at 180° in presence of nickel a considerable transference into cyclohexanone and methyl β -phenyl propionate is effected. It is necessary that both components of the system should be present in the liquid state. Dehydrogenation has also been effected in the case of hexahydroxylene and dihydropinene mixed with methyl cinnamate in presence of nickel: in these cases a temperature of 230° is required. At this temperature small quantities of an ethyl oleate of unknown structure are obtained from ethyl stearate.

The authors' theories of catalytic hydrogenation and dehydrogenation in the liquid state afford some explanation of the products obtained during the hydrogenation of unsaturated glycerides. Moore (*J. Soc. Chem. Ind.*, 1919) has shown that partial hydrogenation of ethyl oleate causes formation of ethyl stearate, and also of ethyl esters of isomeric forms of ordinary oleic acid, most probably ethyl elaidate and an ethyl "iso-oleate" derived from $\Delta^{11,12}$ oleic acid. The appearance of the elaidic ester, the stereo-isomeric form of ordinary oleic ester, was readily explained by the assumed equilibrated action between catalytic nickel and the ethylenic linkage, for on reformation of constituents during balanced action it is plain that either or both stereo-isomeric ethylenic derivatives might result.

SYNTHETIC AMMONIA.

THE Paris correspondent of *The Times*, in a message to that journal, says: "Professor d'Arsonval has made an important communication in the name of M. Georges Claude to the Academy of Science. M. Claude recently showed that contrary to the generally received theory it was not only possible but strikingly easy to produce and turn to industrial uses pressures of 1,000 atmospheres and more. M. Claude has now succeeded in applying these very high pressures to the synthetic production of ammonia. Hitherto this had been done and applied only in Germany. M. Claude, however, has far outdistanced the German chemists. Under the new conditions discovered by him the combination of hydrogen and nitrogen takes place with such intensity that a very small apparatus is capable of a considerable output. M. Claude proposes shortly to exhibit to the members of the Academy a tiny apparatus in regular working order, capable of producing daily 200 litres (44 gallons) of liquid ammonia. Whereas the German chemist Haber obtains only one-third of a gramme of ammonia per catalytic gramme, M. Claude obtains ten grammes

SOCIETY OF CHEMICAL INDUSTRY.

MANCHESTER SECTION.

A MEETING of the Manchester Section of the Society of Chemical Industry was held on Friday (December 5), Mr. John Allan, chairman of the Section, presiding. Before the commencement of the usual proceedings, the Chairman referred to the death of Dr. Grossmann, an original member of the Society and a member of the Manchester Section, and it was resolved that a message of condolence from the Section should be forwarded to Mrs. Grossmann. Mr. Allan also drew attention to the revival of the annual dinner, to be held at the Grand Hotel, Manchester, on January 22 next.

A paper was read by Dr. E. Ardern on

"THE ACTIVATED SLUDGE PROCESS OF SEWAGE PURIFICATION."

Dr. Ardern, in continuation of previous communications before the Society, gave an account of a continuous flow unit for the treatment of sewage which was installed by the Manchester Corporation at their Withington works about two years ago. The plant was designed to treat daily about 250,000 gallons of sewage, with an average aeration period of four hours. No difficulty, said the author, had been met with in connection with the use of the diffusers—300 of which had been in use during the past two years—or in the distribution of the diffused air employed. The sewage treated at the Withington works is a weak domestic type, and the consumption of air varied from about 0.8 to 1.5 cubic foot per gallon of sewage treated. In the works in question it was stated that the air consumption, compressed to 3.11b., need not exceed an average of 1.0 cubic foot per gallon if a high degree of nitrification was not required. The sludge production, apart from detritus tank sludge, was equivalent to 0.6 ton of dry matter per million gallons of sewage treated.

The treated sludge, said the author, contained nitrogen to the extent of 6.5 per cent., and also an appreciable amount of phosphate. He had the advantage of assistance from Dr. Russell, of the Rothamsted Experimental Station, and under his guidance an acre of land was marked out into 45 different plots in order to investigate the fertilising value of the sludge. The land was rather loamy and on the heavy side. The results obtained were very encouraging. Summarising the two years' experience with the plant, it could be said very definitely that the process had undoubtedly been demonstrated to be a practicable one. The capital outlay involved in the installation of plant of the character described was very considerably less than was required for the installation of the usual tank and filter plant. In large works situated in large industrial centres it was necessary, however, to evolve a method of dewatering prior to drying. The Americans reckoned to have solved the problem, but we were not yet in that position in this country. A number of slides were shown giving an indication of developments that are taking place in other parts of the country.

A long discussion ensued, in which Mr. Allan, Major Ross, Miss Robinson, and Messrs. Thompson, H. N. Morris, and Drummond Paton took part.

Mr. Allan said that the diffusers which the author had stated had been found to work very satisfactorily with sewage might be found extremely useful in various branches of the chemical industry for the distribution of air and gases. The Chairman also stated that the use

of sewage sludge for manurial purposes depended upon its production in a form which rendered its carriage easy to where it was intended to be used.

Mr. W. Thompson asked if the methods used in the treatment of peat had been applied to the extraction of water from sewage sludge.

Mr. H. N. Morris suggested the use of a continuous acting centrifugal apparatus for this purpose.

Miss Robinson drew attention to the clogging of agricultural land near London as the result of the continued use of sludge as a fertiliser.

Dr. Ardern replied that, in order to bring the nitrogen content of activated sludge equal to that of sulphate of ammonia, about four times the weight of the former was necessary. Attempts had been made to reduce the water-content of sludge by means similar to those adopted in the treatment of peat, but with what measure of success Dr. Ardern did not make quite clear. Use had also been made of a continuous acting centrifugal, but the results had not been altogether satisfactory. Regarding the clogging of land owing to the cumulative effects of the application of sewage sludge as a fertiliser, this was probably because of the high content of grease. Activated sludge differed from ordinary sludge, inasmuch as the latter contained grease varying from 30 to 40 per cent., and that would, naturally, in time, interfere with the soil. The highest grease content of activated sludge was about 9 per cent., and they had had it as low as 3 per cent.

Captain F. S. Sinnatt, M.B.E., then read a paper, the joint work of himself and Mr. Burrows Moore, on

"A METHOD OF DETERMINING THE RELATIVE TEMPERATURES OF SPONTANEOUS IGNITION OF COALS."

In introducing this paper the authors acknowledged their indebtedness to Mr. Harold Moore, who had designed the apparatus which they were using in their work. The subject of the paper, Captain Sinnatt said, was one that had not been dealt with very frequently, and the paper was brought forward in the hope that suggestions might be forthcoming which would assist them in the work. The real reason why the work was started was because pulverised fuel was coming to the front very rapidly, and there appeared to be very little information as to the way in which that type of fuel would ignite. Describing the method briefly, the author said that a small weight of coal was heated in a nickel crucible, of a capacity of about 10cc., which was maintained at a series of constant temperatures, a record being kept of the time at which glowing in the coal first occurred and also the time of spontaneous ignition. The time of glow was fairly regular. In the case of the ignition curve, on the other hand, there were temperate zones at which ignition occurred with greater difficulty. The temperature-time curve relating to the occurrences of glow was put forward as the one which should be used for classifying the different classes of coal. It was concluded that the degree of fineness influenced very considerably the glow temperature, the tendency being for the glow temperature of fine and coarse mixtures to approach the temperature at which the finest material glowed. It was hoped that the work would serve the useful purpose of affording some indication as to suitability of coals for storing.

Mr. Allan, in the course of the discussion, said the subject of the paper was one of considerable interest to those who were concerned with coal dust firing, in that many of the systems which were using coal dust were also

using preliminarily heated air. Precautions might have to be taken with certain coals to keep down the preliminary ignition if the air was preliminarily heated above the combustion limit.

MICROSCOPE COMBINATION.

Before the commencement of the meeting, Mr. F. Davidson demonstrated and explained the "Davon" microscope combination. The apparatus is unique in combining, in standardised and instantly interchangeable form, the functions of the microscope, telescope, camera, and projecting lantern for laboratory, educational, and general industrial purposes.

HIGH EXPLOSIVES.

PROFESSOR H. B. DIXON, of the University of Manchester, lecturing upon "High Explosives in Theory and Practice" at the Midland Institute, Birmingham, on Monday, said the use of high explosives in warfare, except in the form of detonating caps, had been introduced during the present generation. High explosives were known, but their instability and the danger of handling them prohibited their use. Gun-cotton was the first to be chemically studied and brought under control, but its use was chiefly confined to mines, torpedoes, and to bursting-charges for demolition. Picric acid—lyddite in England, melinite in France—was the first to be used in shells; but it was expensive to make and not free from danger. Both those high explosives would burn rapidly in the open, would deflagrate without explosion, but when burnt in a confined space or when ignited by a shock would explode with extreme rapidity and violence. The chemical mechanism producing those different results had only been made out by the study of gaseous explosions—a study initiated by English chemists—Priestley, Cavendish, and Davy—more than 100 years ago, and then curiously neglected, like other English discoveries, in this country, but taken up by Bunsen in Germany and by Berthelot and Le Chatelier in France.

Forty years ago, said the lecturer, our ideas on the explosion of gases were dominated by three conclusions laid down by Bunsen. The first was that the flame travelled slowly, and in the fastest known mixture it only had a velocity of some thirty yards a second; the second was that where the flame spread there combustion was complete; and the third was that the explosion was not a single act of combustion, but took place in three stages, with intervals of non-burning in between. None of those conclusions explained the processes of deflagration and detonation, and the first and third were difficult to reconcile with observed facts. All three, in fact, were wrong. Berthelot in 1881 was the first to announce the discovery of the explosion-wave in gases, to measure its velocity in a number of different gas mixtures, and to compare it with the rates of movement of the gas molecules themselves at the moment of their formation.

Le Chatelier had made many interesting experiments on the progress of gaseous explosions, which he had divided into three parts according to the motions of (1) a uniform slow movement of the flame, (2) a vibratory period with rapid changes of rate, and (3) very rapid motion, which constitutes the "explosion-wave." It was the explosion-wave itself which he, personally, had studied with a view to explaining it according to the molecular theory, and at the same time to explain the

detonation of all high explosives. The most complete interpretation and the results obtained had been furnished independently by one of his former assistants, Mr. D. L. Chapman, of Oxford, and by Professor Jougné, of Paris. They had shown, theoretically, that the burning gas in the wave-front was shot forward with the velocity of sound, and the explosion-wave travelled forward with that moving gas, also with the velocity of sound, so that the real forward motion had twice the velocity of sound with the burning gases.

It was possible to photograph the explosion-wave on a rapidly-moving film so as to analyse its movements and the effect of the pressure waves upon it, and that it was really travelling with the velocity of sound could be demonstrated by starting a sound-wave behind the wave-front and showing photographically that they kept pace with one another. The high explosive for war must give complete detonation when once the explosion-wave is started, but it must not be sensitive to ordinary jars or vibrations; it must not be liable to change either in itself or in contact with the metal holding it. The high explosive Britain made use of in the war—tri-nitro-toluene—had never been made in quantity in England before. Its pulverising power, too powerful for many purposes, was diluted down with ammonium nitrate; and the mixture amatol became in the end the standard high explosive, though other mixtures were used sometimes with metallic powders where large flames were needed.

SOCIETY OF DYERS AND COLOURISTS.

WEST RIDING SECTION.

AT a meeting of the West Riding Section of the Society of Dyers and Colourists, held at the Hotel Metro-pole, Leeds, Professor T. J. Hewitt, F.R.S., gave a lecture on "Non-Aromatic Intermediates in Dye Manufacture." Many members of the Society of Chemical Industry were also present.

Mr. John C. Oxley, the chairman, explained that that was the first meeting of the Society which had been held in Leeds, and it had been arranged as an experiment to bring their work before their members in that district.

Professor Hewitt gave an exhaustive lecture covering the work which had been done up to date, including a review of the methods and patents emanating from other countries. He also dealt with the aliphatic compounds used in dye manufacture, such as methylated alcohol, succinic acid, aldehydes, acetone, and phosgene, used in the manufacture of such dyestuffs as rhodamin S., tartrazene, and indigo.

Following an interesting discussion, Professor A. G. Perkin moved a vote of thanks to the lecturer, and said that when the war broke out they had found that they had only three or four able chemists who could be considered as leaders in the colour industry, and of those Dr. Hewitt was one. Unless they could increase the number of such experts in the future, they could not hope to wrest from Germany her superiority in that sphere, and, consequently, there must be a larger number of young men devoting themselves to research work. Of all the branches of chemistry, organic chemistry had been the least fashionable in this country during the last 20 years.

Mr. G. H. Frank seconded the vote of thanks, which was carried unanimously.

CENTRIFUGAL EXTRACTION.

AN interesting lecture on "Centrifugal Extractors and Separators" was given by Mr. E. A. Alliot at the College of Technology, Manchester, on Tuesday. After explaining the functions of centrifugal apparatus and their industrial applications, the lecturer stated that in an ordinary large type of extractor the force exerted on a drop of water or other liquid contained in the machine would be between 400 and 600 times the weight of the liquid, the basket attaining a speed of over 100 miles per hour. In special separators of very small size a force could be exerted up to as much as 40,000 times the weight of any particles on the rim of the machine.

The lecturer proceeded to describe the construction of a typical centrifugal. A steel or copper plate basket, suitably perforated to admit of the escape of the liquid, is supported on a dome carried by the top of a revolving spindle. In the particular machine referred to the dry material is discharged from the basket through holes, an opening being provided also in the pan above which the holes are brought. The holes are covered by hinged doors while the machine is in operation. The liquid draining from the basket is collected in the outer pan, a spout being provided to allow the liquid to run off. To permit of the basket being withdrawn from the machine the top ring of the pan can be lifted off.

The baskets are, preferably, made of steel or other plates, and where materials difficult to drain are being dealt with the inside of the basket is often fitted with wire gauze—first, a coarse gauze next to the plate so as to allow the liquid to get freely to the holes, and over this a finer gauze to prevent the escape of small crystals. In some cases, where very fine material is under treatment, a filter cloth is also used. Besides being made in steel plate or wire, in which case they are usually galvanised, baskets may be constructed in copper or aluminium, or covered with vulcanite to withstand the action of weak acids. A covering of homogeneous lead is also sometimes applied, or occasionally porcelain liners fitted inside the baskets.

Mr. Alliot considered in detail, with the aid of a series of lantern slides, the principal features of a number of centrifugals, and showed curves depicting the power requirements for electrically driven centrifugals of different sizes. For a 26in. diameter centrifugal, about 3H.P. is required to start the machine and $1\frac{3}{4}$ H.P. to run it; for a 36in. machine, $4\frac{1}{2}$ H.P. and $2\frac{1}{2}$ H.P.; and for a 60in. machine, 15H.P. and 7H.P. The theory of the rim speeds and the extractive powers of centrifugal machines was then gone into at some length. A simple device for preventing vibration when machines are in operation, consisting of suspending the whole of the machine on four rods carried by pillars, was also described. This arrangement is applied with advantage to a bottom-discharge machine, raised on pillars to a convenient height for emptying into a truck or barrel placed below the discharge chute. Such a type was said to be extremely useful for dealing with such crystals as nitrate and sulphate of ammonia and Epsom salts.

Referring to the capacities of centrifugals, Mr. Alliot said that in dealing with liquid slurries the charge should be something under the net cubic content below the basket rim or lip. For more solid materials, the capacity will be a little greater, as their angle of repose enables them to pile up without flying about. Sulphate of ammonia, for example, will pile up over the lip to a very considerable extent. Very rarely, however, is the

basket filled to the extent of its gross capacity. A 36in. machine would take a charge of about 2cwt. of Epsom salts (dry weight), and, using bottom discharge doors, six charges per hour would quite easily be obtained. Caustic lime, however, is more difficult to deal with, as it cakes very firmly against the side of the basket and is not easily persuaded to break up. Two charges per hour in ordinary-sized machines would be tolerable, whilst if the conditions were less favourable one charge might take three-quarters of an hour. For a 40in. self-balancing, under-driven machine the usual charge was about 5cwt., the time for each charge varying according to arrangements.

Most fine crystals will retain 3 to 4 per cent. of water after treatment in a centrifugal, larger crystals about 1.5 per cent, and very large crystals as little as 0.5 per cent. Caustic lime will readily retain 30 per cent of moisture, or even more, as will other materials of a very fine nature. The moisture extracted was mainly external, the liquid being caught within the body of the crystals or in structural cells being more difficult of removal. A word of warning was given against running machines at their highest-rated speeds, as solid matter may be thrown so heavily against the side of the pan as to interfere with the escape of the liquid.

The lecturer also dealt with continuous operating centrifugals. There were many difficulties, he said, to be overcome in connection with these; for instance, very heavy pressure on the working parts, abrasion by gritty materials, and the difficulty of getting loads in balance. Attempts had been made, with varying success, to surmount these.

SOCIETY OF PUBLIC ANALYSTS.

AT an ordinary meeting of the Society of Public Analysts, held at the Chemical Society's Rooms, Burlington House, last week, Dr. Samuel Rideal, president, in the chair, the following papers were read:—

"NEW DISTILLATION METHOD FOR DETECTING ADULTERATION IN BUTTER, AND FOR ESTIMATING FATS OF THE COCOANUT GROUP."

By GEORGE VAN B. GILMOUR, B.Sc.

The method described consists in separating the volatile acids into two groups, depending on their solubility or insolubility in saturated brine (NaCl). Results were given for the application of the method to the distillate from the Blichfeldt apparatus. These results indicate that the composition of a fatty mixture deduced in this manner is more reliable and more rapidly obtained than by the combination of the Reichert-Meissl-Polenske-Kirschner method.

"A NEW PROCESS FOR THE DETERMINATION OF ARSENIC, WITH NOTES ON THE CHEMISTRY OF THE MARSH-BERZELIUS PROCESS."

By B. S. EVANS, M.C., B.Sc., F.I.C.

Arseniuretted hydrogen evolved by reduction with zinc and sulphuric acid is decomposed by ignited copper. The increased weight of copper is divided by a factor which was discussed. The necessity was shown for the absence of heavy metals. The retention of arsenic in the Marsh-Berzelius test was considered to be due to (a) metallic arsenide; (b) arsenic. The author also put forward an explanation of Chapman's modification using cadmium.

INSTITUTE OF CHEMISTRY.

LIVERPOOL SECTION.

THE first annual dinner of the Liverpool Section of the Institute of Chemistry was held at the Adelphi Hotel, Liverpool, on Friday (December 5), Sir Herbert Jackson, the president of the Institute, presiding.

Mr. John Grey proposed, "Liverpool, with Its Industries and Commerce," saying that Lancashire was the home of the heavy chemical industry, and some of the most important factories in the country were near Liverpool. As to the future of the chemical industry, we had not much to fear from Germany or the United States, the uncertain position of labour at home being what we had to fear. They must consider what could be done in the general bringing up to date of the processes employed in chemical industries.

Alderman Muirhead, in replying, said that at the present time we were at a parting of the ways, and we had either to go backward or forward. He spoke of the particular importance of motor transport in regard to trade and commerce. Motor transport was coming into its own, and he believed the railways would be left behind. There would be considerable expenditure on roads. He thought it would be a good thing to endow a chair at the University for the purpose of teaching trade-union leaders something of political economy. Production only would promote prosperity, and the limitation of production distinctly meant that we were on a downward grade. Later, Alderman Muirhead proposed "The Institute of Chemistry," saying that the co-ordination between the chemist and the engineer was an important thing for this country. The chemist was now a necessary adjunct to other trades.

Sir Herbert Jackson congratulated the Liverpool Section, the first local section to be formed and organised. There were nearly 3,000 members in the Institute, which had aimed to become the professional body, ensuring that those who belonged to it had the necessary training, and maintaining in those who practised chemistry the highest integrity and efficiency. The Institute had filled a definite place in the history of the progress of chemistry. He wished the Liverpool Section every possible prosperity.

Mr. D. Cardwell, of the Manchester Section, proposed "The Liverpool Section of the Institute."

NATIONAL ASSOCIATION OF INDUSTRIAL CHEMISTS.

NEWCASTLE SECTION.

THE annual general meeting of the Newcastle and District Section of the National Association of Industrial Chemists was held at Newcastle on Saturday last, under the chairmanship of Mr. J. S. F. Gard, B.Sc., A.I.C. The treasurer's report and financial statement were read and adopted, and the following officers were elected: Chairman, Mr. E. L. Burt, in succession to Mr. J. S. F. Gard, the retiring chairman; Mr. E. Turner was elected vice-chairman, in succession to Mr. J. Martindale, retiring; secretary, Mr. E. P. Lumley, re-elected; assistant secretary, Mr. W. M. Sowerby, re-elected; treasurer, Mr. A. R. Hord, re-elected. The following gentlemen were elected to the Council: Messrs. D. Stenhouse, W. M. Sowerby, J. W. Martindale, J. S. F. Gard, J. W. Macaulay, D. Rogers, A. Shaw, and J. B. Ridley. Mr. A. R. Hord and Mr. E. Turner were elected delegates to attend the National Council meetings.

It was decided that all meetings of the Section for the coming year should be held in the Church Institute, Newcastle, and that an annual dinner should be held, to immediately precede the annual general meeting. The first dinner is to be held early in January of next year.

A new form of H_2S apparatus, which is claimed to be both simple and efficient, was described by Messrs. S. Richardson and H. W. Keenan.

THE GLASS INDUSTRY.

IMPORTANT DEVELOPMENTS.

M R. W. BRADFORD, General Financial Secretary of the National Flint Glass Makers' Society, presiding at a meeting of the members at Dudley on Saturday last, stated that owing to the competition of foreign manufacturers, the glass trade before the war was approaching extinction.

It was frankly admitted that at present English manufacturers could not produce anything approaching the total requirements of the nation. The number of employees in the industry had, however, considerably increased, and very soon there would be a marked expansion of the output. The removal as from September last, of all restrictions on imports of table and decorative glass had had a most unfortunate effect on manufacturers. Those who had already extended their plant were unsettled, and other manufacturers who were awaiting the announcement of the Government's policy before embarking further capital were now discouraged from steps which they would otherwise have taken.

Before the war, with the exception of two firms manufacturing electric lamps, practically no electric lamp bulbs were produced in England. The development of the trade was such that now upwards of 1,000,000 bulbs per week, together with the necessary tubing and rod, were being produced and the Board of Trade had stated within the last few days that the requirements of the country were being fully met by home manufacturers. Several plants were being installed which would, if necessary, greatly increase the weekly production, and there was no doubt that manufacturers could amply meet both home requirements and the requirements of all the export trade they could secure. It would be a catastrophe if the employment which this new industry provided for some thousands of people was jeopardised by the unfair competition of foreigners receiving incomparably lower wages and working under much less satisfactory conditions.

With regard to lamp chimneys, these were before the war largely imported. At the present time English manufacturers were taking up their production in large quantities, and it was anticipated that within the next six months their production would be increased by at least 100,000 per week. In regard to scientific glassware and essential illuminating glassware, in which the industrial chemist had played a great part, both manufacturers and workers had demanded that importation should be strictly limited until time had permitted the development of productive capacity sufficient to enable them to take care of their former trade. The development of this section of the trade, which should take place very rapidly, should provide healthy and well-paid employment for considerable numbers of skilled and unskilled men and women.

LEAD AND ZINC MINING INDUSTRY.

THE Non-ferrous Mining Committee has held several meetings recently under the chairmanship of Mr. H. B. Betterton, M.P. It has now concluded hearing evidence on tin mining and has begun its inquiry into lead and zinc mining.

The views of the Lead and Zinc Mine Owners' Association were stated by Mr. Arthur L. Onslow, the chairman of the Association, and by Mr. Anthony Wilson, vice-chairman. With regard to the mines producing galena only, they said that it would be impossible, with current working costs, to work at the prices for lead ruling throughout the summer, but that they saw no difficulty in carrying on the industry at the present market price for that metal. The mines producing blende only or both blende and galena were in a less hopeful position, owing to the impossibility of disposing of their blende except at unremunerative prices. It was stated that the withdrawal of the bonus on production and the cessation of the refund of the Coal Controller's awards now made it impossible to carry on zinc mining at a profit, and these witnesses were of the opinion that with present costs the mines would be unable to pay their way with a price for 50 per cent. blende of less than £12. 10s. per ton.

Mr. Wilson complained of the heavy burdens now borne by the industry in royalties, rates, and taxes. He stated that the sliding scales for royalties, based on the price of the product, were fixed when working costs were much lower than they now are, and, consequently, there was a much greater margin between costs of production and selling price. The system of assessing for rates on the basis of the royalty charge, whether any profit were earned or not, now involved a heavy charge on the industry not only on account of the increase in the basis of assessment but also owing to the rapid rise in the rates themselves. Complaint was also made of unfair treatment by the income-tax authorities in the matter of allowances for depreciation and development work.

Mr. H. S. Willis, general manager of the Weardale Lead Co., Ltd., explained the operations of that company and described the developments it was proposed to undertake at the Boltsburn, Stanhopeburn, and Bedling Mines.

TRANSPORT AND DISTRIBUTION OF LIQUIDS.

A CONFERENCE on "The Transport and Distribution of Liquids in Chemical Works," under the auspices of the Chemical Engineering group of the Society of Chemical Industry, is to be held in the Chemical Department of Armstrong College, Newcastle-on-Tyne, on Monday next (December 15), from 3 to 5.30, and from 7.30 to 10 p.m. A provisional list of papers to be read, in abstract, and discussed is given below: "The Squeegee Positive Rotary Pump," By R. A. Pelmore, B.Sc., A.M.I.Mech.E.; "Pumping Acids and other Corrosive Liquids," by W. Hayhurst; "The Marclen Glandless Acid Pump," by R. A. Stewart; "The Handling of Petroleum in Bulk at Thames Haven," by N. A. Anfilogoff, F.I.C., M.I.Mech.E., F.C.S.; "Pumping Acid with Compressed Air," by John Oliphant; "General Types of Pumping Machinery used in Chemical Works," by J. H. West, B.Sc.; "The Elevation of Acids by the Kestner Patent Automatic Elevator," by J. Arthur Reavell,

M.I.Mech.E. The papers will be illustrated by diagrams, lantern slides and models, and will give the latest information and practice in connection with the machinery described. An exhibition of novel and modern pumping devices will be shown by Guthrie and Co., Accrington; Marclen Pumps, Ltd., London; the Avamere Engineering Company, Ltd., London; and other firms.

TEST OF BENZOLE AS MOTOR FUEL.

THE Automobile Association and Motor Union have issued a preliminary report of the 10,000 miles road test undertaken to prove whether benzole conforming to the Association's specification does or does not injure the engine or any other part of the car. The test began on August 28, and was completed on November 5, the number of days on which the car was running being 62 and the actual mileage covered being 10,000.45 miles. The following results were obtained: (1) Total number of gallons used during the test, 406 gallons 7 pints; (2) average mean weight of car, 1.8 tons; (3) average miles per gallon, 24.57 miles; (4) average ton miles per gallon, 44.22; (5) total amount of lubricating oil burnt, 5 gallons 6 pints; (6) average number of miles per gallon of lubricating oil burnt, 1,739.13; (7) highest miles per gallon, 27.71, over a distance of 145.5 miles; (8) lowest miles per gallon recorded, 18.56, over a distance of 129.98 miles; (9) highest ton miles recorded, 50.80, over a distance of 128.04 miles; (10) lowest ton miles recorded, 33.60, over a distance of 129.98 miles; (11) a fair average touring speed was maintained throughout the run, and it is estimated that the average miles per hour may be taken approximately at possibly 23.46. The test was carried out under ordinary touring conditions. In classifying the roads four standards were used, namely: Good, fair, poor, and bad. From 20 per cent. to 25 per cent. of the roads covered could be classified as good to fair, and the balance poor to bad.

COMING EVENTS.

Institution of Petroleum Technologists.—Meeting, Tuesday, December 16, at 5.30 p.m., at the House of the Royal Society of Arts, John Street, Adelphi, W.C. 2. Paper: "The Application of Liquid Fuel to Heavy-oil Engines," by A. J. Wilson, A.M.I.M.E.

Chemical Society.—Meeting, Thursday, December 18. Lecture by Professor J. Walker on "War Experiences in the Manufacture of Nitric Acid and the Recovery of Nitrous Fumes."

The Faraday Society.—Annual general meeting, Burlington House, Piccadilly, London, W. 1, Monday, December 15, at 7.50 p.m. Ordinary meeting, 8 p.m. Papers: "Electrolytic Iron Deposition," by Lieut. W. A. Macfadyen, M.C., B.A.; "The Measurement of Physical Properties at High Temperatures," by A. George Tarrant, B.Sc., A.R.S.C.; "The Electrolytic Formation of Perchlorate from Chlorate," by J. Guilfoyle Williams, B.Sc., A.I.C.; "On the Vapour Pressures of Binary Mixtures," by Professor Alfred W. Porter, D.Sc., F.R.S.; "Some Relations Between the Solubilities of Solutes and Their Molecular Volumes," by Shinkichi Horiba; "An Accurate Method for the Determination of Vapour Pressure," "Some Properties of Copper Ferrocyanide," by E. J. Hartung, D.Sc.; "The Solution Theory of Steel and the Influence of Changes in Carbide Concentration on the Electrical Resistivity," by Professor E. D. Campbell.

MARKET FOR DYES IN BRAZIL.—There is a considerable demand for dyes in Pernambuco, where dye-houses are able at present to dye only in black and one or two other colours. It is possible to get a few colours in aniline dyes in bulk, but, since some experience in the use of these is necessary, the sales to individuals are extremely small.

ITEMS OF INTEREST.

OBITUARY.—Colonel W. Lee Pilkington, who died on Saturday last at his residence, Norley Hall, Cheshire, at the age of 62, was senior partner in the glassmaking firm of Messrs. Pilkington Bros., St. Helens.

MINERALS DEVELOPMENT.—The Minerals Development Association has been formed to assist prospectors and owners of mineral rights. It is hoped in this way to stimulate the mining industry at home and abroad. Its offices are at 24, Lawrence Lane, Cheapside, London, E.C.

LEAD MINES REOPENED.—Lead-mining operations are taking place on a large scale at Llanfrothen, Merioneth. A large number of men are employed at Bwlchplwm Lead Mine, and it is hoped that Penrallt Mine will be restarted at an early date. Both mines had been closed for forty years.

THE ANTI-DUMPING BILL.—A meeting of the Chemical and Allied Trades' Section of the Manchester Chamber of Commerce was held on Monday afternoon to consider the Imports and Exports Regulation (Anti-Dumping) Bill. It is understood that a resolution was adopted demanding that before redrafting the Bill in the next Session the Government will consult the Chambers of Commerce and other trade organisations of the country.

BRITISH SUGAR BEET PROSPECTS.—At the annual meeting of the British Sugar Beet Growers' Society, Sir Veville Stanier, M.P., the chairman, said the Kelham estate had now been so cultivated that they were ready at any moment to begin to grow sugar beet for the factory, which was to be built before the autumn of 1921. Lord Bledisloe, who was chairman of the Royal Commission on Sugar Supply during the war, thought that at no time during the last thirty years had there been such a splendid prospect of the success of this industry in our country. It was agreed to authorise the committee to form a new company, Home Grown Sugar, Ltd., and to transfer the assets of the society to the company.

TITANIUM COMPOUNDS.—In contributing to the discussion of a paper by Mr. V. W. Aubel on "The Titaniferous Iron Sands of New Zealand," Mr. F. E. Bachman said that the titanium compounds, when present in the hearth of a furnace, can be easily removed by introducing materials that will liquify the calcium sulphide and oxidise the titanium compounds. The use of iron oxide, either fine ore or scale, fed into the tuyeres while casting or immediately after casting, offers a convenient means to the end desired. At first thought the introduction of iron oxide through the tuyeres might seem objectionable, owing to its reducing hearth temperature, but where it is reduced by the oxidation of titanium carbide there is a gain instead of a loss of heat.

THE "SINFIELD" STILL.—Patent rights have been applied for covering a very practical type of still involving a great deal which is new in both design and manufacture. The makers, Messrs. Sinfeld Bros. and Chillingworth, Wetmore Works, Burton-on-Trent, supply the following data as an example of one size which they are in a position to supply: Length, 15ft.; diameter, 8ft.; flush capacity, 726.552 cub. ft. (4,526 gallons); flue or firebox, 3ft. 6in. diam.; length of grate, 6ft.; width of grate, 3ft. 4in.; direct (flue) heating surface 82 sq. ft. The main claims are low cost, reduced fuel consumption, accessibility for cleaning, ease with which the firebox can be renewed in a very short period, minimum time still is idle for repairs. The makers undertake to supply sizes to meet all requirements.

GLANDLESS ACID PUMPS.—We have heard great accounts of the new "Marclen" patent centrifugal pump, all of which indicate phenomenal success under the most severe conditions. They involve no cost for labour or packing, and this is a big change where acid pumps are concerned, the reason being that there are no glands to pack, leak, or cut up the spindle. Very severe and protracted tests were made before this pump was put on the market by the makers (Marclen Pumps, Ltd., 25, Victoria Street, London, S.W.1). A very important feature is that no parts liable to wear are exposed to the action of acid, and another the automatic supply control. With static head 40ft. (first stage) or 75ft. (second stage), sizes available range from 800 to 3,300 gallons per hour. Three of these pumps at work in a home county dealing with sulphuric, hydrochloric, and other acids have been at work for two years without repair, and substantially without attention.

ZINC AND ZINC DUST PRICES.—Australian high-grade zinc dust (88-92% metallic zinc) is still in good demand at £75. per ton. The price of Australian electrolytic zinc (99.95% purity) remains at £44. per ton, f.o.b. Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

PHYSICAL CHEMISTRY AT CAMBRIDGE.—The Council of the Senate of Cambridge University, while putting forward a grace for the appointment of a syndicate to consider the allocation and the administration of the benefaction of the British oil companies, are of opinion, after consultation with Professor Sir W. J. Pope, that it is desirable at once to establish a Professorship of Physical Chemistry, the stipend of which would be furnished out of the benefaction. The stipend suggested is £1,000.

OIL DISCOVERY AT RETFORD.—During the last two years the Butterley Coal Company have been conducting borings for coal at Hayton Smeath, near Retford, and now it is reported that oil has been found present to an extent which seems to justify the possibility of the place being worked as oil wells. The oil is said to resemble in every respect the oil found recently in Derbyshire, and it comes away with the water in a thick, pasty substance, and is very inflammable. Experts pronounce it to be of excellent quality.

SCOTTISH OIL INDUSTRY.—A meeting of the Mining Institute of Scotland was held in the Royal Technical College, Glasgow, on Saturday. Mr. R. W. Dron occupied the chair. The possibility of finding liquid oil in Scotland, which had been referred to in a paper by Mr. H. M. Cadell, was discussed at some length. The opinion was expressed that liquid oil was not likely to be found in the present shale fields, but that it might be looked for farther east and west, in Haddingtonshire and Lanarkshire. A point brought out in the discussion was that while Scottish shale workers were afraid that the new company which had been formed for the purpose of taking over the Scottish oil companies would stop the shale mines and leave them only with the refineries, it had been stated that the Scottish oil was needed along with the other oils, and that mining for oil in Scotland would in all probability continue.

TRADERS AND MERCHANDISE MARKS.—The Merchandise Marks Committee has begun its investigations under the chairmanship of Mr. Harry Greer, M.P., and persons and associations who wish to submit suggestions to or to give evidence before the Committee on any of the matters mentioned below are invited to communicate with the secretary, Mr. M. F. Levy, the Patent Office, 25, Southampton Buildings, W.C. 2. The Committee was appointed by the Board of Trade to consider (1) whether any extension or amendment of the Merchandise Marks Act is required in respect of the provisions relating to indications of origin; (2) the utility and effect of "national trademarks" or other similar (collective) marks, and how far they should be authorised or encouraged in this country; and (3) how far further international action may be necessary for the purpose of preventing the false marking of goods.

ROYAL INSTITUTION.—A general meeting of the members of the Royal Institution was held last week, Sir James Crichton-Browne, treasurer and vice-president, in the chair. Dr. Paul Sabatier, Toulouse; Dr. Pierre Pau, Emile Roux, Paris; Dr. Jacques Loeb, New York; Dr. Robert Andrews Millikan, Chicago; Dr. Arthur Gordon Webster, Harvard; Dr. William Wallace Campbell, California, were elected honorary members of the Royal Institution. Mr. J. H. Batten, Mr. J. W. Butler, Mr. G. R. Coursay, Mrs. C. M. Dunbar, Mr. Arthur Holland, Mr. C. C. Lindsay, Mrs. K. A. Riches, Mr. Arthur Ruck, and Lieutenant-Colonel A. Williams were elected members. The following are among the lecture arrangements at the Royal Institution before Easter, 1920: Sir John Cadman, two lectures on (1) "Modern Development of the Miners' Safety Lamp," (2) "Petroleum and the War"; Professor A. E. Conrady, two lectures on "Recent Progress in Photography"; and Professor Sir J. J. Thomson, six lectures on "Positive Rays." The Friday Evening Discourses will begin on Friday, January 16, at nine o'clock, when Professor Sir James Dewar will deliver a discourse on "Low-temperature Studies." Succeeding discourses will probably be given by the Hon. Sir C. A. Parsons, Mr. S. G. Brown, Professor W. M. Bayliss, Dr. F. J. Russell, Mr. W. B. Hardy, the Hon. J. W. Fortescue, Professor J. A. Fleming, Mr. E. McCurdy, Professor Sir J. J. Thomson, and other gentlemen.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—Owing to strikes at the nitrate ports and delays in the arrival of ships, last month's exports from Chili were again on a very small scale, the total being only 94,000 tons, of which 53,000 tons to Europe, 33,000 tons to the United States, and 8,000 tons to "other parts." December is the last month in which shipments can safely be made by sailing vessels in time for the spring season in Europe, and it is to be hoped that the labour troubles will soon be adjusted, so that the numerous steamers now due on the West Coast may receive prompt despatch. The coal strike in the United States will, unfortunately, detain many of those chartered to load within the next three months; and, in any case, there is now only a remote possibility of shipment before the end of March of all the nitrate sold for delivery up to that date. The December production, although still very small at 122,000 tons, actually exceeded the shipments; and the stocks in Chili, instead of being, as expected, very considerably reduced, increased to about 1,675,000 tons, and many oficinas are restarting with accumulations of raw material. As mentioned in our last issue, the Producers' Association has once more raised its selling price—namely, from 9s. 7d. per quintal f.o.b. to 10s. 6d., the original starting-point in September having, it will be remembered, been 9s., but no more than 100,000 tons will be sold even at the advance. No wonder the market is described as "reserved," sales by producers outside the "combine" being meantime reported at 9s. 10d. for prompt delivery and 9s. 7d. for next year's delivery. The market here is nominally firm at about £22. per ton, with little business passing, as Government nitrate is on offer at less money.

Rise in German Fertiliser Prices.—The progress of the rise in fertilisers in Germany is a subject of a short note from official circles, which clearly shows how serious the position is. The great rise in prices since the springtime this year, before the repeated increased prices in March and November took place, is shown as follows:—The price per 50 kilogrammes taken in complete wagonloads, free at purchaser's railway-station, was: Sulphate of ammonia, springtime 18.90 marks, now 56.70 marks, more than 200 per cent.; nitrate of soda, springtime 28.10 marks, now 52 marks, 83 per cent.; ammonia potash, 29.08 marks in the spring, 60.81 marks now—over 109 per cent.; nitrate of lime, 18 marks in the spring and 43.65 marks now, or an increase of 142 per cent. The Central Association for the purchase of agricultural requirements calls the attention of agriculturists to the position, saying that the present prices will probably undergo a further rise before the coming spring. For the harvest of 1920 they must expect a considerable shortage in nitrate supplies, as the railway position makes it almost impossible to assure punctual delivery of fertilisers.

Sulphate of Ammonia.—Trading in this fertiliser continues to be steady as the end of the year approaches, the higher prices which are to rule for late orders apparently substantially helping current business. Amounts for export are not heavy, and, according to certain figures, they look like diminishing still more next year. The British consumption of sulphate of ammonia increased very substantially during the war, and that increase appears to be still going on. Diligent propaganda in the past, the lessons of the war, and the need for still further food production now are together bringing about this state of affairs. On the other side of the Atlantic the news is that the market for sulphate of ammonia is controlled entirely by available supplies, with some sales closed recently at record prices. Domestic producers are still sold up, with no encouragement in sight for any early relief in the situation—at least, until the steel industry is again in normal operation. The export demand for sulphate of ammonia from America has been unusually strong, but, owing to the scarcity of supplies, nothing in the way of improved trading has been registered.

Basic Slag.—The demand for this continues, and there is no chance of deliveries of present bookings before well on into January. This position seems to be becoming chronic now, so substantially has the consumption grown.

Potash.—The advance in the Government official prices for potassic fertilisers does not appear to have either stimulated or reduced trade, business moving at only a quiet level. American advices report that it was expected that considerable quantities of foreign potash would be brought into the United States, but so far arrivals have been in such limited quantities that the small home supplies have had to be relied

upon. What animation the market has out there is consequently controlled entirely by available supplies. The imports of Alsatian potash salts into the United Kingdom during the week ended December 6 were 2,588 tons of sylvinite, 14 per cent. Current prices are as follows: Sylvinite, 14 per cent. (French kainit), £7. per ton; sylvinite, 20 per cent. (French potash salts), £8. 7s. 6d. per ton; muriate of potash, 80 per cent., £19. 7s. 6d. per ton.

Bone Meal.—Bone meal is inclined to be slow for the time being, and prices are not too firm. There has been an arrival of something like 1,500 tons of bone meal in this country during the last month or so, and at current figures and in the state of the market this looks like filling present requirements. There is bone meal on offer at all sorts of prices. Pure steamed bone meal, 1 per cent. ammonia and 60 per cent. phosphate, in bags, is £13. 10s. to £14., ex works; with pure dissolved bones, 3 per cent. ammonia and 32 per cent. phosphate, in bags, £15. to £15. 10s., ex works. There is also dissolved bone compound at about £8. 10s. per ton, all these being very serviceable descriptions and each having its own following.

Fish Guano.—Some amounts of fish meal of a grade below what is usable for feeding live stock and poultry are said to be now on offer at £17. per ton, and, being rich in phosphorus, are pretty generally satisfactory. Some very good fish guano is also again reported to be available at £18. per ton. In this the phosphatic element is said to amount to 14 per cent.

Other Fertilisers.—Superphosphate of lime is moving off quietly, and trade is passing in potassic super, 4 per cent. and 26 per cent., in bags, at £9. 2s. 6d. per ton. Generally, the fertiliser market looks like ending the year with a quiet, steady undertone of business passing and prices very firm. The new descriptions or revived old ones which were expected to have come along by this time have not matured, but next year a generally improved supply of many sorts is reported to be likely. The market is certainly an attractive one for many manufacturers and importers.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

All the tinsplate works that were stopped last week on account of the absenteeism of the picklers are operating fully this week. The short supply of fuel creates some concern. The demand for tinsplates still increases, and outputs are also improving. More mills are to be started as soon as capable men are found to operate them.

The patent fuel business is brisk, and the production is still increasing. Cardiff manufacturers have sent good cargoes to Brest, Dunkirk, and Dakar. The Swansea shipments include 3,100 tons to Rio Grande de Sul, 3,000 tons to Rouen, 4,000 tons to Piræus, and other smaller parcels to St. Malo, Havre, and Rouen. The controlling interest in the Cardiff and Newport Patent Fuel Company, Ltd., has been acquired by Mr. W. H. Renwick, J.P., Cardiff.

A somewhat unusual application was made to the Swansea County Court judge. The claim was in respect of a recurrence of pitch cancer after the claimant had left the respondents' service, and his Honour held that there was no intervening accident within the meaning of the act since the applicant had left that employment, that the disablement was due to his working on the pitch before he left respondents' employment, and accordingly he was entitled to compensation for recurrences of the disease. A stay of execution was granted.

Relative to the case of breaking up steel drums that had contained sulphuric acid, which led to an explosion, through which a man who was using an oxy-acetylene flame was killed, Mr. Justice Lush has now given his judgment, and has found that there was no negligence on the part of the defendants, Mr. Arthur John, Llanelly, and Messrs. Pearce and Son, Sheffield.

On Wednesday the funeral of Mr. Herbert Selwood Sutton took place at Cadoxton. Mr. Sutton was the principal of the firm of Messrs. T. S. Sutton and Sons, metal refiners, etc., Neath.

Cokes are selling finely, and the by-product ovens are fully operating. Sulphate of ammonia moves off well, there being no difficulty in disposing of all the production in this area. Export business is slightly better, although shipments are still very meagre.

The spelter trade just now is good, and furnaces are working regularly, but there is a difficulty in getting the requisite quantities of coal to the works.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month ending Nov. 30th, 1919, as compared with Nov., 1918.

ARTICLES.	QUANTITIES.		VALUE.		ARTICLES.	QUANTITIES.		VALUE.	
	Month ended		Month ended			Month ended		Month ended

(To be concluded.)

PARLIAMENTARY NEWS.

Fertilisers.

In the House of Commons on Monday, Sir N. Griffiths asked the Parliamentary Secretary to the Board of Agriculture what quantity of sulphate of ammonia, ground basic slag, and superphosphates is at present imported from Germany, the cost to the British Government of such importation, and the present retail price of such fertilisers?

The Parliamentary Secretary to the Board of Agriculture (Sir Arthur Boscawen): I am informed that no sulphate of ammonia, ground basic slag, or superphosphate is being imported from Germany. The present maximum prices of the respective fertilisers are:—

Sulphate of Ammonia.—For sale in lots of not less than two tons for delivery by rail or water to purchaser's nearest railway-station or wharf in Great Britain, less a trade discount to agricultural merchants, dealers, and co-operative societies:

Month of Delivery.	Price per Ton, in bags.	
	net Cash.	
	£	s. d.
December, 1919	21	0 0
January, 1920	21	7 6
February	21	15 0
March, April, and May	22	0 0

Basic Slag.—The maximum prices range from 62s. per ton for slag containing 12 to 14 per cent. total phosphates to 102s. per ton for slags containing 42 to 44 per cent. total phosphates. The prices include delivery in makers' bags to purchaser's nearest station or wharf for minimum lots of four tons. In the case of both sulphate of ammonia and basic slag the prices given include, in deliveries to Ireland, Isle of Man, or Channel Islands, delivery f.o.b. port in Great Britain.

Superphosphate.—Owing to the varying cost of importing phosphate rock, it has not been possible to arrange for superphosphate to be sold at a uniform delivered price. During the 1918-19 season phosphate rock and other materials were sold to superphosphate makers by the Government at less than market prices. This assistance has been discontinued. The present quotations for 30 per cent. superphosphate are from £7. 5s. to £7. 7s. 6d. per ton, free on rail.

Sir N. Griffiths asked the Parliamentary Secretary to the Board of Agriculture what, if any, profit the Government are making per ton on basic slag now being sold at fixed prices ranging from 62s. per ton for 12 per cent. up to 102s. per ton for 42 per cent. of total phosphates; and will he state what proportion, if any, of such basic slag is made up out of material obtained from Germany?

Sir A. Boscawen: No basic slag is sold by the Government, nor do they profit by the sales made by makers. As regards the latter part of the question, I am informed that no raw slag is being obtained from Germany.

Sir N. Griffiths asked the Parliamentary Secretary to the Board of Agriculture whether he is aware that the trade are unable to accept orders for a quality of basic slag over 22 per cent., and that even this quality is only obtainable after considerable delay; and what steps he proposes to take in this matter in view of the serious effect such delay will have on next year's crops?

Sir A. Boscawen: I must refer my hon. friend to the answer I gave on the 2nd inst. in reply to a question by the hon. member for Monmouth.

Mr. Hohler asked the Parliamentary Secretary to the Ministry of Munitions whether the Government, directly or indirectly, control the supply and the price of sulphate of ammonia, basic slag, and superphosphate; will he state the average price per ton paid for each of these fertilisers by the Government from April 1 to September 30 last, the average price at which they were sold during the like period to the merchant or factor, and the price the merchant or factor was authorised to charge the consumer; did the Government make any and what profit during the above period by dealing in the above fertilisers; and will he give the average profit per ton?

Mr. Hope: The Ministry of Munitions does not control the supply of the fertilisers referred to; the prices at which they could be sold up to May 31 last were fixed by the Fertilisers Prices Order, 1918. The Ministry has never had any trading transactions in superphosphates or basic slag; but at the date of the armistice it had small stocks of sulphate of ammonia, which have since been sold.

Mr. Harry Hone asked the Parliamentary Secretary to the Board of Agriculture whether, in view of the necessity for securing a full supply of superphosphates, he will take steps to enable phosphate rock from Algiers being imported, instead

of the low-grade and inferior quality of phosphate rock at present being brought in from America?

Sir A. Boscawen: Arrangements have already been made for the importation of phosphate rock from Algiers and Tunis which will bring up the total deliveries from these countries to the United Kingdom to 277,000 tons during 1919. Arrangements have also been discussed with the French authorities for the delivery of a substantially larger quantity during 1920. The matter is receiving the close attention of the Board.

British Dyes, Ltd.

Major Barnes asked the President of the Board of Trade if his action in giving preferential assistance to a particular company engaged in the manufacture of dyes by subscribing to the share capital of that company has received the consent of the House of Commons; and, if not, if he proposes to submit his action for the approval of the House?

Sir H. Greenwood: The policy of Government financial support to British Dyes, Ltd., was fully discussed in this House in 1915; and as regards the recent change in the form of that support, I would refer the hon. member to the answer to his previous question.

Major Barnes asked the President of the Board of Trade in what vote or votes appears the whole or any part of the sum of £1,700,000, subscribed by the Government to the share capital of the British Dyestuffs Corporation, or if the whole or any part of it has not yet appeared; and in what vote and when the sum or any part of it will be submitted to the House?

Sir H. Greenwood: Provision for £334,046., being balance of a sum of £1,500,000, for investment in British Dyes, Ltd., will be found in the Board of Trade Estimates, Class II., Vote 8, Sub-head 1, for 1919-20. The sum of £1,165,954. previously invested in such debenture bonds was provided out of the vote of credit, and has appeared or will appear in the appropriation accounts relating thereto. These bonds were cancelled during the present financial year, and the sum of £1,700,000, was invested in the British Dyestuffs Corporation in the purchase of the following fully-paid shares—namely, 850,000 7 per cent. preference shares of £1. each; 850,000 8 per cent. preferred ordinary shares of £1. each. One fully paid preference share (£1.) was allotted to the nominees of the Government conferring special voting powers under the articles of the company. The balance, for which no provision was made in the Board of Trade Estimates, has been temporarily met out of the Board of Trade Vote, and it is proposed to submit a supplementary estimate, to be laid before Parliament in due course.

Alkali Manufacture and the Transport Situation.

Mr. Henderson asked the Minister of Transport whether he is aware that the caustic-soda and bleaching-powder plants in Widnes of the United Alkali Company, Ltd., employing from 1,500 to 2,000 men, will be shut down within a few days unless facilities are afforded for transporting lime from Buxton; whether he is aware that there are 5,000 tons of limestone waiting at Buxton which cannot be brought to Widnes in consequence of the lack of wagons; and whether he can take special action in this case in order to prevent the enforced unemployment of so many men?

Mr. Neal: Wagons for limestone are provided by quarry owners, but whenever possible the railway company have in the past supplemented the supply, and will continue to do so. I understand that the United Alkali Company's reason for requiring additional wagons now is due to the fact that they relinquished last July seventy-five wagons which they had on hire.

Ferro-alloys Manufacture.

Sir A. Geddes, in reply to Mr. I. Griffiths, said: Ferro-tungsten and tungsten powder have been placed in the schedule of products of unstable key industries, of which the importation is prohibited because of their importance in the manufacture of high-speed steel, which is essential for the engineering industries, and the fact that before the war the United Kingdom was entirely dependent for the supply of these products upon Germany. It is difficult to compare the relative values of various alloys with differing applications, and though the importance of ferro-chrome is, I think, fully recognised, the Government felt that the case for its special treatment was less strong than that of the substances and articles whose importation they have restricted. The difficulties in which British manufacturers are placed are, I understand, mainly due to the existence of large stocks in this country. The hon. member will no doubt have an opportunity of raising the matter again when the House comes to consider in detail the problem of safeguarding key industries.

Cumberland Coke Ovens.

Mr. Forrest asked the Minister of Transport whether he was aware that the railway-wagons loaded with Durham coke and sent into Cumberland were brought back empty; and whether he would consider the possibility of using those wagons on the return journey for bringing Cumberland coke to the North-Eastern ports, thereby making greater use of the wagons and assist in increasing employment at the Cumberland coke-ovens, which were now working at less than half their capacity?

Sir E. Geddes: I am aware of this movement of coke in both directions, and am inquiring as to the best means of dealing with it.

Anglo-Persian Oil Company.

Mr. Chamberlain, replying to Major Barnes, said: His Majesty's Government at present hold 2,000,000 £1. shares in the Anglo-Persian Company, out of 3,000,000 ordinary shares, and have agreed to subscribe in the same proportion to the total ordinary share capital for a further 3,000,000 ordinary shares of £1. each, on which 1s. per share will be immediately paid up. It has been arranged that the remaining 19s. per share on 2,000,000 shares will be paid up shortly. The calls on the remaining 1,000,000 shares will not be made for some years. Tentative arrangements for financing the call of 19s. per share on the 2,000,000 shares have been made and will be embodied in a Bill which will be presented to the House immediately.

Mr. Swan asked the Chancellor of the Exchequer whether any limitation of profits was imposed on the Anglo-Persian Oil Company in consideration of the financial assistance given to that company by His Majesty's Government?

Mr. Chamberlain: No, sir; except that the price ruling under the Admiralty contract for fuel oil is subject to reduction in proportion to the profits realised above a certain limit. There is every reason to hope that a substantial saving will be secured by the Admiralty under this head during the ensuing year.

Palm Kernel Exports.

Lord H. Cavendish-Bentinck asked the Prime Minister whether the Government would give a day for the discussion of the restrictions on the export of palm kernels and other vegetable oil products from the British dependencies to territories other than British?

The Prime Minister: I do not think that there would be a general desire for this discussion, and the pressure upon Parliamentary time is very great.

Sales of Explosives.

Mr. Haydn Jones asked the Parliamentary Secretary to the Ministry of Munitions whether the sum of £12,000., mentioned as having been realised for explosives from the store at Dinas Mawddwy, was in respect of the class of explosives which has been for some months and is now contained in the store, or was it in respect of explosives previously removed?

Mr. James Hope: The sum of £12,000. was realised in respect of a sale of explosives of the same type as that at present stored at Dinas Mawddwy.

LEGAL INTELLIGENCE.

Infringement of Copyright in Trade Advertisement.

In the Chancery Division on Friday, (December 5), Mr. Justice Peterson had before him a motion by the Deptford Steel and Iron Works, Ltd., for an injunction restraining John Thompson (Wolverhampton), Ltd., from infringing the plaintiffs' copyright in an advertisement published in the *Chemical Trade Journal and Chemical Engineer*, in connection with homogeneous lead coating for vessels used for chemical purposes.

Mr. Hughes, K.C., for the plaintiffs, stated that they owned a secret process for homogeneously attaching sheet lead to the surface of iron and steel so as to form a perfect union, and that they had entered into a long working agreement with British Dyes, Ltd. The plaintiffs had inserted their advertisement in the *Chemical Trade Journal and Chemical Engineer* for some time, and in the issue of that paper of November 22 it appeared on page xiii. To their astonishment on page xvii. they found an advertisement by the defendants, "as specialists in homogeneous lead coating," which was an obvious copy of the whole of plaintiffs' advertisement so far as it related to lead-lining work. This was calculated to do the plaintiffs serious injury.

Mr. Dighton Pollock, for the defendants: We have agreed an order.

Mr. Hughes: I understand that the defendants are prepared to submit to an order and pay an agreed sum as damages.

Mr. Pollock: It has already been paid.

Mr. Hughes: And will pay the costs as between solicitor and client?

Mr. Pollock: Yes.

Mr. Hughes: I think that the apology plaintiffs required has in fact been given.

Mr. Pollock: That is so.

His Lordship made an order in the terms agreed.

Claim for Damage by Explosion.

The Court of Appeal, composed of the Master of the Rolls and Lord Justices Atkin and Younger, on December 4 reserved judgment upon the appeal of the defendants in the case of the British Fish Guano Company, Ltd., v. the Rainham Chemical Works, Ltd., and Ind, Coope and Co. (1912), Ltd., v. the same defendants, from judgments of Lord Justice Scrutton sitting as an additional judge of the King's Bench Division. The plaintiffs in both actions claimed damages from the appellant, a private chemical company, for injury to their premises caused by an explosion at the appellant's works, and which catastrophe was caused by a quantity of dinitrophenol being exploded at the time of the explosion. Appellant's works were divided into two parts: One part was paid for by the Ministry of Munitions and was for the supply of explosives to the Government; and there was another separate part, which was used for supplying other persons with explosives, and that was not paid for or controlled by the Ministry.

Lord Justice Scrutton held that the defendant company were liable for the damages caused to the plaintiffs by the explosion, and from this decision the defendants now appealed.

Grays Chemical Works: Winding-up Petition Withdrawn.

The petition for an order to compulsorily wind up the Grays Chemical Works, Ltd., was finally disposed of on Tuesday in the Companies Winding-up Court.

Mr. Lavington said the petition was adjourned for a fortnight for the company to try to raise capital to pay their creditors, and an undertaking was given; but since then the company had passed a resolution to wind-up voluntarily.

His Lordship: That is unusual.

Mr. Lavington said the meeting was held on Monday, but probably under a misapprehension.

Mr. Vanneck, for the company, said that was so.

His Lordship said the directors called the meeting after having given the undertaking, and that was rather a serious thing. He thought the best thing to do would be to make a compulsory order. But he would wait until after the luncheon interval to see if the petitioner (a Mr. G. T. Morgan) was satisfied.

After the adjournment, Mr. Lavington said the petitioner had been satisfied.

The petition was therefore withdrawn.

Bisulphide of Soda Fumes.

The circumstances and cause of the death of David Hutton, aged 54, a colour-mixer's labourer at the Tottington Mill of the Calico Printer's Association, were the subject of inquiry by Mr. S. F. Butcher (district coroner), at Bury.

Nathan Hunt, foreman colour-mixer at Tottington Mill, said deceased was a colour-mixer's labourer at the Mill. He stayed off work about the 6th ult. He did not know why. Deceased was not sick at his work. About three weeks before the 6th witness told him to tap a barrel of bisulphide of soda. He did not make any complaint, but the next morning he told witness that he had had a restless night, and that he got a mouthful of bi-sulphide of soda from the cask he tapped the previous day. There had not been a great deal of sickness at these works. Asked by the Coroner if there had not been a good deal of blood poisoning among calico printers, witness said he could only speak of his own department, and there had not been there. Bi-sulphide of soda was used in the printing process, and it was mixed with the colours. There had not been to him a general complaint on the part of the printers that they were suffering through something in the colours, and he had not been informed by anyone that there was such a complaint existing.

Examined by Mr. Hird (the Factory Inspector), witness said: A short distance away from where the barrels were tapped there was an exhaust-fan—about ten feet away, and that fan tended to clear the room of any fumes. No other men had complained of the work. The effect of the sulphurous acid could be felt when it came off, but it soon went away. It usually affected the chest, and was worse when a new barrel was tapped. He had not noticed anything different lately in the casks. He had not known anyone permanently affected by the work, and he had had 21 years' experience.

Charles Burgess Davies, works manager, said there had not been any change in the character of the materials they used within the last six months, and it was the same chemical compound they had used for the last 25 years. It was regularly analysed, and they had never had any adverse reports upon it. It was a surprise to hear about that case. They had had two printers with rash on their hands for a few days during the last nine months. He questioned them, and in both instances they said it was eczema. In neither case had they been using that compound. There had not been any complaints to him of men suffering from their hands. He had never heard of anyone being poisoned by opening a barrel of bi-sulphide of soda.

The inquiry was adjourned until Friday, December 19.

Compensation Claim.

In the King's Bench Division, on Saturday last, Mr. Justice Lush gave a considered judgment in an action brought by Mrs. Margarate Keene, widow, Llanelly, against Mr. A. John, contractor, carrying on business at Llanelly, and Messrs. Pearce and Sons, scrap-metal merchants, Sheffield, to recover for the loss of her husband, whose death, she said, was due to negligence and breach of duty on the part of the defendants.

The defendants denied negligence or breach of duty, and pleaded contributory negligence or the part of the deceased.

His Lordship said the plaintiff's husband was in the employ of the defendant John, and on November 6, 1918, he was engaged in breaking up old drums which had been purchased of Messrs. Pearce and Sons. One of the drums was air-tight, and the deceased knocked a hole in it with a pick. He then applied a jet flame of acetylene gas to the drum, with the result that there was an explosion, Keene not having waited for the hydrogen gas which had accumulated in the drum to escape. Keene received injuries from which he died in a few hours. The plaintiff alleged the defendant John was guilty of negligence in not making inquiries as to the contents of the drum, and that Messrs. Pearce and Sons were negligent in not warning the defendant John of the possible presence of gas in the drum. His Lordship was of opinion that there was no negligence on the part of the defendants, and no contributory negligence on the part of the deceased, and, accordingly, entered judgment for the defendants, with costs.

His Lordship assessed the compensation to which the plaintiff was entitled under the Workmen's Compensation Act, 1906, at £300., and directed that the defendant John should be paid his costs of the action out of the amount awarded the widow.

Phosphate for Munitions: Action in Prize Court Against Crown.

The President in the Prize Court on Wednesday concluded the hearing of the action in which the Svalfvelsyre Fabriks Aktiebolaget claimed damages from the Crown, or, alternatively, the fair value of a cargo of phosphate rock on the Consul Olsson, in respect of which the appraised value of £16,420. was paid into court by the Crown after the Government had requisitioned the cargo. The Crown had "released" the goods as innocent of enemy interest upon investigation.

Mr. Lillie, for the Crown, stated that the shippers, the National Zinc Company of New York, a firm of smelters, had as president a Mr. Leo Wreschner, and a Mr. Leo Wreschner was a partner of the well-known firm of Beer, Sondheimer and Co., of Frankfurt on Main, Germany, and an association between the two was at one time assumed, but the cargo appeared to have been sold to the claimants f.o.b. at Tampa, Florida. However, the Crown contended, on the score of damages, that there was reasonable ground for the seizure of the goods. The claimants asked for damages either for wrongful seizure and detention or in respect of under-appraisal of value, and the Crown's reply was that the seizure was *bona fide* and the appraisal binding on all parties.

His Lordship intimated that he had reserved his judgment, and if he came to the conclusion that the appraisal made for the Crown was not conclusive he would hear the parties further on the questions of valuation. He would decide the principle first.

Alleged Damage by Picric-acid Fumes.

Mr. Pollock, High Courts' Official Referee, on Wednesday continued the hearing of an action of considerable importance to chemical manufacturers which had already occupied four days at Leeds. The plaintiffs were Mr. Richard Kershaw, of Leamington, and Sarah Elizabeth Young, of Harrogate, the owners of property at Halifax, and the defendants the Brooks Chemical Company, of Lightcliff Works, Halifax. The plaintiffs claimed damages in respect of alleged injury done to an estate called "Crow's Nest," Halifax, by an injurious nuisance occasioned by the manufacture of picric acid. Plaintiffs also asked for an injunction.

In continuation of the defendants' case, Mr. Chas. Wm. Fennell, land agent and surveyor, of Wakefield, was called. He said that such damage as had been done to trees did not in his opinion depreciate the value of the property, and the fact that the house remained unlet was in his opinion due to its character rather than to any nuisance which existed. It was not, he said, a property that could be readily let, unless they came across a man with more money than brains, which was most unusual in Yorkshire.

In cross-examination by Mr. Waugh, K.C. (for plaintiffs), witness said he did not think any person deciding to purchase any of the property in question would take notice of the alleged nuisance from picric-acid fumes. He would get used to it just the same as he had got used to eating margarine.

Further evidence was given to show that the houses had no special value in the district as residential property, and the hearing was adjourned.

Perry, Mills and Co.

At the London Bankruptcy Court on Tuesday last before Mr. Registrar Mellor, the adjourned public examination was held of Joseph Algernon Hare Duke and Henry Slater, trading as Perry, Mills and Co., agents and merchants, at 29, Gracechurch Street, E.C. An amended statement of affairs filed by the debtors showed gross liabilities amounting to £37,783. 11s. 4d., of which £14,911. 15s. 7d. was expected to rank against the estate for dividend. The assets were returned at £2,492. 12s. 6d. The business was commenced in 1912, and was carried on for the purpose of exporting chemicals to the Continent, and the debtor Duke appears to have previously been concerned in the flotation of a margarine company, and had also been a director of Oil Refineries, Limited.

The Official Receiver said the debtors had amended the statement of affairs, which now appeared to be quite in order, and he had no further questions to put to them.

The examination was closed.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

Once the year is turned there can be little doubt now that operations in the coking and by-product industries of this district will be on a much fuller scale than has been the case for seven or eight months. The hematite pig-iron trade, it is believed, is only waiting the termination of the moulders' strike to burst into activity on a scale such as was witnessed when the Government released control in April last, and in that case, of course, additional furnaces would be put on to ordinary iron, and the full production of the coking plants would be absorbed. Meantime, there is every prospect of an awkward interval being bridged by the growing demand from the Continent for local coke. Contracts have now been fixed up for a tonnage to be delivered to the Continent, which represents the maximum capacity of the 380 ovens for at least three months to come. At the present moment trucks are lacking, and it is impossible to carry more than a few hundred tons weekly to the East Coast for shipment. The wagon shortage, however, is one that will become easier shortly, and the ovens will then be put into full swing. The by-product industry is distinguished by no special feature.

REPORTS OF COMPANIES.

Sulphide Corporation, Ltd.

The report for the year to June 30 last states that the net profit is £308,508.; £30,000. was paid in July as an interim dividend of 5 per cent. on the preference shares, leaving £278,508. The directors now recommend that, after placing £30,000. to reserve for contingencies, a further dividend of 10 per cent. be paid on the preference shares and a dividend of 15 per cent. on the ordinary shares, carrying forward £121,008. In consequence of the failure of coal supply, caused by the protracted maritime strike in Australia, and of the unsettled condition of labour which led to local strikes at Broken Hill, operations at the Central Mine were suspended for upwards of thirteen weeks, with the result that the extraction of ore fell off to the extent of 9,873 tons, the quantity of ore raised being 113,457 tons, as compared with 123,330 tons in the previous year. The suspension of work at all the Broken Hill Mines has continued since the financial year closed on June 30 up to the present date. The computation of ore reserves at the conclusion of the year shows that there was available for future extraction 1,506,950 tons, the quantity developed during the year being approximately 11,900 tons. The amount of ore treated in the concentrating mill was lower by 32,133 tons, with a corresponding reduction of 4,543 tons in the output of lead concentrates and 6,111 tons in that of zinc concentrates. Despite the industrial disturbances at Broken Hill, operations at the Cockle Creek works have been maintained throughout the year without intermission. The tonnage of bullion treated in the refinery amounted to 26,263 tons, and the recoveries have again been very satisfactory. The final products were: Gold, 17,599oz.; silver, 2,127,082oz.; soft lead, 22,935 tons; antimonial lead, 359 tons. The lead produced was, with the exception of about 3,000 tons, sold under the Ministry of Munitions contract, and the balance is now in the course of realisation. The producer (Mond) gas plant yielded 710 tons of sulphate of ammonia, together with 114,389gals. of tar, the latter, after distillation, providing 58,300gals. of fuel oil used for refinery purposes. The acid and superphosphate plants produced 15,524 tons and 25,448 tons respectively, as against 13,297 tons acid and 21,658 tons superphosphates in the previous year. Of the total tonnage of superphosphates for the year under review, 8,805 tons were produced on behalf of other manufacturers, owing to a general shortage of acid experienced by them. As a result of additions made to the copper leaching plant, all copper matte can now be converted into sulphate of copper or precipitate, according to requirement. The experiments in the treatment of slags for the recovery of zinc continue on satisfactory lines, and there are indications that a successful result will be ultimately attained. The zinc-distilling works at Seaton Carew were subject to the same disabilities as prevailed in the previous year, which were further intensified by increased labour difficulties. The tonnage treated in the distillers was 8,256 tons, as compared with 9,909 tons in the previous year, the resultant products being 2,484 tons spelter, 77 tons zinc-dust, and 10 tons metallic lead. The reduction in the quantity of ore treated and spelter produced has been due mainly to the impossibility of obtaining adequate supplies of zinc concentrates from Australia owing to the restrictions on shipping, while working costs have been greatly increased by the rise in the price of coal, labour, and materials, as well as by the reduced scale of operations. The works have remained under Government control, and the contract with the Ministry of Munitions for the sale of all spelter produced continued in force. The capital expenditure during the year amounted to £18,221., being a further contribution towards the extension of the works under agreement with the Ministry of Munitions.

Peruvian Corporation, Ltd.

The accounts to June 30 last show a profit for the year of £265,113., after deducting the usual charges and debenture interest at the reduced rate of 4 per cent. In the income brought into the corporation's revenue account there is a decrease of £84,974. as compared with the previous year. To the above-mentioned profit of £265,113. has to be added the sum brought forward from last year, and, after deducting the charges for amortisation of debentures, income-tax, and lake steamers' insurance, the net revenue shows a balance of £324,774. The directors will submit at the general meeting a resolution for the payment of a dividend of £1. per cent. on the preference stock, and will set aside and appropriate on a separate account at the bankers of the

Corporation the additional debenture interest of £2. per cent., making the interest £6. per cent. for the year. After providing for the additional £2. per cent. debenture interest with the amount of amortisation, together £108,000., and deducting the dividend proposed to be paid on the preference stock, amounting to £74,575., there will remain £142,198. to be carried forward.

Sapon Soaps, Ltd.

An extraordinary general meeting will be held in London on December 17 to authorise an increase in the capital to £300,000. by the creation of 500,000 new ordinary shares of 4s. each, ranking *pari passu* in all respects with the existing ordinary shares. It is proposed to offer the new shares in the proportion of five new shares for every two preference shares held, and one new share for every two of the existing ordinary shares held. The increased capital, it is stated, is absolutely essential for the requirements of the business and to increase its resources to an extent commensurate with the demands made upon its funds by the greatly increased cost of raw materials; also to provide additional buildings and installations of new machinery, which are required to meet the rapidly growing demand for the company's products. Negotiations are pending with a firm of soapmakers in Marseilles for the erection of a plant for the manufacture of soap under this company's patented process. If these negotiations are completely successful, all the capital will be found by the French company, and this company will receive a substantial interest in shares, ranking *pari passu* with the capital provided in France. This company has just announced a maiden dividend on the ordinary shares of 2½ per cent.

Weardale Lead Company, Ltd.

The ordinary general meeting was held last week in London, Mr. Edmund P. Deas (chairman of the company) presiding. The Chairman said the trading profit was £9,927., a decline of £13,901. 7s. 9d., due mainly to the low price of lead which ruled over the last eight months of the financial year. The big quantity of lead held by the British Government after the war was the direct cause of the market falling so low. Now that this stock had been reduced, and a real need for lead for manufactured products was being felt, the market price had risen to nearly £40. per ton again. It seemed quite certain that the price of lead must be maintained at a high standard—at least, until wages, freights, etc., came down to lower levels. Another factor was a reduced yield of metal from the ground worked at Boltshurn, their principal mine. Owing to various local conditions, the company's smelting operations had not been very satisfactory of late years, and they had concluded a contract for the sale of the ore on satisfactory terms. In all the circumstances, the board felt that the final dividend of 5 per cent., making 7½ per cent. for the year, free of income-tax, was satisfactory. The Chairman concluded by moving the adoption of the report and accounts.

Mr. H. S. Willis seconded the motion, which was adopted.

Anglo-Persian Oil Company, Ltd.

Presiding at the annual meeting in London, on Monday, Sir Charles Greenway, Bart., chairman, in the course of his address, said: As you are all aware, we have recently acquired a controlling interest in the Scottish Shale Oil Companies through the Scottish Oils, Ltd., and have thereby added considerably to our refining facilities in this country. The refineries of these companies have a combined capacity much in excess of the present output of shale oil, and our intention is to supply them with such additional quantities of natural crude oil from Persia or elsewhere as may be necessary to enable the refineries to be utilised to the full extent of their capacity. This will not only effect a substantial reduction in the present refinery costs of shale oil, but also, by combining the management of these concerns under one company, largely reduce the costs of administration. By these combined economies we hope to be able to keep alive a home industry—giving employment to many thousands of men—which otherwise was doomed to destruction. We have also under contemplation the erection of refineries in other parts of the world, it being a demonstrable fact that to such an extent as the products can be disposed of in such countries it is far more economical to refine the crude oil in the countries where the products are to be sold than in the countries where the crude is produced. This is a point regarding which there has been some difference of opinion in the past among oil producers, but which is now pretty generally accepted as an axiom.

Wall Paper Manufacturers, Ltd.

The accounts for the year to August 31 last show that the profit, after making reserves for excess-profits duty and postponed repairs, is £336,614., and £160,068. was brought in. After payment of interest on debenture stock and interim dividends to preference and ordinary shareholders, and interest to vendors in lieu of such interest and dividends, and income-tax, the amount available is £390,945. The directors propose a further dividend on the ordinary at 8 per cent., making 10 per cent. for the year, and a dividend on the deferred shares for the year at 5 per cent.; transfer £35,000. to a "contingencies fund," and carry forward £160,417.

Liverpool Nitrate Company, Ltd.

At the annual meeting in Liverpool on December 4, the Chairman (Sir Robert Harvey), in the course of his address, said: The present need for nitrate of soda is great and urgent, but, so far as the coming season is concerned, the available supply to meet the demand, will be very limited. The tonnage to carry it is confined to foreign-owned vessels, as British ships have to carry other produce, and are not granted licenses to load nitrate. The rate of freight for nitrate is therefore unduly high, and to the entire benefit of the foreign shipowner. I am credibly informed that if the present restrictions were removed, much lower freights for nitrate would be ruling, and the position of the British shipowner benefited. Germany requires an enormous amount of nitrate of soda; but owing to depreciation of the mark and the farmer having to sell his product at fixed maximum prices, it is impossible for him to use artificial fertilisers, which have to be imported. The adverse exchanges of France and Italy also tend to check the importation of fertilisers into these countries. The undoubted advantages of nitrate of soda for increasing the yield of crops have now become more widely recognised, and I hope that the experience of the war as to the necessity for intensive cultivation, coupled with the rise in the land values and agricultural wages, has not been lost on the farmers of this country.

Tyee Copper Company, Ltd.

The accounts for the year to April 30 last show an addition to the debit balance of profit and loss account of £558.

British Uralite Company (1908), Ltd.

The report and accounts for the year ended June 30, 1919, disclose a loss of £446. 9s. 8d. after allowing for depreciation. As forecasted in the previous report, the cessation of hostilities had the effect of terminating Government orders, and, coupled with the period of slackness and unrest through which the building trade has been passing, the sales of the company's products have been very adversely affected, the prices ruling at the same time also being exceptionally low. The outlook for the current year is more favourable, although the building trade still remains in a state of great uncertainty, and prices for nearly all classes of goods manufactured by the company remain at a low figure due to competition between manufacturers and the realisation of heavy stocks in the hands of the Government.

Courtaulds, Ltd.

An extraordinary general meeting will be held in London on December 15 to pass a resolution revising and extending the articles of association; while a further meeting will be held on December 30, when resolutions will be submitted for increasing the capital to £4,000,000. by the creation of 1,500,000 new shares of £1. each, all ranking *pari passu* with the existing shares, and that the sum of £1,999,993., to the credit of the general reserve account, be capitalised and applied to the paying up in full of the 999,993 shares of £1. each of the company, to be distributed amongst holders of existing shares.

Power-Gas Corporation, Ltd.

The report for the year to September 30 last states that the results of the trading during the year have been satisfactory. The fully paid shares in satisfaction of the purchase price of business and patents of Messrs. Lynn and Rambush have been issued during the year. The accounts show a profit of £33,561., and £16,797. was brought in, making £50,358. The directors have appropriated £6,700. to reserve,

and recommend a dividend at the rate of 6 per cent. per annum, less tax, carrying forward (subject to excess-profits duty) £26,309.

Cape Copper Company, Ltd.

The accounts for the year to August 31 show a loss of £171,006., while, after transferring £35,966. from income-tax provision account and £80,000. from the reserve fund, a debit balance of £51,501. was carried forward, as against a credit balance of £4,212. brought down.

Wetcarbonizing, Ltd.

In their report for 1918 the directors state that the factory at Dumfries has been completed during the current year, and is now working. Negotiations for the use of the company's process in foreign countries are at present in progress.

India Rubber, Gutta Percha, and Telegraph Works Company, Ltd.

The net profits for the year ended September 30 were £71,913., and £90,955. was brought forward. A final dividend of 15s. per share is proposed on the ordinary shares, making 10 per cent. for the twelve months, and carrying forward £100,368.

Bryant and May, Ltd.

An extraordinary general meeting was held on Wednesday in London for the purpose of submitting resolutions: (1) Increasing the capital of the company from £1,480,000. to £2,000,000. by the creation of 520,000 new shares of £1. each, 320,000 of these shares to be ordinary shares, and the remaining 200,000 partnership shares; and (2) altering the articles of association. The resolutions were carried unanimously.

DIVIDENDS.

UTAH COPPER COMPANY.—Dividend of \$1.50. per share.

CHINO COPPER COMPANY.—Dividend of 75 cents per share.

RAY CONSOLIDATED COPPER COMPANY.—Dividend of 50 cents per share.

THIRTY YEARS AGO.

From the "Chemical Trade Journal" of December 14, 1889.

Tyne Chemical Trade.—A war of prices seems likely to follow, in the chemical trade, the expiration of the Bleaching Powder Makers' Association. Bleaching powder as shown in our commercial column has fallen nearly £1. per ton in a month, and has been offered for delivery early next year at £5., and refused. In other words, the price now asked for next year is about 30 per cent. less than it was at the beginning of this quarter. In the war of prices the customer may benefit for a time, but the competitors suffer, and the chemical industry here may be further reduced.

Red Phosphorus.—Backed by the recommendations of the Academy of Medicine and the Hygienic Council, a bill is about to be introduced into the French Chamber to make the substitution of red for yellow phosphorus in the manufacture of lucifer matches compulsory. It is now four and forty years since Schrotter discovered red or amorphous phosphorus; and considering how long it is since its safety in match-making was recognised, the wonder is that its enforced use has been so long delayed. The red phosphorus cannot be dissolved in a draught; it is not poisonous; introduced into an animal, it is excreted as it entered; it undergoes no alteration by exposure to the air; it is not ignited by friction; it has to be heated to 260° in order to take fire; and when it alone is used in match factories, there can be no deadly phosphorus disease.

Petroleum-proof.—A new cement is described in the current *Monde de la Science* which is attacked by neither petroleum, benzene, turpentine oil, nor any similar liquids. It consists of a mixture of glycerine with gelatine or glue. The product is quite liquid when hot, and resembles caoutchouc when cold, alike in appearance as in its elastic properties. Applied hot to the interior of a barrel or any wooden vessel, the latter is thereby, according to the *Monde de la Science*, made safe for holding any of the above-mentioned substances.

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS.

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during the month ending Nov. 30th, 1919, as compared with Nov. 1918.

(To be concluded.)

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

December 1st to 6th (inclusive).

Lake Dye. Baddiley, J.; and British Dyestuffs Corporation. 30,461.
 Ferro-chrome. Ballantine, W. B. 30,108.
 Ferro Alloys. Ballantine, W. B. 30,472.
 Dyestuffs of the N-arylated Triphenylmethane Series. Barr, J.; Bentley, W. H.; and Clayton Aniline Co. 30,015.
 Aniline Blue. Barr, J.; Bentley, W. H.; and Clayton Aniline Co. 30,016.
 Oxide of Lead. Barton, L. V. 30,166.
 Mills for Pulverising or Grinding. Brackenbury, G. 30,003.
 Feeding Powdered or Granular Substances. Brackenbury, G. 30,004.
 Collection of Gases in Chambers. Carpenter, C. C. 30,243.
 Soap. Chadbourne, F. G. 29,973.
 Rubber. Davidson, S. C. 29,930.
 Products having Basis of Cellulose Derivatives. Dreyfus, H. 30,216, 30,217, 30,218.
 Plastic Masses. Dreyfus, H. 30,219.
 Organic Derivatives. Dreyfus, H. 30,486.
 Smelting Zinc. Durant, H. T.; and Vautin, C. 30,592.
 Treatment of Emulsions, Etc. Edser, E.; and Minerals Separation, Ltd. 30,341.
 Ferrous Alloys. Edwards, H. O. 30,401.
 Production of Oxides of Nitrogen and Catalyser Therefor. General Chemical Co. 30,090.
 Purifying Liquid Fuel. Giusti, T. 30,200.
 Decolorising and Purifying Sugar, Etc. Grant, D. 30,541.
 Refrigerating Apparatus. Griffiths, H. 29,992.
 Neutralising Mineral Oils Treated with Acid. Grisard, G. 30,379.
 Acid-proof and Insulating Materials. Harden, F. J. 30,382.
 Synthetic Production of Nitrogen Compounds. Haynes, T. H.; and Williams, W. M. 30,268.
 Extraction and Refining of Oil. Heyerdahl, P. M. 30,543.
 Manufacture of Catalytic Iron or Catalysts containing Catalytic Iron. Jenkins, H. C.; and Nitro-Fixation Synd. 30,587.
 Removal of Grease and Fatty Matter from Skins. Lamb, M. C. 30,201.
 Manufacture of Blue Water Gas in conjunction with Coal Gas. Lowe, J. 30,117.
 Separating Aqueous, Etc., Vapours from Fluids and Solids, and for Preparing Dilute Sulphuric Acid. Maass, O. 30,177.
 Cocks to Prevent Use of Gases, Vapours, or Liquids. Mitchell, F. A. 30,553.
 Cellulose Compounds. Müller, R. 29,959.
 Treatment of Sewage Sludge. Mumford, G. 30,579.
 Fixation of Nitrogen. Parkes, H. C.; and Pearson, R. 30,082.
 Grinding and Crushing Mills. Parkes, Ltd., Z.; and Sharpe, L. 30,307.
 Liquid Sulphurous Acid from Dilute Sulphurous Acid Gas. Pascal, P. 30,075.
 Silica Gels. Patrick, W. A. 30,611.
 Treatment of Wool-scouring, Etc., Liquors for Recovery of Potassium, Etc., Salts Therefrom. Radcliffe, A. H. 30,011.
 Preparation of Pure Alkaline Aluminates. Rochette Frères. 30,132.
 Substitute for Ebonite and Vulcanite. Schauerman, F. L. 30,469.
 Treatment of Hydrocarbon Minerals for Extraction and Purification of their Volatiles and Utilisation of their By-products. Shedlock, J. J. 30,240.
 Gasification of Volatile Hydrocarbons and Liquid and Liquefiable Fuel. Smith, T. B. 30,426.
 Treating Sulphide Ores by Dissolution and Selection through Medium of Neutral Solution of Ferric Chloride, Etc. Soc. Anon. Minerais et Métaux. 30,235.
 Oxidation of Ammonia. Toniolo, C. 29,982.
 Treatment of Petroleum, Etc. White, W. C. 30,070.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

The numbers in heavy type are those under which the Specifications will be printed and abridged and all subsequent proceedings will be taken.

1917.

Soap. Thibaud et Cie, P. 822. **106,085**
 Continuous Rectification of Alcohols. Barbet et Fils et Cie, E. 9,659. **107,975**

1918.

Continuous and Uniform Treatment of Hydrocarbons with Sulphurous Acid. Allgemeine Ges für Chemische Industrie. 6,067. **114,845**
 Concentrating Nitric Acid. Marks, E. C. R. (Du Pont de Nemours and Co., E. I.). 14,522. **135,535**
 Potassium Sulphate. Dutt, E. E.; and Dutt, P. C. 17,079. **135,545**
 Refrigerating. Apeldoorsche Machinefabriek en Metaalgieterij voorheen Loog Landaal. 19,084. **120,923**
 Freezing Media. Instone, A. J. 19,244. **135,567**
 Treatment of Coal, Water, or Other Gases, and the Removal of Substances Contained Therein. Pennington, A. J.; and Lamb, M. C. 19,386. **135,577**
 Treatment of Cellulose-containing Materials. Testrup, N.; and Wet-carbonising, Ltd. 19,589. **135,578**
 Filaments for Electric Lamps. Westinghouse Lamp Co. 19,595. **121,596**

1919.

Treatment of Residues Containing Carbohydrates. Effront, J.; and Boidin, A. 131. **122,405**
 Alloys of Copper, Zinc, and Lead. Arend, J. P. 2,495. **135,702**
 Recovery of Potassium in the Form of Nitrate from the Waste Gases of Cement Kilns and the Like. Fairbrother, H. (Chemical Construction Co.). 4,255. **135,713**

Recovering Potassium Compounds. Fairbrother, H. (Chemical Construction Co.). 4,563. **135,720**
 Material for Strengthening and Increasing the Luminosity of Incandescent Gas Mantles. Pope, H. 15,939. **135,797**
 Smokeless Powders. Blyth, E. H. 21,217. **135,813**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1918.

Charging Material to Electro-osmotic Apparatus for Removing Liquids from Substances. Elektro-Osmose Akt.-Ges. (Graf Schwerin Ges.). 10,455. **135,815**
 Electrodes for Electro-osmotic Processes. Elektro-Osmose Akt.-Ges. (Graf Schwerin Ges.). 10,454. **135,816**
 Electro-osmotic Process for Removing Water from Materials. Elektro-Osmose Akt.-Ges. (Graf Schwerin Ges.). 10,455, 10,457, 10,458, and 10,459. **135,817-18-19-20**

1919.

Soda. Nishigawa, T. 28,590. **135,831**
 Treatment of Fine Ores. Dorr Co. 29,302. **135,844**
 Granulating Calcareous Cyanamide to enable it to be Employed as an Ammonia-potassic Fertiliser. Saves, P. 29,378. **135,847**
 Conversion of Hydrocarbons. Fleming, R. 29,490. **135,854**
 Condensing and Treating Distillates. Fleming, R. 29,491. **135,855**
 Grinding or Like Machines. Arter, W. 29,492. **135,856**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Lead Sulphate. S. B. Wilson and Purex, Ltd., Greenford, Middlesex. British Patent, 133,367, of 1918.

In a process of the kind in which galena is vaporised on a bed of fuel and burnt with an excess of air in a combustion chamber, the air inlets are of channel-iron and open downwards. In the apparatus shown, one inlet 12 is disposed in

the neck of the producer, and another 11¹ under the neck. Each is provided with a slide 13 to regulate the air admission. The top and front of the combustion-chamber are preferably water-cooled. The air inlets are preferably controlled from the top of the producer.

Concentrating Ores. E. C. R. Marks, London. (A communication from Luckenbach Processes Incorporated, San Francisco, U.S.A.) British Patent, 133,277, of 1918.

In the concentration of ores by flotation, rubber is used as a mineral-selective agent. The rubber is dissolved in a hydrocarbon or other solvent—for example, "near-turpentine,"—and may be used along with a frothing-agent, such as that obtained from greasewood as described in Specification 133,498, the two agents being added to the pulp separately or previously mixed. In some cases the rubber, instead of being first dissolved, may be cut into small pieces and mixed with a solvent, and used in that condition in the flotation process.

Titanium Compounds. H. Wrigley, H. Spence, and P. Spence and Sons, Manchester. British Patent, 133,336, of 1917.

Ilmenite is treated with sulphuric acid, with the employment of open steam, so that the strength and concentration of the solution can be regulated. The ilmenite may be greatly in excess, the undissolved residue being employed again. The solutions may be employed as such, or may be reduced by means of metallic iron, until the titanium dioxide is reduced

to sesquioxide. The hydrated ferrous sulphate is separated by crystallisation. A proportion of other suitable acids—for example, hydrochloric, hydrofluoric, or oxalic—may be added to the titanium sulphate; or salts may be obtained therefrom by double decomposition with suitable salts.

Furnaces. E. T. Goldthorpe, Chicago, U.S.A. British Patent, 133,236, of 1919.

In connection with a roasting furnace having an inclined track, along which cylindrical ore containers roll, means are provided at the lower end of the track for receiving and discharging the containers. In the construction shown, the inclined track 18 for the containers 22 is mounted above an inclined grate 11, in connection with which are provided a number of fire-doors 12 and ash-doors 13. The products of combustion are exhausted to the stack 14 through openings 17 and branch flues 16, 15. Near the lower end of the track is a removable stop 26 which can be inserted in position to hold the whole of the containers, with the exception of the

lowermost, from moving when the door 20 is raised. The containers are received in turn on a tilting support 30, and are secured thereon by clamps 33. A removable end cap is then withdrawn, and the support 30 is tilted about the axis 31 by operation of a foot-lever 35, to discharge the contents of the container down a shoot 36 leading to a screw conveyer passing through a water jacket 39. In starting the furnace a temporary stop is used, and is gradually moved down the track as more containers are added. The furnace described is more particularly adapted for roasting yellow ochre for use as a body for black paint, which is prepared by mixing 50 parts of the ground material with 48 parts of linseed oil and 2 parts of turpentine.

Calcium Carbide. F. M. Becket, Niagara Falls, U.S.A. British Patent, 133,354, of 1918.

Aggregates for the manufacture of carbide are made by mixing lime with carbonaceous material, such as bituminous coal or peat, and transporting the mixture through a furnace, without agitation, during the coking. Preferably, the lime is produced by burning chalk as a preliminary part of the

process, and is added while still hot to the bituminous material. Lime from the rotary kiln 1 passes through crushing rollers 4 to the mixing-conveyer 7, and carbonaceous material in suitable proportion is supplied through the hopper 8. The mixture is transported in shallow receptacles 9 through a chamber 6, which is heated by burners 10.

Cellulose Acetates. H. Dreyfus, London. British Patent, 133,353, of 1918.

Cellulose acetate compositions for use in making dopes, films, celluloid, artificial silk, etc., contain, as solvents or plastifying-agents, *o*-toluenemonoethylsulphonamide, or the liquid mixtures which are mainly *o*-toluene monomethyl or *o*-toluenemonoethylsulphonamides, but contain also some *p*-bodies, and are prepared from commercial toluene by ordinary methods, such as by treatment with chlorosulphonic

acid to obtain sulphochlorides, which are treated with amines or with ammonia, and afterwards methylated or ethylated. Triphenylphosphate, tricresylphosphate, and aliphatic derivatives of urea, such as are described in Specification 132,283, may be added.

Clarifying Lubricating Oils. M. J. Helmes, London. British Patent, 133,415, of 1918.

Used lubricating-oils are clarified by heating and agitating a mixture with water in a number of reclaiming-vessels A, any or all of which can be put into action at one time. The preferred apparatus comprises: (1) A compressed-air plant D consisting of a motor D², a pump D², and a reservoir D¹ with a delivery pipe D⁴ having branches connected through valves F to the impure-oil containers A¹ within the jacketing-vessels A; (2) a hot-water circulating system C consisting of gas-heated boilers C¹ and a tank C² with delivery and return pipes C³, C⁴ to and from the jackets A; (3) two or more pairs of reclaiming-vessels each consisting of an impure-oil container A¹ with a pipe connection B¹ to a clarified-oil reservoir B, and of a jacketing-vessel A having a valved connection E to its container A¹ and a drain H and a water overflow pipe L to the drain H. In practice, the oil in one pair of containers A¹ is heated by circulation of water in the jacket A, and water and

air are admitted by opening the valves E, F; after treatment has proceeded for a suitable time, the air and water are cut off, the liquid allowed to settle, and the oil layer forced through the pipe B¹ by admission of more water through the valve E. The impurities are run off through the drain H by opening valve J. The compressed-air and hot-water circulating systems are used continuously by treating oil in other pairs of containers when not required for any particular pair. The complete self-contained apparatus described may be built on a motor or trailer so as to be readily portable. The water-circulating system or the compressed-air apparatus described may be dispensed with in places where such apparatus is already available. Injected steam may be used to effect both heating and agitation; or the agitation may be by beaters and the heating by any convenient means, and a suitable coagulant or clarifier may be added to the liquid in the containers A¹.

Coating Metals With Lead. R. W. Thompson, Leith; and J. Morrison, Saltcoats, Ayr. British Patent, 133,179, of 1919.

In a process of coating metals with lead or its alloys, such as a lead-antimony alloy, the article, preferably heated, is coated with a flux consisting of salammuniac, hydrochloric acid, and zinc, and the molten lead, etc., is applied, for example, by dipping, pouring on, or casting, without tinning the surface of the article. The flux may be used as a solution, or it may be evaporated to dryness and used in a molten condition or in the form of sticks, blocks, or powder, or rendered fluid by mixing with hydrochloric acid and zinc.

TARRED ROADS DANGERS.—At the request of the Ministry of Transport, the County Surveyors' Society has appointed a committee to investigate the cause of the numerous complaints as to the slippery condition of certain roads surfaced with tar, tar compounds, and asphalt. Any suggestions which may be thought to be helpful to the committee are invited, and communications should be addressed to the Chief Engineer, Ministry of Transport (Roads Department), 6, Whitehall Gardens, London, S.W. 1.

CORRESPONDENCE.

** * We do not hold ourselves responsible for the opinions expressed by our correspondents.*

Patent Office Library.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Will you kindly draw the attention of your readers to the accompanying copy of a petition asking the President of the Board of Trade to have the Patent Office Library kept open until 10 p.m. daily? The petition has the approval of a number of scientific and technical societies, and I shall be glad to forward sheets, for signature by any others who are interested, as also to hear from individuals who wish their names added but have not an opportunity of signing in person.—Yours, etc.,

CHAS. SALTER,

33, Park Hall Road, E. Finchley, N. 2.

December 3, 1919.

[COPY.]

London, December, 1919.

To the Right Honourable the President of the Board of Trade.

We, the undersigned, beg to ask that you will authorise the Patent Office Library to be reopened to the public until 10 p.m. daily, as was the practice for over twenty-five years before the war—viz., from about 1888 to 1914.

The Patent Office Library, which is maintained from national funds, is acknowledged to contain the most valuable collection of current and other technical literature in this country, if not in the world, and is consulted daily by a large number of readers. Unfortunately the hour for closing prevents the fullest use of the Library being made by many readers who are engaged during the day-time in chemical, engineering, and other technical works, in the outskirts; and these readers are therefore deprived of access to information that they cannot obtain elsewhere.

We are aware that it has now been decided to open the Library until 8 p.m. from the 1st instant, but we believe that, in making this proposal, the authorities of the Patent Office have not fully appreciated the position of the aforesaid readers, who cannot reach the Library until a comparatively late hour. Moreover, these readers belong to a class that should be specially encouraged at the present time, when there is great need for improvement in the technical condition of our industries; and to exclude them from the sources of information contained in the Patent Office Library is, therefore, adverse to the national interest.

Consequently, we venture to hope that you will recognise our request as reasonable and well founded, and will take the necessary action to give it effect.

Waste-heat Boilers.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Referring to the article in your issue of November 29 by Mr. Harald Nielsen on "Heat Economy in Chemical Plants," we cannot but consider that due justice has not been paid to the virtues of the exhaust-heat boiler.

In the first place, Mr. Nielsen is unduly pessimistic in his statement that, unless the gas engine is of at least 500B.H.P., it does not pay to instal a boiler. If we take an engine of half this power, say 250B.H.P., it will be found that the total amount of steam which can be generated by a suitable boiler on a basis of 2,350 hours per annum is 1,175,000lb., representing, say, 65 tons of coal, the value of which can be taken as £117—more than 50 per cent. of the capital expense incurred in installing the boiler.

In many plants there is a need for a comparatively small volume of steam for producer work and for auxiliary purposes, and when a separate boiler has to be put down, in addition to the cost of fuel, we have to add the cost of firemen, which is not required in the case of the exhaust-heat boiler. This, we consider, clearly shows that on 250B.H.P. considerable economy can be effected by the installation of one of these boilers; in fact, we recommend them down to as low as 100B.H.P.

Mr. Nielsen rightly points out that excessive corrosion may be expected if the exhaust gases are cooled down in the boiler to 120° C., but it is very seldom in actual practice that the temperature of the gases at the outlet end of the boiler is below 170° C., which figure is perfectly safe.

Many of this type of boiler manufactured by us have been working for a number of years without any trouble whatsoever.—Yours, etc.,

RUSTON & HORNSBY, LTD.

Lincoln, Dec. 9, 1919.

NEW COMPANIES.

British Cottonseed Products, Ltd.—Capital £250,000., £1. shares. Registered office: Dashwood House, New Broad street, E.C.

Petroleum Oil Trust, Ltd.—Capital £100., 10s. shares. Registered office: 17, Farringdon Avenue, E.C.

Petroleum Power Investment Corporation, Ltd.—Capital £1,000,000., in 999,800 ordinary and 200 management shares of £1. each. Object: To establish or finance oil and other undertakings, etc. Solicitors: Parker, Garrett and Co., St. Michael's Rectory, Cornhill, E.C.

Santa Maria Consolidated Oil Fields, Ltd.—Capital £500,000., 8s. shares. Registered office: Winchester House, E.C.

Dopshine, Ltd.—Private company. Capital £50,000., in 25,000 preference shares of £1. each and 50,000 ordinary shares of 1s. each. Object: To carry on the business of manufacturers, agents for and dealers in all kinds of liquid and solid colours, dyes, paints, varnish, etc. Registered office: 42, Danes Inn House, 265, Strand, W.C. 2.

Granville Perfumery Company, Ltd.—Private company. Capital £1,000., £1. shares. Solicitors: Judge and Priestley, 3, Liverpool Street, E.C.

Honduras Trust, Ltd.—Private company. Capital £43,000., in 40,000 shares of £1. each and 60,000 shares of 1s. each. Object: To acquire, work, and turn to account any petroleum, asphalt, naphthalene, coal or oil-bearing lands, etc. Solicitors: Francis and Johnson, 19, Gt. Winchester Street, E.C.

Sunbeam Products, Ltd.—Private company. Capital £5,000., £1. shares. Manufacturing chemists, manufacturers of metal, boot, furniture, floor, and motor-body polishes, etc. Office: Arcturus Works, Queen's Road, Battersea, S.W. 8.

Tyneside Pure Products Company, Ltd.—Private company. Capital £300,000., £1. shares. Produce manufacturers and manufacturing chemists. Office: 26, Mosley Street, Newcastle-on-Tyne.

Western Counties Clay Company, Ltd.—Private company. Capital £30,000., £1. shares. Producers or manufacturers of and dealers in china clay, china stone, etc. Registered office: Masonic Buildings, South Street, St. Austell.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W.1, whence, unless otherwise stated, further information may be obtained:—

British India.

H.M. Trade Commissioner in India reports that a Calcutta firm, trading solely in Ceylon, are anxious to secure the representation of a British manufacturer of small refrigerating plants suitable for operation on up-country estates. (Reference No. 1142.)

Belgium.

A Belgian inquirer at Liège desires to represent United Kingdom firms manufacturing soap and perfumes. (Reference No. 1159.)

Italy.

An Italian firm, resident in Milan, desire to represent manufacturers in the United Kingdom for the sale of dyes and colours, leather, paints, varnishes and oils. (Reference No. 1163.)

Netherlands.

H.M. Consul-General at Rotterdam reports the receipt of the following inquiry: A Dutch merchant in Amsterdam desires to secure the representation of United Kingdom firms dealing in metals, including copper, tin, zinc, aluminium in finished forms, and galvanised steel sheets. (Reference No. 1165.)

Palestine.

A commission agent in Jaffa desires to obtain the representation of British manufacturers and exporters of paint and varnish. (Reference No. 1171.)

Brazil.

An Italian firm, well recommended by H.M. Consular Officer in Porto Alegre and the British Chamber of Commerce of Sao Paulo, are desirous of being placed in touch with British manufacturers of paints. The firm are also desirous of obtaining raw material for their metallurgical factory, such as sheets and wire of white metal, yellow metal, copper, zinc, etc., with a view to direct importation. (Reference No. 1174.)

H.M. Consul at Porto Alegre reports that a Brazilian commission agent of good standing wishes to represent, on a commission basis, British manufacturers of tinplates, drugs, and chemicals. (Reference No. 1175.)

GAZETTE NEWS.**MORTGAGES AND CHARGES.**

Besglos Polish Company, Ltd., Burnley.—Registered November 6, £500. mort., to Borough Land and Building Society Ltd, Burnley; charged on land in Roebuck Street, Burnley, and hall, buildings and fixtures thereon.

Consolidated Mines of Cornwall, Ltd., London, E.C.—Reg. November 17, £34,000. debts.; general charge.

Sozon Oil Company, Ltd., Manchester.—Registered November 20, £500. 1st mort. deb., to J. G. Grogan, 102, Alexandra Road, Manchester; general charge.

Welsh Silica Company, Ltd., Connahs Quay.—Registered November 18, £4,500. debts. (filed under sec. 93 (3) of the Companies (Consolidation) Act, 1908), present issue £1,750; general charge. May 15, 1918.

Wessex Rubber Company, Ltd., London, E.C.—Registered November 20, £1,000. debts. part of £10,000.; general charge.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Bissee Tin Smelting and Arsenic Company, Ltd.—Claims to R. B. Petre, 11, Ironmonger Lane, E.C., C.A., liqr., by January 9.

Casper Oil and Exploration Company, Ltd.—Resolved November 3, confirmed November 27:—That the company be wound up. A. E. Orbell, 151, North Street, Brighton, liqr. Meeting of creditors at liqr.'s, December 15, at 3 p.m. (The notice of meeting is issued to comply with the requirements of the Companies Acts.)

Oxygen Trading Company, Ltd.—Resolved November 6:—That the company be wound up. J. H. Clarke, liqr.

United Gas Mantle Company, Ltd.—Resolved November 6:—That the company be wound up. A. W. Griffiths, 52, Queen Victoria Street, E.C., liqr. Meeting of creditors, 286, Salisbury House, London Wall, E.C., December 6.

Wohlfahrt Lead Mines, Ltd., London, S.W.—Resolved November 3, confirmed November 20: That the company be wound up. P. A. Strachley and J. D. A. Norris, two of the directors, joint liqrs.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Pratt and King (Adrian Ernest Pratt and Jno. Herbert King), 48, Colton Street, Leicester, oil merchants and composition manufacturers, October 31. Debts by J. H. King. (November 28.)

MARKET REPORTS.**TAR AND AMMONIA PRODUCTS.****WEDNESDAY.**

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d., naked; pure, 3s., naked at works. **Carbolic acid,** crude, 60%, East and West Coast, nominally 2s. 3d. to 2s. 4d.; crystals, 39-40%, 10d., f.o.b. **Crude tar,** London, 50s. to 55s.; Midlands, 50s., North, 50s. per ton, ex works. **Refined tar** 35s. per barrel. **Pitch,** 87s. to 90s.; East Coast, 77s. 6d. to 80s.; f.o.b.; West Coast, 72s. 6d. to 75s. f.a.s. **Solvent naphtha,** naked, London, 90-190%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 95-160%, naked, London, 2s. 9d. to 2s. 10d.; North, 2s. 8d. to 2s. 9d. **Crude naphtha,** naked, 30%, 9d.; North, 8d. to 8½d. **Refined naphthaline,** £18. to £22.; salts, £6. to £7. **Toluol,** naked, London, 2s. 6d.; North, 2s. 5d. **Creosote,** naked, London, 6½d.; North, 6d. to 6½d.; heavy oil, 6½d. **Anthracene,** 40-45%, 7d. per unit. **Cresylic acid,** 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 7d. to 2s. 8d., ex works, London, and f.o.b. other ports. **Sulphate of ammonia:** home trade, December, £21., basis 24½%. **Nitrate of soda,** £22. 10s. to £22. 15s.

FERTILISER MATERIALS. LIVERPOOL, THURSDAY.

Nitrate of soda is firmer, and the quotation on spot for 95-96% quality has been advanced to £20. 17s. 6d. per ton, net cash, f.o.r., prompt delivery. **East Indian bone meal** for shipment is without alteration, the quotation for January-March shipment being £15. per ton, net cash, ex ship Liverpool, for 4½% ammonia and 52% phosphates. **Mineral Phosphates:** There is no change in this material, and values at present are only nominal. **Dried blood** continues scarce, and full prices are being paid for any parcels offering, the value being about 35s. per unit of ammonia per ton, net cash.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on December 6 were: American, 27,407 barrels, compared with 2,701 barrels at the corresponding date of 1918; French, 704 barrels (1,284 barrels); and Spanish, 297 barrels (1,000 barrels). Deliveries during the week ended December 6 were 1,866 barrels, against 343 barrels last year, and since January 1, 71,367 barrels, compared with 24,432 barrels in 1918. The price on Saturday last was 128s. 6d. per cwt., compared with 105s. at the corresponding date of last year. January-April (1920) was quoted at 131s., and May-August, 118s.

LONDON METAL MARKET.**THURSDAY.**

Copper: Standard brands, £101. to £101. 5s., cash; £102. 10s. to £102. 15s., three months; electrolytic, £110. to £112. **Tin:** Standard, £306. 10s. to £306. 15s., cash; £308. to £308. 5s., three months; Straits, £306. 15s.; English, £304. to £305. **Lead:** Soft foreign, £40. 5s.; English, £41. 10s. **Spelter,** £53.; hard, £37. to £39. **Antimony** English regulus, 90%, £47. 10s. **Aluminium,** £150. **Nickel,** £215., ex warehouse. **Quicksilver,** £24. **Bismuth,** 12s. 6d. **Platinum,** 502s. per oz. **Wolfram,** 32s. 6d. per unit.

SWANSEA MARKET REPORT.**THURSDAY.**

Prices of tinplates steady, on the basis of 46s. 3d. per standard box, f.o.b. **Copper** active, with advance in prices; prompt, £101. 10s., and three months, £103. 2s. 6d. **Tin,** £304. 5s. prompt, and £305. 10s. three months. **Lead** selling well: Spanish, £40. 10s. per ton, over next month; English, £41. 10s. **Spelter,** £53. 7s. 6d. **Zinc** sheets firm, with English at £72. per ton, including delivery; American, £60., f.o.b., New York. **Antimony:** English regulus, £47. 10s.; Chinese, £44. 10s. **Quicksilver,** £25. 10s. per bottle. **Silver,** 75d. per ounce. **Aluminium,** £150. **Nickel,** £215., f.o.b. **Sulphate** of copper small export trade at £41. per ton, f.o.b. **Sulphate** of ammonia very steady at £21. to £22. per ton, over next six months. **Nitrate of soda** firm; ordinary to refined, 21s. to 22s. per cwt., in bags. **Turpentine,** £6. 10s. 6d. per cwt. net. **Arsenic** in improved demand, with white powdered at £63. 5s. per ton, in bags. **Oxalic acid** quiet, at 1s. 2½d. per lb. **Pitch** scarce and dearer at 72s. 6d. per ton.

MANCHESTER CHEMICAL MARKET.**THURSDAY.**

There is continued strong activity in all branches of the chemical trade, and makers are well engaged with orders. Prices generally have an upward tendency owing to increasing costs of labour and raw material, and there is not much disposition to book forward business. **Resale** parcels of caustic soda, bicarbonate of soda, and 58% alkali are very scarce owing to strong export demand, and prices are being offered much in excess of current values for home buyers. **Bleaching** powder unchanged, at £17., softwoods, on rail; and £15. 15s., delivered, for January-June contracts. **Chlorates** are quiet at recent rates. **Saltcake** unchanged at 70s. per ton, carriage paid. **Caustic soda ash,** 48%, higher at £12. per ton.

Recovered rock sulphur, bulk, £17. per ton. There is no sign of improvement in copper sulphate, and price remains nominal at £41., f.o.b. Phosphate of soda has advanced to £32. per ton, delivered. Concentrated sodium sulphide, casks, £25. 10s. per ton. Nitrite of soda, £62. per ton. White powdered arsenic in better supply, but price firm at £65. per ton. Yellow prussiate of potash unchanged at 2s. 1d. and soda 1s. 0½d. per lb. Acetic acid has an upward tendency. Acetate of soda higher, at £50. per ton. Lead salts are firm: English white acetate, at £84.; brown, £67.; and nitrate, £56. per ton. English brown acetate of lime firm at £15. per ton; grey higher, at £25. per ton. Acetone, in quantity, £90. per ton. Miscible wood naphtha, 10s. 6d. per gallon. Oxalic acid steady, at 1s. 5d. per lb., but only small business doing.

LIVERPOOL CHEMICAL MARKET.**THURSDAY.**

Inquiries for chemicals have again been made very freely and have maintained an agreeable degree of activity in the chemical market. More inquiries have come from the export branch of the trade, and in the home branch much business has been done on 1920 account. Stocks at local works, over and above what is wanted for running contracts, are reported to be very limited.

Bleaching powder has again been in good request, but in small supply, for early deliveries on fresh buyings or contracts; quotations are £17. per ton, free on rail or conveyance, in buyers' packages, for the home trade, and £15. to £18. per ton for export. Chloride of calcium has been quieter; prices are from £8. to £11. per ton, in casks, f.o.r. Caustic soda has had a rather brisk inquiry, and is £24. per ton for 76%; £22. per ton for 70—72%; and £21. per ton for 60%. Nitrate of soda has been in fair request, and the price is easier; it is £21. to £22. per ton. Saltcake has sold more freely, and is £7. 15s. per ton, in casks, f.o.b. Soda crystals have been more inquired for, and are £5. 10s. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been in good request, and is £8. 5s. to £10. per ton, according to terms of delivery. Borax has been in very fair demand; prices are £39. per ton for ordinary, and £40. per ton for powdered, in bags, less 3%, for lots of not less than 50 tons. Ammonia alkali has been freely inquired for, and is still in limited supply at works; prices are £6. 10s. to £6. 15s. per ton, f.o.r. Hyposulphite has received more attention; it is £18. 10s. per ton for ordinary, and £22. per ton for pea crystals, in 1cwt. kegs. Sulphite of sodium has been but little in request; it is £11. per ton for ordinary, and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been quieter, and is £22. per ton, in barrels, and £23. 10s. per ton, in drums. Prussiate of soda has again been quiet, and is 1s. to 1s. 0½d. per lb. Bichromate of soda has had a moderate sale, and is 10d. per lb. Phosphate of soda has been in quietly steady demand, and is £30. per ton. Chlorate of potash has had a limited sale, and is 1s. to 1s. 1d. per lb. Permanganate has been quiet, and is 3s. 6d. per lb. Sulphate of potash has moved but slowly, and is £25. per ton. Carbonate of potash has sold more freely, and is £95. to £100. per ton, for 80—85%. Caustic potash has had a rather brisk inquiry, and is £120. per ton. Nitrate of potash has been more in request, and is £60. to £62. per ton for refined, and £40. per ton for ordinary. Canadian potashes have been very quiet; Montreal first quality are £200. to £220. per ton, and second quality £190. to £210. per ton. Bichromate of potash has been but little in demand, and is 1s. 6d. to

1s. 7d. per lb. Yellow prussiate of potash has been steadily called for, and is 1s. 10d. to 2s. 2d. per lb. Sal ammoniac has been in very fair demand, and is £95. per ton for first quality, lump; £90. per ton for second quality, and £5. per ton extra for crushed. Sulphate of ammonia has been more inquired for, and stocks available for early deliveries are still small; prices are, for December, £21. per ton; for January, 1920, £21. 7s. 6d. per ton; for February, £21. 15s., and for March to May, 1920, £22. per ton. Carbonate of ammonia has moved more freely, and is 7½d. per lb. Muriate has been inactive, and is £45. to £50. per ton, according to grade. Magnesia has been rather more in demand. Carbonate is £2. 5s. per cwt., and sulphate £11. to £16. per ton, according to grade. Alum has been in moderately active demand, but supplies available for early deliveries have been very limited; for home trade uses £18. 10s. per ton is asked, and for export £18. 10s. to £19. 10s. per ton. Aluminoferric has been but little called for, and is £8. 10s. to £12. per ton. Sulphate of alumina has been quiet, and is £12. to £17. per ton, according to grade. Sulphur continues to be well inquired for; English flowers are £32 per ton; roll is £28. per ton; and rock £22. per ton, in bags, f.o.r. In Sicilian, flowers are £28. per ton; roll is £22. 10s. per ton, and rock £17. 15s. per ton. Cream of tartar has been in very fair request, and is £12. 10s. to £13. per cwt., according to test. Tartaric acid has been in quietly steady demand, and is 3s. 2d. to 3s. 3d. per lb. Boracic acid has been steadily called for, and is £72. per ton for crystals, £74. per ton for powdered, and £2. to £3. more in casks. Oxalic acid has met with a fair inquiry, and is 1s. 3d. per lb. Citric acid has sold more readily, and is 4s. 3d. per lb. White acetate of lead has been inactive, and is £84. to £85. per ton. Arsenic has sold rather more freely, and is £65. per ton for white powdered. Sulphate of copper has been but little in request, and prices have shown a tendency to ease. For the home trade £41. is being quoted, and for export £41. to £42. per ton, less 5%, in casks, f.o.b., at Liverpool.

TYNE CHEMICAL REPORT.**TUESDAY.**

The demand on the part of both home and export is active, and prices continue very firm, caustic soda and bleaching powder being in good inquiry. Soda crystals are still scarce and firm at £5. 10s. per ton, 2cwt. bags, locally. Recovered sulphur firm at £23. to £24. per ton.

The following prices are per ton, net: Bleaching powder, softs and hards, £17.; caustic soda, 76-77%, £26.; do., 74-76%, £25.; do., 70%, £23.; do., 60%, £21.; recovered sulphur, 2cwt. bags, £24.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda (salt-cake), in bulk, £4. 10s.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market is exceptionally firm and the pressure for supplies is keen and business far in excess of probable output. To-day's quotations for export: Best Northumbrian steam, 95s. to 100s. per ton; do., second qualities, 90s. to 94s.; Northumberland small coal, 75s. to 80s.; do., seconds, 70s. to 72s. 6d.; best Durham gas coals, 80s. to 85s.; do., seconds, 70s. to 75s.; Durham bunker coal, 70s. to 80s.; do., seconds, 60s. to 65s.; foundry coke, 100s.; gas coke, 95s.

AMMONIUM CHLOROHYDRATE—

Rio de Janeiro, 1 cs., £7.

AMMONIUM CHLORIDE—

Calcutta, 1 cs. (pt.), £9.

AMMONIUM NITRATE—

Cochin, 10 t., £360.; Pointe-a-
Pitre, 116 t. 3 c., £3,500.

AMMONIUM SULPHATE—

Channel Islands, 21 t., £431.;
Dunkirk, 340 t., £7,820.

AMYL ACETATE—

Boulogne, 2 drms., £320.; Paris,
10 drms., £685.; Rotterdam,
17 drms., £1,770.

ANTIMONY REGULUS—

Calcutta, 1 t.; Gothenburg,
1 t. 10 c.; Rotterdam, 50 t.

ANTIMONY SULPHIDE—

Antwerp, 8 cks., £158.; Lisbon,
1 ck., £10.

ANTIMONY TARTRATE—

Bombay, 1 cs. (pt.), £8.

ARSENIC—

Lisbon, 12 c., £39.; Rio de
Janeiro, 4 c., £18.; Valencia,
5 t. 8 c., £300.

ARSENIC SULPHIDE—

New York, 10 kgs., £44.

BARIUM HYDRATE—

Boulogne, 47 cks., £314.

BASIC SLAG—

Channel Islands, 35 t., £117.

BENZOIC ACID—

Pelotas (F.), 1 cs. (pt.), £8.

BISMUTH—

Gothenburg, 5 cs., £505.

BISMUTH SUBNITRATE—

Karachi, 13 cs., £958.; Monte
Video, 1 cs. (pt.), £23.; Novoro-
ssisk, 2 cs., £153.

BLEACHING POWDER—

Paris, 10 t. 9 c., £130.

Kobe, 788 t., £16,648.; Yokohama, 106 t., £10,309.

CAUSTIC SODA

Kobe, 50 t., £770.; Yokohama, 50 t., £770.

CHEMICALS (otherwise undescribed)

Calcutta, 7 t., £107.

COAL PRODUCTS

Benzole

Rotterdam, 25,865 gals., £6,548.

Carbolic Acid

Antwerp, 6 t., £446.

Naphthalene

Rouen, 22,000 gals., £2,152.

PITCH

Antwerp, 585 t., £1,902.; Rouen, 55 t., £2,201.

SALT

Beira, 3 c., £8.; Durban, 7 t., £338.; Straits, 20 t., £55.; Sumatra, 10 t., £34.

SODIUM BISULPHITE

Belawan, 3 t., £42.

WOOD PRESERVATIVE

Calcut, 10 c., £16.

NEWCASTLE-ON-TYNE

Week ending December 6.

RED LEAD

Bergen, 2 t. 10 c.

N. & S. SHIELDS.

Week ending December 6.

NIL.

SWANSEA.

Week ending December 6.

COPPER SULPHATE

Almeria, 20 t. 19 c., £900.

ZINC OXIDE

Bahia, 5 t. 7 c., £1,780.; Lisbon, 10 c., £43.

ZINC WHITE

Bahia, 4 t. 2 c., £209.

PRICES CURRENT.

THURSDAY, Dec 11, 1919

PREPARED BY MESSRS. HIGGINBOTTOM AND CO, 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified
The prices in different localities may vary.

Acids:—		£ s. d.

WHITLEY COUNCILS.

IN the turmoil of the many industrial disputes of late, not much has been heard of the Whitley Councils. Yet it is a little incongruous to remember that Whitley Councils were brought into existence for the specific object of preventing industrial disputes. A considerable sum of money has been spent on propaganda work, and with a view to obviating overlapping, the Industrial Reconstruction Council has amalgamated with the Industrial League, both bodies carrying out more or less similar work. It is, perhaps, to underrate the work of Whitley Councils to suggest that there has been a period of greatest activity as regards labour unrest since they first came into existence, and we would not by any means suggest that this is cause and effect. The contrary might legitimately be claimed to be the case, for there is little doubt that Whitley Councils have, in many industries, been the means of composing disputes between employers and employees in an amicable manner. It is stated that there are now 53 industries in which Whitley Councils are operating, and admittedly their work has been all to the good. The weakness of them, however, as we have already said in connection with the Industrial Courts Act, is that they are entirely voluntary bodies, with no power to enforce their decisions. It is curious that public attention should only have been drawn to this feature within the last week or so, but the Whitley Councils themselves have recognised the fact long ago, and the employers, at any rate, have not hesitated to express their dissatisfaction at that state of affairs. It lies with the parties, of course, to agree to make their decisions binding so far as they are concerned, but even that is not so easy as it might at first sight appear, unless the whole of a trade—both employers and workpeople—are represented on the committee. That is not often the case; and suppose, for example, a dozen employers are not represented in the trade association, although employing men who are members of the trade union represented on the Whitley Council, how can the Whitley Council enforce its decisions on these employers? Ironical though it is, the only way would be for the men to strike, and for a strike to be the medium for enforcing the decision of a body constituted primarily to promote industrial peace would, we fancy, be a state of affairs hardly to be found even in a Gilbert and Sullivan opera. Therefore it is clear that if Whitley Councils are to be effective some means must be found for making

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the "Chemical Trade Journal and Chemical Engineer"—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ..	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

their decisions binding. We do not think the suggestion that if 75 per cent. of a trade—both employers and employees—agree, the remaining 25 per cent. should be compelled by legislative enactment, will meet the case. Coercion will never be popular, no matter where it is tried, and as things stand it appears that the first step to be taken is to give full effect to the motto of the late Industrial Reconstruction Council, "Every employer in his trade association; every workman in his union." Given this state of affairs, then it would become an easy matter to make the decisions of a Whitley Council binding, although, even so, no penalty could legally be imposed for infringement. However, that would be an appreciable step forward and might lead the way to some form of legality being given to such decisions.

THE WORK OF THE GOVERNMENT LABORATORY.

THE report of Sir James J. Dobbie on the work of the Government Laboratory for the year ended March 31, 1919, has just been issued. The total number of samples examined in the course of the year, including those dealt with at the outport chemical stations, was 289,180, as compared with 269,118 in the preceding year—an increase of 20,062. The number of samples of beer and brewing materials tested for arsenic was 1,249. Of these eight were found to contain arsenic in excess of the limits suggested by the Royal Commission on Arsenical Poisoning—namely, the equivalent of one hundredth of a grain of arsenious oxide per pound in the case of solids, or per gallon in the case of liquids. Of 205 samples of malt and sugar tested, none contained arsenic in excess of the limits. 966 samples of beer and wort examined were also free from arsenic. The samples in which excess of arsenic was found consisted of salts and solutions proposed to be used for treating brewing waters, but in no case was arsenic in excess of the Royal Commission limits found in samples of beer made with water so treated. Samples of wood naphtha and of mineral naphtha, intended for use in the preparation of methylated spirit, to the number of 765 were examined. The naphtha represented by 743 of these samples was approved as fit for methylating purposes, whilst that represented by the other 22 samples was found to be unsuitable. The number of samples examined again shows a decrease as compared with those of last year, which numbered 877. The decrease is largely due to the current high prices and the consequent falling off in the quantity of "mineralised methylated spirit" used for heating and other purposes. In connection with the use of pure and specially denatured alcohol in manufacturing operations, 192 samples of petroleum, ether, and other denaturing substances have been examined, as well as 22 samples of pure alcohol and 36 samples of specially denatured alcohol. With the object of preventing the illegal use of methylated spirit in making tinctures, essences, perfumes, and medicinal preparations, 25 samples taken from manufacturers and retailers were examined, in addition to those taken under the Export Tincture Regulations. For the purpose of controlling the use of duty-free methylated and other denatured spirit in connection with manufacturing operations, 515 samples of recovered spirit, residues from stills, articles manufactured with industrial spirit, and preparations containing such spirit were examined. More than one thousand papers were dealt with relating to applications received by the Commissioners of Customs and Excise, either (1) in respect of claims for rebate on alcohol used in making medicinal preparations, or (2) in connection with per-

mission to receive methylated spirit and other forms of duty-free alcohol for use in manufactures, tuition, and research. In the former instances advice was required as to whether the claims in question were such as could properly be allowed under Section 4 of the Finance Act, 1918. The other references were sent chiefly for advice as to whether the purposes to which it was proposed to put the alcohol were, from the chemical point of view, such as to justify the granting of the particular indulgence asked for. The imports of matches in 1918-19 though larger than in the previous year, were still much below pre-war level, and only three samples were submitted under the "White Phosphorus Matches Prohibition Act, 1908," in none of which was any evidence of the presence of white phosphorus discovered. Twenty-six samples of sheep dips were received for examination in connection with applications by manufacturers for inclusion of their preparations in the official "Schedule of efficient dips." Before the Board of Agriculture give their approval to any dip they must be satisfied that the formula provides for a sufficient quantity of a recognised active ingredient and that the dip has been made in accordance with the formula. In 15 cases the samples were found to agree with the formulæ, and were of effective strength at the proposed dilution; six were deficient in active ingredients at the dilution submitted by the makers; in the remaining five cases the formulæ required modification to ensure an efficient dip. Four samples of approved dips obtained in different parts of the country were also examined with the object of ascertaining whether the dips as sold or used correspond in composition with the samples which had received the Board's approval. The analyses showed that one of these had not been prepared according to the formulæ previously submitted and approved. In the course of the year numerous matters were submitted by the Board of Agriculture for report. Many of these related to the value of materials supplied as feeding-stuffs, and to the supply of potash and phosphatic manures. The official method for the determination of potash in fertilisers has been revised and a new method drawn up for use in the case of flue dust. The samples taken by the Customs under the Exportation and Importation Prohibition Regulations were of great variety, and included such materials as soap, disinfectants, printing ink, ceramic colours and glazes, lubricants, pitches, rubber solutions, metals, paints, varnishes and ships' compositions, polishes and stains, coal tar oils, metallic capsules, soldering fluxes, waxes, and medicinal preparations and drugs. Most of these were examined to ascertain whether the conditions of the licence for export were complied with. For example, when glycerine was so urgently required for munitions the proportion of glycerine in soap was not allowed to exceed a certain limit, and similarly the proportion of pure carbolic acid or phenol in disinfectants was confined within certain limits. Many of the materials exported had to be examined for one or more constituents, the exportation of which it was desired to restrict, and it was frequently necessary to devise new processes for their determination. The samples under the Fertilisers and Feeding Stuffs Act were submitted by the Board of Agriculture and Fisheries in connection with applications by local authorities for the consent of the Board to proceedings against the sellers. The number of samples received was 11, consisting of five fertilisers and six feeding stuffs, against 20 in the previous year. The fertilisers consisted of superphosphate, basic slag, and sulphate of ammonia.

ELECTROLYTIC FORMATION OF PERCHLORATE FROM CHLORATE.*

By J. GUILFOYLE WILLIAMS, B.Sc. (LOND.), A.I.C.

IN order to convert sodium chlorate into perchlorate electrolytically, the following conditions are laid down by Winteler (*Chem. Zeit.*, 1898, 22, 89): (1) Low temperature at anode (artificial cooling). (2) Acid solution at anode. (3) Current density of 4—12 amps. per dm². (4) High concentration of chlorate. This is given by Allmand as being applied industrially by electrolysing a 60-70 per cent. chlorate solution between an iron cathode and a smooth platinum anode at a temperature of 10° C., this being maintained by cooling coils. The voltage per bath is given as 6.5—7.0 volts, and current density 8amps. per dm². Good liquor circulation is necessary, and the chlorate liquor charged is slightly acid. The resultant current efficiency is about

iron cathode, smooth platinum anode, cooling coil, and efficient liquor mixing arrangements. The current was measured by the ammeter to the series, and the voltages were measured on each bath.

(1) Four baths were filled with chlorate liquor and hourly readings taken of the temperature and amperage. Voltages were taken between the anode and cathode contacts at different periods of the electrolysis. The amount of perchlorate produced was estimated by the fall in chlorate concentration. To eliminate errors due to evaporation the baths were kept filled to a standard level by the addition of distilled water. One ampere is taken as converting 1.986 grammes NaClO₃ to NaClO₄.

The results are given in the following table:—

AMPERES THROUGH BATH.	BATH LIQUOR.					BATH LIQUOR.					BATH LIQUOR.					BATH LIQUOR.				
	Av. Temp. C.	NaCl. g/l.	NaClO ₃ g/l.	% EFF.		Av. Temp. C.	NaCl. g/l.	NaClO ₃ g/l.	% EFF.		Av. Temp. C.	NaCl. g/l.	NaClO ₃ g/l.	% EFF.		Av. Temp. C.	NaCl. g/l.	NaClO ₃ g/l.	% EFF.

*DUE TO ANALYTICAL ERROR.

100 per cent. at first, but it slowly falls, and the average current efficiency is about 85 per cent. For the production of one kilo of perchlorate 3.5K.W.H. is consumed. The oxygen evolved during the later stages of the reaction contains much ozone.

My experience of present-day practice shows that this description requires modification. The temperature of the electrolysis is initially about 30° C., and the current density about 45—50amps. per sq. dm². The solution used is about 600—700 grammes per litre NaClO₃. As the chlorate content falls below about 100 g/l NaClO₃ the resistance of the series of baths increases considerably, and at 50 g/l the current density is about 30amps. per dm² and the liquor temperature about 45°—50° C. Ozone is not given off in appreciable quantities until the chlorate concentration is below 10 g/l; as the chlorate content gets below 5 g/l the smell of the ozone is almost overpowering, and, if breathed much, produces pains and continuous coughing. The liquor charged should certainly not be alkaline to any appreciable degree, but no advantage is served by acidifying the liquor. This will clearly be seen from experimental work below. The current efficiency given by Allmand is a very low one considering the lowness of temperature of his electrolysis. Under normal conditions of electrolysis, as given above, the average efficiency is 85 per cent., or even above.

Experimental.—These experiments were carried out on an industrial type of bath of about 250 litres capacity,

The results given in brackets in the fourth line down represent the chloride values after about another 12,000amps. had passed. The analyses were all routine factory determinations, and so not of abnormal accuracy.

On examination the following facts are evident:—

(a) Up to 60° C. the current efficiency of perchlorate electrolysis does not fall off rapidly. The figure of 85 per cent. for 10° C. given by Allmand is obviously very poor practice. It has been stated that the conversion practically stops at 80° C.; this has not been tested, but the above results do not seem to confirm this.

(b) The factory average for production of 1 kilo of perchlorate was about 3.6K.W.H. Allmand gives 3.5K.W.H. On the above figures it is 3.4K.W.H. at 41.5° C., and 3.0K.W.H. at 59° C. Electrolysis at higher temperatures than at present used gives higher production per unit of energy.

(c) The chloride content of the bath tends towards an equilibrium dependent on the temperature. This is roughly:—

- 2.3 g/l NaCl for 31° C.
- 2.8 g/l NaCl for 41.5° C.
- 3.8 g/l NaCl for 50° C.
- 4.7 g/l NaCl for 59° C.

This probably represents an equilibrium between decomposition of chloric acid at the anode with formation of chloride ions, and elimination of these by this discharge to form hypochlorite ions. The discharge of chloride ions wastes current, and also causes the trouble given below.

*A paper read before the Faraday Society London, on Monday.

(2) Neutral or acid chlorate liquor charged to a bath very quickly becomes alkaline to phenolphthalein. The alkalinity is of the order of 1.0 g/l; it is due to hypochlorite produced by chloride ion discharge and, as will be seen from the above conclusions, it is an inevitable part of the process. The effect of adding acid was tried.

(a) Acid was added to baths—50c.cs. of concentrated acid diluted with water—once a day. Any increase in efficiency would have been detected by the more rapid fall in chlorate content compared with a normal bath. No increase in efficiency was noticeable, and after about two hours the bath again becomes alkaline.

(b) Frequent addition of acid was now tried. Baths at 30° C. and 60° C. were taken, and 10c.cs. of acid (diluted to 100c.cs. with water) added. Below are given the liquor analyses at different periods of the electrolysis:

	Bath Temp.	NaClO ₃ .	NaClO ₃ .	NaClO ₃ .
Acid.....	30	562	23	—
No Acid.....	30	565	26	—
Acid.....	60	567	82	46
No Acid.....	60	565	97	65

At 30° C. the addition of acid seems to have no effect. But at 60° the efficiency was increased by 4.6 per cent.

Conclusion.—The production of perchlorate by electrolysis is considerably improved if a higher temperature of liquor is maintained, and the frequent addition of acid improves still more this efficiency. During electrolysis chloride is produced, and there is an equilibrium value for each temperature.

THE THICKENING OF LINSEED OIL

AN interesting paper on "The Effect of Heating Linseed Oil under Pressure and its Bearing on 'Litho' Oils" was read by Mr. S. Coffey, B.Sc., at a meeting of the Nottingham Section of the Society of Chemical Industry, held at University College, Nottingham, last week.

The author said that the probability that linseed oil polymerises on heating has been shown by Fahrion (*Z. angew. Chem.*, 5, 171, 1892) and Fokin (*Augsb.-Seifens-Ztg.*, 34, 821). Ingle (*J. Soc. Chem. Ind.*, 30, 344, 1911) noted an increase in the density, and a decrease in the hexabromide value and iodine absorption. Morrell showed the presence of a portion insoluble in acetone in oil which had been thickened from 260° to 280° C. Further, Krumbhaar (*Chem. Zeit.*, 40, 937, 1916), who heated the oil for shorter times to higher temperatures, noted increases in viscosities and acid values, but constancy of the saponification value. Friend (*J. Chem. Soc.*, 111, 162, 1917) has also studied some physical constants of oil which had been thickened at various temperatures by Morrell.

The author of the present paper used a somewhat different method of thickening the oil. The samples were heated in a sand bath in sealed tubes, and therefore under pressure for varying periods up to 42 hours. In contradistinction to the results in open vessels, the colour grew lighter instead of darker, and the acrid odour of acrolein did not develop. The drying qualities of the oil were unaltered. The density increases to nearly 0.99 after 42 hours' heating, and the viscosity, as determined by Poiseuille's method, to about 50 times the initial value. The free acid reaches a limit at about 2½ times

the initial value, instead of increasing to 40 times and apparently without limit, as in the open-tube experiments of Krumbhaar. There is a marked increase in the rate of increase of these constants after about 21 hours' heating. After the same time a small portion becomes insoluble in acetone, and this portion rapidly increases on further heating. The unsaturation, as shown by the iodine absorption, diminishes continuously.

The theoretical interpretation of these results is based on the hydrolysis of a portion of the oil by the small amount of water unavoidably present in commercially pure raw oil direct from the presses. The explanation also requires a progressive polymerisation of the acids present in the glycerides, with formation of less saturated di-acids, etc. The differences mentioned above will, on the whole, be those which distinguish the "thin" and "strong" varnishes of the "litho" oil and varnish industries.

THE GOVERNMENT'S NITRATE PLANT.

SPEAKING at the annual dinner of the Association of Managers of Sewage Disposal Works, on Thursday (December 11), Dr. S. Rideal said the Ministry of Munitions Inventions Department had succeeded during the war in obtaining a grant of £4,000,000. from the Treasury to put up a plant for the manufacture of nitrates from the air. A site had been secured, engineers employed to design a plant, and some hundreds of thousands of pounds had been spent on this particular work. Before the expenditure had been sanctioned there had been an understanding that the money would be spent upon works which would be useful not only in war-time but after the war, because there was a shortage of fertilisers for growing our foodstuffs in this country. He was sorry to say, however, that the Government were now advertising what remained of these works for sale; it was really a great shame and a shocking waste of public money. It was being developed on a gigantic scale, and had been thought out by a lot of young chemists, engineers, and the inventive staff of the Ministry of Munitions, trying to imitate the Germans, who relied entirely on this artificial nitrate during the war, because no nitrate could come from Chili, and the Germans did not make any nitrate from sewage. At the time of the French Revolution, 100 years ago, nitrate was made in Paris from sewage and used for explosives purposes. If it could be done 100 years ago it could be done now, but, at any rate, there had been this large wasted expenditure upon the attempt to make nitrates from the atmosphere, which had been abandoned in the manner he had mentioned.

PATENT LAW.—At the annual general meeting of the Inventors' Union in London on Monday, it was decided to ask the Government to consider the creation of an All Empire Patent to replace the present system, which entails an initial outlay of several hundred pounds to secure protection in Great Britain and the Colonies. The following resolution was also passed: "That this Union strenuously opposes the whole of Clause 8 of the Patents and Designs Bill, as from the actual experience of their members the evasion of paying the first inventor and patentee royalties for any invention secretly submitted to or tried by any Government Department is open to the greatest abuse and danger of corruption; and if this clause is passed as drawn, the Union will have to advise all inventors to avoid in future submitting any of their inventions to the Government at all."

THE TRANSPORT AND DISTRIBUTION OF LIQUIDS IN CHEMICAL WORKS.

THE Chemical Engineering Group of the Society of Chemical Industry held its second Conference at Armstrong College, Newcastle-on-Tyne, on Monday, the subject being "The Transport and Distribution of Liquids in Chemical Works." A number of papers were read and discussed.

Professor Henry Louis, D.Sc., who presided at the afternoon session, said his first duty was to welcome the Conference to Newcastle in general and to Armstrong College in particular. He did not need to remind them that Newcastle had been the pioneer of not a few chemical industries in the past, and was still holding its own with most other parts of the country. When the much-needed expansion of the College took place, as he hoped it soon would, he was very anxious that a home should be found for Chemical Engineering, or whatever term they might give the subject. He did not doubt but what the authorities were giving serious attention to the matter. He regretted to say that a telegram had been received from Professor T. W. Hinchley, chairman of the Chemical Engineering Group, stating that it was impossible for him to attend owing to illness, but he wished the gathering every success. The subject selected for the Conference, continued Professor Louis, was one of the greatest importance to everyone connected with chemical engineering. The problem of elevating liquids was one of the oldest the engineers had had to solve. The simple problem of water pumping might be said to have been fairly well solved by mechanical engineers. Chemical engineers, however, had a more difficult problem before them. He was beginning to appreciate that mechanical methods must be introduced into chemical works, which had grown chiefly by the work of chemists themselves, but in some instances—especially in that district—engineering had been conspicuous by its absence. The cost and the scarcity of labour were making it necessary for the chemical engineer and industry generally to employ more and more mechanical methods of doing work, and abandoning what a shipbuilding friend called "man power and profanity." (Laughter.) For the special subject being dealt with by the Conference the need was remarkably conspicuous. The problem had occupied some of the best brains in the country, and the way in which it had been attacked and the measure of success achieved were indicated by the specimens of chemical engineering before them, and would be further elucidated by the papers to be read during the Conference.

The first paper was by Mr. J. Arthur Reavell, M.I.Mech.E., on

"THE ELEVATION OF ACIDS BY THE KESTNER AUTOMATIC ELEVATOR."

Mr. Reavell said the object of the paper was to describe the principles upon which the two standard types of Kestner patent elevators worked. The first consisted of an elevator which worked intermittently. As soon as the elevator body was filled with acid the acid was discharged by means of compressed air. The admission of the compressed air was automatic and was controlled by a patent valve arrangement. The moment the body was filled with acid compressed air was admitted through the valve in the valve box and the acid dis-

charged through the delivery pipe. Immediately the elevator was empty the air inlet valve was closed and the exhaust valve opened, and atmospheric pressure was at once restored. That allowed a further charge of acid to enter the vessel. That type of elevator could be obtained in potware, cast iron, regulus, or, in fact, any material to suit the type of acid to be pumped. The object of the apparatus was to replace the ordinary hand-operated egg.

The other type was the Kestner patent continuous elevator, which delivered a continuous supply of acid against a given head—say, for instance, for the delivery of acid through jets or sprays. That was accomplished by means of a duplex body, each body filling and emptying alternately. The control of the air to the one body and the exhausting of the air from the other was effected by means of a simple device consisting of a rotary valve. The rotary valve was made in potware, and was so arranged that as soon as one body was full of acid compressed air was admitted, so that it immediately commenced discharging and, at the same moment, the other body ceased discharging acid and commenced to refill ready to come into operation.

The automatic elevators, said Mr. Reavell, should not be confused in any way with Kestner pumps either of the plunger or centrifugal type.

Captain C. J. Goodwin, in the course of the discussion, said he would like to ask why, in presenting the paper, Mr. Reavell had not given more useful information as to the actual working results; that was to say, the amount of air used to the cost of the operation. That was a matter of the utmost importance. They were not so much interested in the description of the elevator as they were in the results obtained. He would like to ask Mr. Reavell whether he had tried or whether experiments had been made in using compressed air expansively. He (Captain Goodwin) considered that when it was required to raise only 15ft. or 20ft., and, as was usual, 60ft. or so was the standard pressure, the air supply was not being used economically. Was it not possible to arrange a device on the elevator to use only part of the air, allowing it to act expansively, and so save air? It seemed to him that in the Kestner elevator there would always be a loss at the finish of the blowing period. He would like figures as to the percentages of air lost in that way. He thought that some figures as to cost in £. s. d. of pumping liquids by an acid elevator would be very useful. He was also interested to know how the acid elevator compared with the air-lift in actual practice. His own experience was that air-lifts were very reliable, even though there was a little to give in regard to efficiency.

Mr. Reavell replied that the difficulty in giving the information as to cost would be realised by those dealing with acid works. One could not get the average acid manufacturer to allow tests to be made. The figures in one's own laboratory did not help in the matter. The trouble was that the greatest difficulty was experienced in getting the piping put up right. If the pipes were put up right they would probably get a very high standard of efficiency with the use of compressed air. When the pipes were put up horizontally one was certain to get a loss of air. Regarding the differences of pressure required and available, one started at zero, and when the balance pressure was reached the pressure slightly increased by about 10 per cent. Because there was 80 per cent. available to come on to the valve, 80 per cent. was not delivered, but just sufficient according to the rate pumped. A reducing valve was not needed in his opinion. The acid elevator should not be filled slowly, but quickly, to get quick motion. In any type tried, one would get a certain loss of air.

Captain Goodwin asked if that was why they liked to pre-heat the air.

Mr. Reavell replied that that was so. With regard to the air-lift and the acid elevator, as one of the first to introduce

the Bacon air-lift from America, he thought there was no comparison in efficiency. That was his experience.

Mr. S. J. Tungay said that a difficulty had always been in the fact that the engineering side did not meet the demands of the chemists. Twenty or thirty years ago it would have been impossible to get such articles manufactured as were seen there that day. As a matter of interest, he added that 15 years ago he had seen centrifugal pumps made of stone. Despite the criticism of the old methods of pumping acid, he thought there was still a great deal to be said for them. He had not adopted the Kestner or similar types. One reason was that whatever the men were in other parts of the country, his experience was that to-day they were not willing to do the work of replacing the various parts. The plumbers objected to coming out specially to a job, and insisted that plumbers should be kept on the place at all times.

Mr. Reavell said that they had a simple arrangement which ensured that there was absolutely no waste by splashing. With regard to the question as to whether the delivery pipe was exhausted every time, he replied that when the pipes were put in right there was no trouble whatever. Regarding the ability of the plumber to deal with the valve, he really thought it was not asking too much even of the modern plumber. (Laughter.)

Mr. R. A. Pelmore, B.Sc., then read a paper describing

"THE AVAMORE 'SQUEEGEE' PUMP."

The subject of the brief paper, said the author, is the invention of Mr. N. G. Beckwith, to whom credit is due for an original idea of great utility and one which cannot fail to be appreciated in our great chemical industries. Most particularly is this the case owing to the essential simplicity of construction, which is so important for dealing with a wide range of chemicals when it is not always possible to provide metals free from corrosion and suitable for sound and practical machine construction.

The outstanding requirements for pumping chemicals, in addition to the usual desired features of good efficiency and high speed, are (1) reliability, (2) rock-bottom simplicity for rapid overhaul, (3) easily replaceable parts, (4) minimum corrosion and leakage, (5) positive action without priming. The general operation of the pump was briefly described.

A rotor, consisting of a disc loosely mounted on an eccentric on the shaft, rolls round the inside of the pump casing. No sliding takes place between the casing and the rotor, but rolling motion is imparted to the rotor, which turns round the eccentric, the latter acting as a bearing. At the top of the casing a metal piece, usually with some spring tension behind, works up and down in a slot, keeping contact at all times with the rim of the disc. Inlet and outlet ports are immediately to right and to left of this metal piece or valve. "Squeeggee" action drives the liquid round in front of the rotor, which, being sealed from the suction side by the valve piece, is driven through the delivery port, while at the same time liquid follows behind the rotor through the suction port. This is the whole action of the pump.

The constructional simplicity and the restriction of the principal wearing surfaces to the bearings, as well as the absence of valves, without sacrificing the positive action or the ability to run without priming, make a pump of extraordinary reliability. The pump in question has been sold for ammoniacal liquor, petrol, tar, creosote, linseed oil, sugar molasses, chlorine water, etc. For strong acids and other highly-corrosive liquids the pump involves an upkeep in money, and, what is usually more important, time, less than any other positive pump known.

Mr. J. A. Reavell said the paper appealed to him, as he had done a certain amount of experimenting on apparatus

very largely on the same principle. The trouble was then a question of lubrication. He would like to hear Mr. Pelmore's remarks on that point for his pump under normal conditions.

Mr. Pelmore said that in the ordinary way the lubrication was ordinary water lubrication. They had had one running six months, and the wear was imperceptible. They had used them for pumping petrol, and, although less lubricating than water, it lubricated itself. It ran at 1,000 revs. per minute, or 1,000 gals. per hour. They had run it at 1,800, and the water film had been quite sufficient. For sea-water, they had successfully used a special metal for preventing galvanising action.

Mr. F. R. Lowe asked what was the clearance between the rotor. Many people had to deal with large quantities of liquid in which they were not certain that small bodies would not be in suspension. His experience was that under such circumstances pumps would not work on the "squeeggee" principle.

Mr. Pelmore said that they had run the pump on sandy water, and the tests were done without rubbers. He thought the rubber would deal with the sediment. It would not matter if there was a negative clearance.

Mr. Lowe: Then you are going to have excessive wear.

Mr. Pelmore replied that if one kept on getting a good deal of matter in suspension it might affect the life of the rubber, and all that would mean was that one could get it retired. If constantly dealing with sandy materials it would be wise to provide spare rotors, and if one showed wear after a year or so it could be sent away to be re-rubbered and the spare put on. The fixing of the spare was a very simple operation. If they brought up the question as to whether with highly corrosive as well as sedimentary liquids it would wear so well, he would be inclined to reserve his answer until experiments had been made with corrosive sediments in liquid.

Mr. F. Cunliffe said he had had experience with rotary pumps, and found that whilst the pump might work well with hot liquids it lost when working with cold liquids.

Mr. Pelmore suggested that in such a case the adjustment should be made to the highest temperature they expected to get. The effect would be a slight diminution in efficiency in running on cold liquor and the maximum on hot.

Captain Goodwin said at the risk of repetition he would like to express the hope that there would be an addendum to the paper on the figures of efficiency.

Mr. Pelmore said that, regarding efficiency, the small pump worked out at 55 per cent., but he believed that efficiency would be increased by a small motor running on high speed. The pressure on the glands affected the power so much that the readings were not within reasonable accuracy to give out the real efficiency. As the pump was increased in size, that factor would become almost negligible.

Mr. R. A. Stewart asked whether the pump was adapted to the pumping of gas. There was a great need for rotary machinery for gas such as SO_2 , and he did not think there was anything yet to fill the bill. If the "squeeggee" pump would pump chlorine or SO_2 there was a great future for it.

Mr. Pelmore said that he hoped the idea would be developed, but obviously for success in that direction lubrication was the key to the situation. Until that problem was scientifically solved he should say the machine was not suitable for gas. He thought the principle so simple and ideal that it would be a great pity if sufficient ingenuity could not be found to solve the problem of lubrication.

Mr. H. Jackson asked what was the greatest head used in the pump.

Mr. Pelmore replied that he thought 183 ft. was the highest they had used, though they did not confine themselves to that. As it went beyond a certain point there was a certain amount of leakage, as in every pump.

Mr. S. J. Tungay read the following paper on

"CENTRIFUGAL PUMPS FOR SULPHURIC AND NITRIC ACIDS."

Of all methods of lifting sulphuric acid, said the author, perhaps none has received greater attention, during the last few years, than the adaptation of centrifugal pumps. This is doubtless accounted for as a result of the difficulties encountered in the case of pumps of other types, mainly through valve troubles. It is a well recognised fact also that a small centrifugal pump will deal with very large quantities of liquid, whereas for handling the same quantity of liquid by

means of a plunger or piston type of pump, a machine of very much larger bulk would be required.

The Haughton Co. have, for some years past, greatly improved the design of regulus metal pumps and Ironac metal pumps for the lifting of acids to considerable heights, and for the feeding of Glover and Gay-Lussac towers in sulphuric acid works. One of the more modern types of double-stage regulus centrifugal acid pumps is designed for lifting sulphuric acid to a maximum height of 100 feet. There is only one gland, and this being on the suction side, there is no fear of leakage of acid at the gland whilst the pump is at work. The pump shaft is fitted with two ring oiling bearings, and is also fitted with ball thrust bearing, so as to take the thrust due to the weight of the head of acid. The incorporation of suitable thrust bearings is a point which many of the earlier designers overlooked when designing pumps for pumping acids to a considerable height, with the result that considerable friction occurred on the pump shaft when working at full speed and heating up of the bearing often resulted. On the pressure side in this pump there is no gland, but simply an enclosed bearing which is maintained full of lubricant from a grease cup. This pump, when lifting sulphuric acid to a head of 75 feet, consumes 1.9h.p., and works at 2,460 revs. per minute.

A centrifugal pump which has been remarkably successful for pumping nitric acid is constructed entirely of "Ironac" acid-resisting iron, with the exception of the bed plate, and possesses some rather unusual points. I believe it to be one of the only pumps, apart from earthenware or pottery pumps, in use for nitric acid and nitro bodies. Arranged with an end suction, the impeller and spindle are in one piece. A long stuffing box and sleeve are adopted, and oil grooves machined in the spindle and kept filled with ceresine wax lubricant prevent any trouble from leakage at the gland. The spindle is supported by two bearings, each of these being ball bearings and totally enclosed, enabling the pump to be run at comparatively high speeds with a minimum of friction or wear and tear. The use of this pump for nitric acid was early recognised by Mr. K. B. Quinan, who had some of them installed for lifting nitric acid at the Government explosives factories.

Some of these small pumps fitted at the Greetland Factory raised 85 per cent. nitric acid to a height of 60 feet continually at temperatures up to 125° F. Five pumps which were fitted pumped 22,000 tons of nitric acid without any expenditure for maintenance. Although the machine itself is of such small dimensions, these are lifting 240 tons of nitric acid per 24 hours in many works. During the war this pump was very widely installed both in this country and in the munition works of our Allies, where it has earned an excellent record for pumping nitric acid and liquors containing nitric acid.

Mr. H. Jackson said he would like to ask how the glands stood.

Mr. Tungay said they had many pumps working nitric acid with a head of 85 feet, and they had no trouble with leakage. With the grooves used the actual pressure reaching the glands was very slight. He found no difficulty with leakage when the pumps were lying idle.

Mr. Jackson said that his experience, though not with that particular pump, was just the reverse. He had always had considerable trouble with the glands.

Mr. Tungay said they had made special provision against that. With the old type of pumps considerable leakage occurred at the glands, but with the modern plant the glands were not subjected to the same pressure. There was no fear of leakage under modern conditions.

Mr. S. A. Wikner raised the question of pumping slurries. He remembered having to pump caustic soda in a process of causticisation. He had put it through a small centrifugal pump in which the space between the propeller blades was small and the particles choked it up. It was partially overcome by putting in a straining box. He did not see why the propellers should not always be wide.

Mr. Tungay thought there was no reason why they should not be quite wide and efficiency be attained. He had used the centrifugal pump for copper sulphate and other liquors with crystals and had no difficulty at all.

Mr. A. Rudge asked whether iron was suitable for the centrifugal pump.

Mr. Tungay replied that if he was referring to cast iron, it was a very ambiguous quantity nowadays.

Mr. Reavell remarked that just before the war Mr. Kestner had patented and developed a direct-action pump with a definite clearance, and it was a perfect success. The leakage was one or two drops per hour. He knew the metal was all right, as Mr. Tungay had made it. The pump was so successful that the Germans when occupying Lille took two truckloads of them to Germany, the whole of the patterns, and all the detailed drawings.

After an informal dinner at the Central Station Hotel the evening session was commenced under the presidency of Prof. P. P. Bedson, of Armstrong College.

A paper was read by Mr. R. A. Stewart describing

"THE 'MARCLEN' PUMP."

In view of the convenience, compactness, and small number of working parts of the centrifugal or rotary pump, it is not to be wondered at that it has been for some time past adapted for the purpose of elevating acids. Most of the well-known makes, however, have one common defect—namely, a gland. It was after a wearisome and costly experience with various makes of pumps in regulus and so-called acid-resisting bronze, and stoppages caused by the destruction of the packing and consequent leakage from stuffing boxes, that the "Marclen" pump was devised.

This pump possesses certain features in common with other centrifugal pumps, but differs from them in being glandless. Essentially, it consists of a casing and a rotor or impeller with a vertical spindle. This method of construction has been adopted in order that glands may be dispensed with, and this is a great desideratum. Delay, expense, and other inconveniences in connection with the packing of glands are avoided. Moreover, friction is obviated, and this in itself is a great advantage, especially in the case of pumps made in regulus or stone-ware.

The casing, in one of the more simple forms of the "Marclen" pump, is suspended by means of bolts from a strong cast-iron frame resting upon girders lying across the acid tank in which the pump is placed, the bolts being covered with lead to prevent contact with the acid. The vertical spindle, which is also lead-covered up to the underside of the bottom bearing, extends upwards and revolves in bearings fitted in a strongly made cast-iron frame resting upon cross girders lying upon the acid tank in which the pump body is placed. The two bearings maintain perfect rigidity in the spindle, and prevent any tendency to "whip," whilst the thrust ball bearing at the top, and the collar under the upper bearing, make any vertical movement impossible. When the pump is working the acid is drawn in at the vortex, which is formed both at the top and the bottom, and is expelled from the annular duct in the casing upwards into a delivery pipe. The outlet from the casing may be, and is sometimes, tangential.

There is no limit to the size of the tank in which the pump is immersed, but in practice it is convenient to

place the pump in a small tank connected with a larger storage tank, in which case, should the latter be deeper, or on a higher level than the pump tank, the supply of acid to the pump is regulated by means of an ordinary valve, or a valve controlled by a float.

These pumps have been working for over two years with various corrosive liquids, including concentrated and dilute sulphuric and phosphoric acids and hydrochloric acid; also very strongly alkaline liquors, at the boiling temperature, containing a heavy sediment mixed with ashes. The following are some of the uses for which the "Marclen" pump is well adapted: The elevation of hot saline solutions to crystallising vessels; the removal of salts deposited from solutions undergoing evaporation; the emptying of caustic soda or sulphide of sodium finishing pots; and mixing liquids and solids in dissolving tanks. Employed for the last purpose, either outside or immersed in the dissolver itself, the "Marclen" pump imparts a vigorous agitation to the contents of a relatively very large vessel.

Prof. Bedson then vacated the chair owing to having to attend another engagement, and Mr. George Sisson took his place.

Mr. Tungay opened the discussion on Mr. Stewart's paper, and said he wondered whether Mr. Stewart had experienced any difficulty owing to the large diameter of the valve seat which had to be secured at the top end of the float. He had described a certain amount of revolving motion by the float, and it appeared to be one of the weak points. He also thought that Dr. Lunge had described a similar sort of pump suspended vertically in a tank of acid.

Mr. Stewart said that the pump had not yet been made with the particular valve in question, but it was working quite successfully in its original form. He had not seen anything like the Marclen pump, but after Mr. Tungay's remarks he would certainly look it up. When the pump was first made there was certainly no difficulty in getting a patent.

Mr. Reavell said it seemed to him that, with the exception of the float, the pump was practically the same type as one already constructed. During the war Mr. Kestner had built a large number of pumps of that type, the difference being in the float. It might be that he did not quite understand it, but he was rather at a loss to know what the float was for.

Mr. Stewart said the thrust-bearing and collar under the bearing was simply to prevent the vertical movement. The float was to deal with a big head of acid, which might be so great as to give the pump too much to do. He was not aware, excepting from what he had heard that night, that there was any pump on the same lines in use in the chemical industry.

Mr. H. M. Ridge remarked that he had used something like the same sort of thing before the war for the circulation of weak acids which had certain particular difficulties about them.

Captain Goodwin thought that in the discussion they were not quite doing justice to the design of the Marclen pump. The mere fact that it was on the market as a commercial proposition was something. Certain pumps of a similar character had been used in South Africa and America, but they were not exactly the same design. He thought the fact that the patent had been granted was sufficient to get on with the job of making them. Regarding the question of mixing, it might be of interest to mention that he had made use of a centrifugal pump for neutralising the contents of a large vat by drawing the liquid from the bottom of the tank and distributing by a feed pipe. He reduced the time for neutralising the contents of the vat by one-quarter of the time taken by the ordinary stirring gear.

Mr. H. Jackson said the pump appealed to him as it had no glands. He had a great deal of trouble in pumping sulphuric acid, as the glands were always leaking. He confessed it would be a long time before he would be persuaded to use a centrifugal pump with glands.

Mr. Stewart said he would never be persuaded to use a pump with glands again. One or two of the pumps they had had were much simpler than anything he had described

there. If he could take them to his works they would be struck by the efficiency. When a supply of acid was wanted the belt was put on and that was an end of it.

The chairman remarked that he had derived great pleasure from the discussion which had followed the reading of the paper.

A paper was read by Mr. J. H. West, A.C.G.I., A.M.Inst.C.E., on

"GENERAL TYPES OF PUMPING MACHINERY USED IN CHEMICAL WORKS."

Mr. West explained that his contribution to the Conference was only to describe and illustrate by lantern slides some of the apparatus for moving liquids in chemical works. He hoped at a later date to enlarge upon the subject and provide a complete paper.

Mr. West then proceeded to describe the following apparatus: The Evans' patent "Cornish" direct-acting horizontal steam pump; the Evans' duplex horizontal bucket type pump; Evans' "Reliable" fly-wheel horizontal steam pump; the "Reliable" piston valve horizontal steam pump; the "Premier" horizontal air compressor, with fly-wheel motion; a handy form of vertical fly-wheel single-ram steam pump; a horizontal three-throw pump; a motor-driven horizontal treble-ram pump; a large quadruple-acting horizontal ram pump; a motor-driven acid pump constructed entirely of lead-antimony alloy; the Ferraris acid pump, of Italian origin and of the vertical plunger diaphragm type; the "Premier" diaphragm pump; and the Ogden automatic acid elevator.

Captain Goodwin said he hoped that the Humphrey pump would be studied as it deserved to be, and that it might be developed in one form or another. Another method was the use of the vacuum for moving liquids. On the face of it, it might seem rather irrational to use the vacuum, as it was more efficient to compress air. In certain cases, however, it gave advantages due to the absence of floats. In its simplest form, it would consist of a receiver and suction-pipe dipped into the tank, with a suitable non-return valve on the suction-pipe. The possible head was limited to 30ft. in the case of water or heavy liquid. The use of vacuum had considerable advantages in the moving of liquid from one vessel to another in the course of continuous processes. In connection with the distribution of liquids in chemical works, he would like to urge the necessity of paying more attention to the standardisation of pipe lines between corks and valves to facilitate replacements and reduce the number of spare parts to be kept in stock. Again, the pipe-lines ought to be painted in distinctive colours; in some Government plants that had been done. The great need was for a standard colour to be used in all works, otherwise men changing from one works to another might be liable to cause accidents. The capacity of storage vessels ought to be standardised, and the flange connections to the various pumps, so that when a pump gave out it would be an easy matter to replace it by a pump of another make about the works.

Mr. W. Hayhurst then read a paper on

"PUMPING ACIDS AND OTHER CORROSIVE LIQUIDS. WITH PARTICULAR REFERENCE TO THE ARMOURED CERATHERM CENTRIFUGAL PUMP."

Providing that it can be obtained in suitable forms, ceramic material offers the largest possibilities for the construction of pumps for the chemical trade. Ceramic material can be obtained which is quite insoluble in almost any corrosive liquid. The hard nature of the product also reduces wear due to erosion to the minimum.

The type of ceramic material chosen by the writer for his pump was a form of "Ceratherm." Ceratherm is a new acid-ware, which was prepared during the war for rapid condensation of large quantities of acid gas in the manufacture of explosives. It has useful properties

which make it suitable for this work in that small articles can be heated to a red heat and plunged into cold water without cracking and it conducts heat much more quickly than ordinary stoneware, thus enabling an equable temperature to be maintained throughout any apparatus in to which it is made. The type of Ceratherm used for the manufacture of pumps, however, was not the same as that used for the manufacture of Hart's nitric acid condensing plant, for instance, but a type was prepared with considerably increased tensile strength.

The pump shown is identical in many respects with the German type imported into this country shortly before the war with the exception of the fact that it is made of Ceratherm, and therefore is more suitable for hot liquids or variable temperatures—a condition which was likely to crack the German pump,—and the method of putting the impeller on to the shaft is quite different from the German.

I now refer to the Guthrie Ceratherm pump. The examples shown illustrate the method now in use in the manufacture of these pumps. Attention should be directed to the following points:—

1. The casings are made exceedingly thick and strong. They are set into the iron armourings by means of one of the cements manufactured by the same firm, which possesses remarkable acid-resisting properties.

2. The inlet and outlet of the pump are so constructed that coupling up can be accomplished without any fear of damaging the pump.

3. The acid or corrosive liquid is fed into the pump on the gland side. No trouble whatever is experienced in packing this gland, which is continually under suction, and a small quantity of wool soaked or not soaked, as may be desired, in paraffin wax and pressed home with the fingers provides all that is necessary. Heads of 200 or 300 feet can be attained without the slightest leak or trouble at the gland. These casings are found most efficient in use and will withstand many times the pressure to which they are normally required to be subjected.

The fixing of the impellers on to the steel shaft is a matter which requires very careful consideration, and after some experimenting the method adopted was to prepare a cementing material of very high acid resistance to fill the interior of the shaft of the impeller. This material receives a screw thread, and the shaft is then screwed into the impeller, which is ground and balanced on its own shaft. From being one of the weakest features of the old German type of pump, this method of connecting the ceramic portion to the steel shaft has now become one of the strongest and most satisfactory features of the pump. The Manx impeller, which is, so far as we are aware, entirely new in idea, is almost self-balancing so far as thrust is concerned and gives very little thrust along the shaft. The tendency at present is that in the Guthrie Ceratherm pump the Manx type of impeller is almost always supplied and special thrust bearings are not necessary.

In the neighbourhood of 40 feet head efficiencies of 60 per cent. have been attained. In the neighbourhood of 120 feet head efficiencies of the order of 40 per cent. have been obtained even with the diminished quantities required by the acid trade. If large quantities are required very high efficiencies could probably be attained at high heads, say in the neighbourhood of 70 per cent.

The experience referred to in this paper has been obtained on a practical scale in actual work, and the following liquids have been pumped with success: Sodium

peroxide, hot and cold solution; hydrochloric acid, both hot and cold; nitric acid of various strengths and different temperatures and containing various impurities; and solutions of metallic salts of acetic acid.

Mr. Ridge said the author had made some references to the heating of a vessel with a metal outside and lined with ceratherm. He would like some information as to whether the expansion of the ceratherm was identical with the cast iron or mild steel, whatever was used. Another point he would like to hear more about was the conductivity.

Mr. Hayhurst said that tensile strength figures were not easy to give, but, in his opinion, the proper way to get an idea of what ceratherm would stand was to run it until it burst, and they would get the tensile strength.

Mr. Reavell said there was the point that if that was done the thing would get out of balance sooner or later, and the thing might go off on account of vibration.

Mr. Hayhurst said he thought they were asking what would happen in practice, and in practice it would go out of balance. He had not succeeded in bursting one yet. He had given a figure of 3,000 revs. for the larger impellers, and that gave a safety factor at once of four or more. He did not think there was any other really reliable way of getting a figure. After all, the question was: How do they work, and how do they stand up in use? He could say that they had run impellers faster than they ought to, and they did not break. With regard to the heat transmission, he had not had space in the paper to go wholly into that question. The transmission of heat was based on figures from actual practice, using a lead coil. It was in use, and transmitting heat quite satisfactorily. He had not yet had an opportunity of taking accurate readings. So far as the question of linings being affected by different coefficients was concerned, the linings were fluted on, and they had never had one come off in use.

The Chairman said that they were all very grateful to the authors for the great deal of information they had received from the papers themselves and from the discussions which had followed. The problems were difficult ones, but he believed they were on the way to being solved. He asked them to join in a hearty vote of thanks to the speakers.

The Secretary (Mr. Talbot), in moving a vote of thanks to the Chairman, referred to the wire from Professor Hinchley, and added that they would all regret to hear that he was suffering from the effects of overwork and had been ordered to take a long holiday.

It was decided to send a telegram to Professor Hinchley sympathising with him in his illness and wishing him a speedy recovery.

Captain Goodwin moved a vote of thanks to Mr. Talbot for his work in making the Conference a success.

The Secretary, replying, said that anything he had done had been more than rewarded by the success of the Conference.

OUR BOOKSHELF.

PRACTICAL DRY CLEANER. 5th edition. Edited by J. B. Gray. London: Hodder and Stoughton; 15s. net.

In the 5th edition of this very successful work, all obsolete matter has been deleted. Rapid strides have been made in processes and plant employed in this growing industry, and as it is one which consumes considerable quantities of chemical products we have no hesitation in introducing it to the notice of our readers.

PRACTICAL LEATHER CHEMISTRY. By Arthur Harvey. London: Crosby Lockwood and Son; 15s. net.

A laboratory manual for the student in chemistry specialising in the leather industry, incorporating a very large number of new methods from various sources which hitherto have not reached existing text-books. A list of references is contained which will enable the student to go further into individual items.

INSTITUTE OF CHEMISTRY.

PROCEEDINGS OF THE COUNCIL.

THE following extracts are made from the Proceedings of the Institute of Chemistry for June-November, 1919 (Part IV.), just issued.

PATENTS AND DESIGNS BILL.

The Council have expressed their concurrence with the Report of the Patent Laws Committee of the Conjoint Board of Scientific Societies in advocating the following improvements in the British Patent Law:—

(1) The extension of the present period of provisional protection.

(2) The extension of the period of protection from 14 years to 17 years as in the United States.

(3) A reduction in the scale of fees. The present fee for the first four years should remain, and all renewal fees should be substantially reduced.

(4) The adoption of the "File Wrapper" system as employed in the United States.

The recommendations have been forwarded to the Board of Trade.

The Patent Laws Committee of the Conjoint Board consisted of Sir Robert Hadfield, Sir Dugald Clerk, Mr. Horatio Ballantyne (who has represented the Institute in the Conferences of Scientific and Technical Institutions concerned with this matter), and Dr. W. W. Watts (secretary of the Conjoint Board).

GLASS RESEARCH.

By arrangement with the Department of Scientific and Industrial Research, the researches proposed to be undertaken by the Vitreous Compounds Committee will be transferred to the British Scientific Instruments Research Association, of which Sir Herbert Jackson is the director. The Department has expressed its appreciation of the initiatory work of the Institute in this matter.

CHEMICAL GLASSWARE, FINE CHEMICALS, AND SPECIAL REAGENTS.

The Council have received a letter from the Department of Scientific and Industrial Research asking for an expression of their views with regard to present supplies and quality of British-made chemical glassware and of fine chemicals for research purposes. The Glass Research Committee of the Institute is inquiring into the first matter and invites the views of Fellows and Associates thereon. The Council understand that the question with regard to fine chemicals is under the consideration of the Federal Council for Pure and Applied Chemistry.

The Joint Committee of the Institute of Chemistry and the Society of Public Analysts, under whose direction a List of Reagents for Analytical Purposes was published in 1915, have under consideration the desirability of revising and extending the List referred to, provided a sufficient number of manufacturers are prepared to produce "A. R." chemicals according to the standards specified. It is probable that the Committee will proceed with the revision of the List, and they will be glad to receive suggestions from the Fellows and Associates in that matter.

MOND NICKEL COMPANY, LTD.—Interim dividend of 7 per cent. per annum on the cumulative and non-cumulative preference shares for the half-year to October 31, 1919, less income-tax, and 1s. per share on the ordinary shares on account of the year to April 30, 1920, free of income-tax.

MICRO-STRUCTURE OF CEMENT AND CONCRETE.

IN the course of his presidential address to the Concrete Institute, Mr. H. D. Searles-Wood stated that the Science Committee was considering the question of the investigation of cement by means of micro-sections, and in due course a report of this would be forwarded to the Research Department. It was generally known, he added, that a good cement, under favourable conditions, tended to increase in strength with age, and that the action of setting in such increase in strength was due to hydration. There appeared, however, to be but few data available as to the actual change in form of the various components of concrete from a microscopic standpoint, although it was understood that American and German scientists had already carried out some investigations. That chemical changes took place in the progress of setting was proved by chemical analysis, but the analyses remained to be properly co-ordinated with the micro-structure of the cement or compo during the process of hydration.

Mr. Searles-Wood also said that watertightness was one of the most important requirements of cement and concrete, more particularly in connection with reinforced concrete, and in connection also with their use either in the form of mass concrete or as reinforced concrete for tanks or vessels for containing or excluding liquids. Percolation tests on ordinary concrete had shown beyond question the fact that even with clean, filtered water all concrete tended in time to become less porous, provided the pieces under test were kept moist, thus proving that the chemical changes produced alterations in the micro-structure tending gradually to fill the small voids with crystalline growths. How these crystalline growths developed was a matter which it was desirable should be carefully investigated, and the only satisfactory method which presented itself at the present time was by examination of the micro-structure of cement and cement compo during development.

STORAGE OF COAL

A NOVEL method of storing coal in carbonic acid gas, which combines the advantages of the overhead bunker with the absolute safety of storage under water against spontaneous ignition, has been adopted in an installation described in the *Iron and Coal Trades Review* as having been recently erected at Dortmund, in Germany. It consists of three cylindrical bunkers—with semi-spherical tops and bottoms,—each bunker holding 2,500 tons of coal. There are three outlets in each bunker for withdrawing the coal and three holes at the top for receiving it; the lower outlets close gas-tight, whilst those on the top, though requiring a good fit, need not necessarily be gas-tight, since carbonic acid gas is nearly twice the weight of air, and does not, therefore, escape at the top. A simple structural steel tower unloads the coal by grab from a barge; the coal is then shot into a small hopper from which it is fed on to a push-plate conveyor, the path of which completely envelops the three bunkers in the vertical plane. It can, therefore, both feed and reclaim the coal. There is a slight leakage of carbonic acid gas during the withdrawal of the coal, but this is stated to be small, and can be easily replenished.

ADVICE TO THE OIL AND COLOUR CHEMIST.

At a meeting of the Oil and Colour Chemists' Association on December 11, Mr. A. M. Gibbon read a paper, entitled "The Principles of Application of Paints and Varnishes and How It Affects the Works Chemist." The author pointed out the importance of the paint and varnish works chemist studying the practical conditions under which paints and varnishes are applied. It was a common thing, for instance, for the bolts and rivets in structural painting to be very badly painted, and as this formed points at which corrosion could commence the manufacturer was often held to blame for supplying a paint which did not afford sufficient protection against corrosion. It was, therefore, to the advantage of the chemist and the products of which he was in charge to follow up what happened to them after they left the works.

A good enamel or paint put on by a poor workman often gave worse results than a poor enamel put on by a good workman. A point often overlooked was that it was the pressure of application which determined the degree of durability. Printing ink on posters, for instance, did not peel off because it was put on with considerable pressure, and the chief reason why the paint on a painting did not peel was that the artist applied it with an upward push of the brush which gave a fair amount of pressure and at the same time pushed the air out. Oil and colour chemists must study the conditions of the trade with which they were concerned, and not be carried away with the results of scientific experiment only. It was essential to meet the demands of the user; when that was done, improvement would go forward by leaps and bounds. What was really necessary was that the paint and varnish industry should be sub-divided in such a manner that there would be specialist chemists for particular branches. Something was done in this connection already, but not sufficient.

In connection with the application of paint, nothing had been found to supersede the brush in the hands of a good workman, but it was being displaced for reasons of speed and economy. At the same time, a mechanically applied paint was seldom so durable as the hand-applied. Spraying, however, was the method of the future, although it was by no means perfect at present. He did not mean that the apparatus did not fulfil its functions, but that the life of the paint so applied was not good. One reason was that compressed air was the force employed, and to spray a thin film of paint it was necessary to dilute the paint with air. In other words, a form of atomiser was used which broke up the paint into small globules. The result was a very fine spray with an excess of oxygen, which tended to destroy the paint, and although some inert gas, such as nitrogen, might be used, this would increase the cost. Nevertheless, he could not conceive that the present spraying apparatus was a perfect way of applying paint, as it involved a cloud of paint in the atmosphere and the necessity for the operator to wear a mask.

The Chairman (Mr. H. Morgan), whilst agreeing with the author that it was necessary for scientific workers to come to earth sometimes and see the actual problems they were up against, thought the best method to pursue was to make the best paint in the first instance, and then teach the users how to apply it.

Mr. E. Brand referred to a specification for iron which had to go to South America, one of the conditions of

which was that the metal was to be heated and dipped in linseed oil. The theory was that the linseed oil dried on the surface and prevented the iron from rusting. With regard to the present high cost of materials and labour, he urged that it was not economy to attempt to use cheap materials, as these involved more frequent painting, and the cost of labour to do this more than counter-balanced the saving in materials in the first place.

Mr. A. Molteni thought the practical conditions under which paints were used varied so much that it was practically impossible for the chemist to carry out research on the line suggested by the author. The conditions of rusting, for instance, were so many and so complex that it would be practically useless to produce a great number of paints with the idea of providing for all conditions. Therefore it was necessary to produce the best paint possible; there should then be no difficulty in finding the right conditions of application.

Mr. J. Lawrence, speaking with regard to spraying, said he had had spraying paints under observation for many years and had found their durability very good. The idea that air was blown into the paint, and thus enabled oxygen to reach the surface of the metal, was slightly overdone. Driers were an important consideration in regard to decorators' paints. The success of any paints was due to the fact that they were applied in thin coats, which dried very quickly, but where the coats were thick and a second was put on before the first had dried trouble arose from the effects of oxygen. The difficulty with regard to bolts and rivets was sometimes got over by making the specification so that the rivet and bolt heads had to be touched up before the painting was done. In that way the painter's attention was drawn to the rivets, and perhaps the work was then done a little more thoroughly than it otherwise would be.

Mr. R. P. L. Britten thought there was a large field before chemists to discover a paint which did not require pressure in its application. His experience of spraying was that, if proper paint was sprayed on, it lasted very well. His experience of air-dried and stove-dried enamel was that the former was brittle and the latter very flexible.

Mr. H. A. Carwood referred to a case in which a ship's bottom had to receive two coats of anti-fouling composition within 24 hours. The result was failure, for the ship came back after two or three months with all the composition gone. The manufacturers were blamed and did not get any further orders, but the trouble was due to the manner in which the composition was applied.

Mr. Makins said that in the future there would be a greater concentration upon mechanical means of applying paints, and unless paint manufacturers saw that their paints were of the right consistency for these methods of application they would be left. His experience was that spraying apparatus should use the smallest amount of air and the least amount of pressure.

Mr. Britten remarked that very little was known at the present time as to what happened when paint was sprayed. It was more than likely that paint sprayed at high pressure would be more durable than paint sprayed at low pressure.

The Author did not reply at length, but promised to do so in writing.

UNITED INDIGO AND CHEMICAL COMPANY, LTD.—Interim dividend at rate of 5 per cent. per annum for six months ending December 31.

THE ACTION OF WATER ON LEAD.

AN interesting paper on "The Action of Water on Lead," by Messrs. J. F. Liverseege, F.I.C., and Mr. A. W. Knapp, B.Sc., F.I.C., was read at a meeting of the Birmingham and Midland Section of the Society of Chemical Industry, held at the University of Birmingham, on Thursday (December 11). Mr. L. P. Wilson, the chairman, presided. The latter gave a cordial welcome to the Section to Professor Morgan, the successor to Dr. Percy Frankland in the Chemical Department at the University.

The paper was read by Mr. Knapp. It is well known, the authors pointed out, that many waters act on lead. The action was made the subject of extended experiments by Dr. Houston, who invented the erosion test. The waters which Dr. Houston examined were acid in character and notable for their power of dissolving lead. On the other hand, their experiments dealt with a faintly alkaline natural water, which, like distilled water or pure rain-water, dissolved very little lead, but which had in the untreated condition the power of eroding the lead, so that scales formed on it fell away, leaving a fresh, bright surface open to attack. The erosive ability was not considered by Dr. Houston to be a dangerous quality, save under special conditions and in the presence of bright lead.

The water used in the tests was from the Birmingham watershed at Rhyader, in Wales. In order to avoid any risk of so soft a water acting on lead, a small proportion of chalk is added to the water at the beginning of the aqueduct; the usual addition in recent years has been about two parts per 100,000. The Welsh water (Rhyader) has a slight alkalinity, due to bicarbonates, etc., equal to about 0.3 parts CaCO_3 per 100,000. The action on lead is mainly erosive. The erosion test is an estimation of the action of the water on completely immersed sheet lead. The value of the test lies in the fact that a high erosion figure is an advance warning that the water in its fluctuations may be approaching a dangerous condition. The erosion test is performed with bright lead in water with free access to air, and under these conditions a water will erode lead when it is unable to act on lead service pipes to any extent. The kind and position of the erosion will depend on a number of conditions, the chief of which is alkalinity. Three kinds of action occur—with waters of alkalinity 0.2 to 0.6 (*i.e.*, untreated Welsh waters) and generally with treated waters, whose alkalinity does not exceed 1.5, the whole of the surface of the lead is eroded. A flocculent precipitate forms, which falls to the bottom of the tube and leaves the lead surface quite bright, but mottled. With treated waters of alkalinity 1.5 to 2.5, the action is usually corrosion rather than erosion; a loosely held opaque white crust forms here and there irregularly on the lead surface. With waters of alkalinity 2.5 and over, the lead almost invariably becomes covered with a dull whitish film, which appears to act as a protective coating.

"Erosion" is due to the action of oxygen in the presence of water; such variations as occurred naturally in the percentage of oxygen present in the water produced no appreciable effect on the erosion. One day is the most suitable period for the erosion test. Exposure to glass lowers the water's erosive ability. In some experiments on the influence of contact with the glass of test tubes, ordinary tubes were compared with those which had been coated internally with a thin layer of paraffin wax. The mean alkalinity of the water was 2.3. The

results showed that the paraffin-coated tubes gave no better duplicates than ordinary tubes, and that the erosion figures in paraffin-coated tubes were higher (mean of 13 tests: paraffin-coated, 4.7; ordinary, 3.8). The greater the depth at which the lead is immersed in the water, the slower the erosive action. The velocity of erosion falls as time proceeds; variation in the volume of water does not appreciably affect erosion. For the untreated water the amount of lead eroded varies directly with the area of lead exposed. Small changes in the area of the water surface produce no appreciable effect on the erosion. Erosion readily occurs in waters which contain no carbon dioxide. Such variations as occurred naturally in the percentage of carbon dioxide present in the water produced no appreciable effect on the erosion. The presence of from 1 to 2 per cent. of carbon dioxide causes a sudden change from "erosion" to "plumbo-solvency." Carbon dioxide dissolves lead more rapidly in the presence of oxygen.

The question may be asked if the presence of carbon dioxide is necessary for erosion to occur. All the evidence the authors have goes to show that it is not necessary. Erosion takes place readily in the absence of free carbon dioxide—for example, when 1 to 200 parts of calcium hydrate per 100,000 are present,—and further, erosion takes place less rapidly in the presence of bicarbonate and carbon dioxide than with carbonate and hydrate alone. Under normal conditions for ordinary waters, carbon dioxide is an unimportant factor. Given oxygen, the alkalinity of the water is the principal factor determining the amount of "erosion." Not only the amount but the kind of erosion depends chiefly on the alkalinity of the water.

The addition of small quantities of calcium hydrate, carbonate, and bicarbonate, or of potassium permanganate, decreases erosion. Experiments show that as the amount of calcium hydrate present in the water increases, the amount of lead eroded falls to a minimum when there is present about 7 to 10 parts of calcium hydrate per 100,000. After this point, increase in the calcium hydrate causes increase in the erosion, which gradually attains about its original amount. As the amount of calcium carbonate and bicarbonate present in the water increases, the amount of lead eroded continually falls. Calcium carbonate is, by far, the most effective preventer of erosion. Only about half the quantity of bicarbonate is required to form a protective coating as compared with carbonate. This would receive a theoretical explanation if, as seems probable, the coating is a carbonate of lead. As little as 2 parts per 100,000 of calcium carbonate is generally sufficient to form a plumbo-protective coating on the lead. Erosion occurs in the absence of bacteria. The bacteria in the water are not all destroyed by exposure to lead for six hours.

DISCUSSION.

The chairman in the course of the discussion suggested that, as the tests had been made with ordinary commercial lead, comparative experiments should be made with chemically pure lead, as the latter almost entirely resisted dilute or strong sulphuric acid.

Dr. Maxted inquired as to the influence of agitation on the rate of the solution of lead. He imagined that agitation might loosen any protective deposit that might be formed.

Mr. Knapp, in reply, said commercial lead was used because it was felt they were dealing with a practical problem. Commercial lead was extremely pure, but he was willing to test with chemically pure lead. Neither the question of varying temperature nor that of agitation had been dealt with. They had tried the effect of adding small quantities of potassium permanganate and found it reduced erosive ability to a low figure.

PROSPECTS OF BRITISH CHEMICAL TRADE IN INDIA.*

CHEMICALS AND CHEMICAL PREPARATIONS.

THE imports of chemicals, excluding chemical manures and medicines, into India during the war, have been as follows:—

Principal Countries of Consignment.	1913-14.	1914-15.	1915-16.	1916-17.	1917-18.
	£	£	£	£	£
United Kingdom	505,271	556,851	799,260	868,827	1,219,976
Germany	84,072	37,276	6,555	182	—
Italy	35,112	35,721	44,576	70,121	5,775
Japan	10,110	15,166	63,210	215,772	371,078
United States	1,862	10,641	28,098	56,589	195,595
Total imports	676,506	683,361	972,426	1,251,322	1,815,004

The United Kingdom has been able to hold its own fairly well, and Japan and the United States have, broadly speaking, taken the place of all other suppliers to the market. It will probably be of interest if we deal with the principal classes of chemicals in greater detail.

Acids.—The total imports of acids have declined from 78,435cwt. in 1913-14 to 6,876cwt. in 1917-18. This decrease has been most marked in the case of sulphuric acid, the imports of which have been reduced from 3,197 tons to 21 tons. This decline is largely due to the increased manufacture in the country from sulphur imported from Sicily and Japan. A plant for the manufacture of sulphuric acid is being erected by the Burma Mines Co. at Jamshedpur (Sakchi), in connection with their scheme for the production of spelter from the Burma zinc concentrates. These concentrates consist largely of zinc sulphide, and when roasted produce sulphur dioxide, which can be used for the production of sulphuric acid in the ordinary lead chamber. As the sulphur dioxide is a by-product, the cost of producing the acid by this means should approximate that of imported acid, and consequently it is probable that before long India will produce the whole of her requirements of sulphuric acid. The imports of nitric acid have fallen from 4,868cwt. to 797cwt., and it is believed that the plant available for its manufacture in India is sufficient to meet all reasonable demands in the future, unless, of course, the manufacture of dyes or explosives is commenced in the country. The imports of hydrochloric acid are very small, and the output in India is approximately 600 tons per annum.

Bleaching Materials.—The imports of bleaching materials have increased from 75,628cwt. to 100,236cwt., and the principal supplier is now Japan, whose imports have risen from 1cwt. in 1913-14 to 61,840cwt. in 1917-18. The shipments from the United Kingdom have declined from 58,062cwt. to 33,418cwt.

Soda Compounds.—The total imports have increased from 662,962cwt. to 1,012,649cwt., and it is gratifying to note that the United Kingdom has well maintained her position in the trade, largely due to the energy of one of the largest British companies who, by dint of an active selling organisation in the country, are holding their own. The Magadi Soda Company of East Africa are shipping increasing quantities of crude soda, which are being worked up in Calcutta, and which compete with the United Kingdom supplies, while Japan has increased her shipments from 101cwt. to 13,168cwt. The principal articles of import are caustic soda, soda ash and soda crystals, which are largely used by soap and glass works, dye houses, etc. The imports of bicarbonate of

soda are also considerable. So far, India does not produce these articles, but will probably be able to build up an industry, using the crude soda from Lake Magadi as a raw material.

Sulphur.—The imports of sulphur have increased from 126,541cwt. to 195,692cwt., largely on account of the demand for the manufacture of sulphuric acid. Japan supplies 95 per cent. of India's requirements.

Carbide of Calcium.—About 1,000 tons a year were imported before the war, mainly from Germany, Norway, and the United Kingdom. The imports have now fallen to about 640 tons, of which 540 tons are drawn from Japan, and only 37 tons from the United Kingdom.

Potassium Compounds.—The imports have been reduced from 728 tons to 384 tons, but the values have increased from £39,000. to £93,000. The British imports have fallen to one-third of their pre-war size, while Japan has increased her shipments from nil to 112 tons, and the United States from nil to 97 tons.

Disinfectants.—In 1913-14 the imports were 1,270 tons, valued at £26,394. In 1917-18 they had increased to 1,570 tons, valued at £67,415. The United Kingdom has fairly well maintained her position, and in the latter year supplied 88 per cent. Here again Japan has increased her shipments from less than one ton to 150 tons, valued at £13,403., and now furnishes 10 per cent. of the supplies. The various British brands are the most popular on the market, and if only steps are taken to keep them well before consumers we shall retain the trade.

DRUGS AND MEDICINES (EXCLUDING CHEMICALS AND NARCOTICS).

The value of the total imports has increased from £780,490. to £889,210., but the shipments from the United Kingdom have receded from £401,000. to £354,000. Our principal competitors are Japan, the imports from which country have increased from £109,000. to £266,000., and the United States, the value of whose goods advanced from £31,000. to £64,000. The Japanese imports almost entirely consist of camphor, also a small but increasing trade in patent medicines. Japan has already obtained a firm hold on the China market in such harmless specifics as "Jintan" and "Ching Kuai Wa," and there are signs that she is making a bid for the large Indian market for proprietary and patent medicines. The American imports mainly consist of patent medicines, quinine salts, and miscellaneous drugs. The British trade is principally in patent medicines, of which the United Kingdom provides nearly two-thirds, quinine salts, and the whole range of chemists' requirements. The keenest competition so far as high-grade drugs are concerned will probably be from the United States, as American travellers are very active, and great attention is paid to the making-up and packing required by the market. Japanese patent medicines will probably compete more and more with British, but, on the whole, they are of a lower standard, and their low price is the main attraction.

DYEING AND TANNING SUBSTANCES.

The total imports, which in 1913-14 were valued at £943,000., fell to one-third of that figure in 1915-16 on account of the elimination of German dyestuffs from the market, but rose to £941,000. in 1917-18, and to £1,060,000. in 1918-19 now that more regular supplies of aniline dyes are being obtained from England and America.

Alizarine Dyes.—The decrease in the imports has been enormous. In 1913-14, 6,469,739lb. were imported, of

* Report on "The Conditions and Prospects of British Trade in India at the Close of the War," by H.M. Senior Trade Commissioner in India and Ceylon (Mr. Thomas Ainscough, O.B.E.).

which Germany supplied 4,637,450lb., the United Kingdom 963,698lb., and Belgium (mostly of German origin) 804,243lb. In 1917-18 only 157,862lb. were imported, of which the United Kingdom sent 154,673lb. and Japan 2,688lb. In the year 1918-19, however, there has been a great increase to 1,604,577lb., largely due to the increased exports from the United Kingdom and United States since the Armistice.

Aniline Dyes.—The imports in 1913-14 amounted to no less than 9,703,122lb., valued at £511,822. The figures declined to 552,732lb., valued at £95,274., in 1915-16, and then advanced to 1,970,304lb. and £574,038. in 1917-18, and 2,170,238lb. and £637,000. in 1918-19. In 1917-18 the United Kingdom supplied 1,425,527lb., valued at £288,000., the United States 385,114lb., valued at £247,077., and Japan 101,418lb., or £16,757.

Synthetic Indigo.—India has never been a very large market for artificial indigo, although the synthetic product was rapidly ousting the natural vegetable indigo from the market. In 1913-14 6,051cwt. were imported, of which Germany, including shipments via Belgium, supplied 5,986cwt., and the United Kingdom 20cwt. (probably of German origin). In 1917-18 the quantities imported had fallen to 39cwt. (69cwt. in 1918-19) and the values to £440. (£840. in 1918-19). Practically the whole of the synthetic indigo is now drawn from the United Kingdom, the small amount obtained from China in 1916-17 representing old German stock.

The remarkable strides made in British import dyes during the last three years are clearly shown in the following table:—

TOTAL IMPORTS OF DYES OBTAINED FROM COAL TAR (ALMOST ENTIRELY ALIZARINES AND ANILINES).

Countries of Consignment.	Quantities.			Value.		
	1916-17.	1917-18.	1918-19.	1916-17.	1917-18.	1918-19.
	Lbs.	Lbs.	Lbs.	£	£	£
United Kingdom .	610,436	1,580,200	2,697,907	150,241	363,273	362,015
Switzerland	41,713	49,035	152,753	12,562	14,549	60,852
United States	372,354	385,614	875,338	258,938	247,777	337,164
Other countries . . .	50,038	122,317	48,817	14,377	26,460	19,534
Total imports . . .	1,074,541	2,137,166	3,774,815	436,118	652,050	779,565

In the year ending March 31, 1919, therefore, the United Kingdom supplied 71 per cent. in quantity and 46 per cent. in value, while the United States furnished 23 per cent. in quantity and no less than 43 per cent. in value. The extraordinary discrepancy between the quantity and value of the British imports, as compared with the American, is probably accounted for by the fact that the British dyes were supplied principally for the use of the mills at reasonable rates, whereas the American dyes were largely sold to Indian importers at the inflated rates ruling in the bazaar. The Japanese dyes imported have not met with very great success, and there are many complaints with regard to the strength of the colour.

(To be concluded.)

EXPORT OF INDUSTRIAL EXPLOSIVES.—The Board of Trade announce that the present Open General Licence for the export of explosives, etc., has been withdrawn and an Open General Licence has been issued for the export of industrial explosives, smooth-bore guns, and munitions for use therewith, to the following destinations:—British Possessions and Protectorates; French Possessions and Protectorates; United States of America; South America; Japan and Korea; Asiatic Russia; France, Belgium, Spain, Portugal, Greece, Italy, Holland, Switzerland, Serbia, Roumania, Norway, Sweden, and Denmark.

SALTERS' COMPANY AND SCIENTIFIC PROGRESS.

DISTINGUISHED CHEMISTS ENTERTAINED.

IN their historic hall, St. Swithin's Lane, the Salters' Company, on Thursday evening (December 11), entertained a large number of distinguished chemists to dinner. The guests included Lord Moulton, Sir James Dobbie (president of the Chemical Society), Sir William Pope (ex-president of the Society and Professor of Chemistry at Cambridge University), Sir Herbert Jackson (president of the Institute of Chemistry), Mr. John Gray (president of the Society of Chemical Industry), Mr. R. G. Perry (chairman of the Association of British Chemical Manufacturers), and others.

The occasion was the first dinner the Company has held since the war, and the Master (Mr. W. B. M. Bird) gave an account of the recently established Salters' Institute of Industrial Chemistry, of which Dr. M. O. Forster is director. The Institute was founded with the object of promoting the application of chemical science to industrial processes, and with this in view several post-graduate fellowships have been awarded during the year, and are now held at various colleges and universities by young chemists whose training was interrupted by the war and whose desire was to devote themselves to the chemical industry. In addition to these benefactions, grants in aid have been given to a considerable number of young men employed in chemical factories in or near London and who desire to improve their knowledge of chemistry by attending evening classes.

This effort, the Master proceeded, was merely a beginning. Other City Guilds would no doubt follow the example of the Salters' Company and realise that their justification lay in rendering assistance to the trades which bore their names. It was only by successful trade that we would be able to grapple with the enormous debt the war had thrown upon us and avert national bankruptcy. (Cheers.) He proposed the toast of "The Salters' Institute of Industrial Chemistry."

Dr. Forster, replying, announced that the City Guilds had contributed £1,000,000. for the advancement of technical education, of which £40,000. was given by the Salters' Company.

Sir William Pope, replying to the toast of "Science and Industry," said that by endowing fellowships for the training of young men the Salters' Company were doing a work of great national value. The scheme was destined to play a considerable part in providing chemists which the technical industries of this country were demanding so insistently at the present time.

Mr. R. G. Perry also replied, and said that for 100 years the chemical industry had been entirely free from labour unrest. He thought that of all the industries of this country, that which contained the greatest number of educated men was the chemical industry, and as a direct consequence of this mixture in intelligence the labour problems of both sides were better understood, and the difficulties which surrounded other industries did not arise in the chemical trade. There was no better way of securing co-operation between masters and men than by affording increased facilities for technical education and research. State control of industry was not a panacea for our evils. What we wanted was the utilisation of the great trade organisations like the Salters' Company and others. If the Government departments would tell those great organisations what they wanted and when they wanted it, private enterprise would do the rest.

AMERICAN FOREIGN TRADE IN GLYCERINE.

AS a direct result of the war the United States trade in glycerine, according to the Bureau of Foreign and Domestic Commerce, has been completely revolutionised. Imports ranging from 20,000,000 to 40,000,000 pounds annually for a decade and a half prior to 1914 dwindled to a little over 1,000,000 pounds in 1919; and the increase in the production of glycerine in the United States since the outbreak of the war has been such as not only to supply in large measure the enormously expanded domestic consumption but also to make possible the exportation of 21,000,000 pounds in 1918 and 13,000,000 pounds in 1919.

The world production of crude glycerine prior to the war has been stated to be 40,000 tons per annum, 14,000 tons of which were from soap manufacture and 26,000 tons from stearine manufacture, of which England produced 5,500 tons, France 3,500 tons, the United States 3,000 tons, and Germany 2,000 tons from soap-making; and France 6,000 tons, Germany and the United States 3,000 tons each, Holland, Austria, and Russia 2,000 tons each, with smaller amounts in other countries, from the manufacture of stearic acid.

IMPORTS.

From 1884 to 1910 France led as a supplier of glycerine to the United States, with the exception of the year 1900, when the United Kingdom sent a slightly larger quantity. England ranked first in 1911, 1912, 1913, and 1915, France again in 1914 and 1916; and in 1917 imports of glycerine from these countries ceased, to be resumed with shipments aggregating only 102,655 pounds from the United Kingdom in 1919. With the outbreak of the war the United States had naturally to seek other sources for a goodly part of such glycerine as it continued to import. Cuba had long been a shipper of glycerine, and sent steadily increasing quantities each year from 1914 to 1918, but shipments declined somewhat in 1919. Canada contributed important amounts in 1914 and 1915, as did Mexico also, though there has been a decided drop in the shipments from the latter country to the United States dating from 1916, and shipments from the former entirely disappeared in 1918—to reappear, however, in 1919. Argentina and Brazil, and in lesser degree Uruguay, Venezuela, and Japan, have been the chief new sources of supply.

No accurate statistics are available showing the production of glycerine in the United States since the census taken in 1914. One of the war boards no longer functioning ventured an estimate of 70,000,000 pounds of crude glycerine as the domestic output in 1917. The Bureau of the Census gives the production of crude glycerine for sale in the calendar year 1914 as 16,568,920 pounds, valued at £456,000., but adds that figures are not available for the total production of crude glycerine as that made and consumed in the manufacture of the refined glycerine was not reported. The refined glycerine made during the same year amounted to 60,944,799 pounds valued at £2,156,000. This glycerine was produced in 119 establishments, 19 of which were located in New York and the same number in Ohio, 12 in Illinois, 10 in Pennsylvania, 9 each in California and Massachusetts, and the others scattered throughout the States.

Comparing these figures with the domestic exports of crude glycerine aggregating 21,045,991 pounds in the year ended June 30, 1918, and 13,018,882 pounds in the fiscal year 1919, while imports dropped to 1,875,531

pounds in the former year and to 1,171,679 in the latter, and in view of the well-known fact that enormous quantities of domestic glycerine were utilised in the increased manufacture of explosives in the United States since 1914, it is evident that tremendous expansion in the recovery of crude glycerine has taken place since the war began, no estimate of which would be more than guesswork until returns are available.

EXPORTS.

Glycerine made in the United States was exported to 54 countries during the fiscal year 1918, 91 per cent. of it going to Europe. The bulk of the 21,045,991 pounds exported in that year went to allied countries, Italy taking 18,886,974 pounds, Canada 1,436,922, England 214,953, France 100,940 pounds, and Japan only 80,917 pounds. Following the signing of the armistice there was a radical change in the destination of American exports of glycerine. Compared with the previous year, shipments to Italy show a sharp decline in 1919, none whatever having been made during the last half of the year, while those to the United Kingdom and Japan materially increased. Larger amounts are also going to South America. Further, a movement to oriental markets may be noted. The principal countries to which the domestic glycerine exported during the year ended June 30, 1919, went were:—

Exported to—	Pounds.	Value.
United Kingdom	6,840,022	\$3,873,393
Japan	2,515,513	1,136,244
Italy	1,713,636	937,144
Canada	1,022,824	600,696
Norway	262,930	57,926
Argentina	113,994	37,775
Cuba	87,561	34,040
China	66,485	21,067
British India	42,858	11,951
Total to countries named.....	12,695,853	6,710,236
Total to all countries	13,018,882	6,833,432

Nearly the whole of the amounts credited above to the United Kingdom and Canada was shipped prior to January, 1919. In normal times the British production of glycerine is more than sufficient to supply both England and Canada, while Italy finds a more convenient source of supply in France than in the United States if its own production fails to fully meet all demands.

A decline in the United States' export trade in glycerine during the last fiscal year is strikingly shown by comparing the total shipments for the first six months (July-December, 1918), amounting to 10,318,717 pounds, with the 2,700,165 pounds for the second half, ending with June, 1919. That this decline, in comparison with corresponding figures for 1918, still continues is shown in the shipments for July and August, 1919:—

Period.	Pounds.	Value.
July:—		
1918	485,985	\$245,164
1919	67,980	15,659
August:—		
1918	570,405	340,768
1919	391,154	82,956
8 months ending August:—		
1918	12,492,401	6,425,540
1919	3,158,899	1,005,019

A factor of prime importance to be considered if the United States is to maintain an export trade in glycerine is the difference in the rate of exchange. It is stated that the present rate is such as to make purchase of foreign glycerine possible in the United States at a price considerably below domestic quotations.

ALCOHOL FROM COAL.

THE extraction of alcohol from coke-oven gas on a commercial scale was proved to be possible at a meeting of the Cleveland Institution of Engineers at Middlesbrough by Mr. Ernest Bury, of the Skinningrove Iron and Steel Works. In a paper read before the Institution on Monday Mr. Bury showed that at the Skinningrove Works he had succeeded in extracting alcohol and its derivatives.

The practical working of Mr. Bury's process at the Skinningrove Works, where 5,800 tons of coal are carbonised per week, has revealed an average yield of 1.6 gallons of alcohol per ton of coal carbonised, and as the total weight of the coal which was reduced to coke in this country in 1918 was 14,635,000 tons, the application of this process to the whole of this coal would yield, according to Mr. Bury's calculation, 23,416,640 gallons, the value of which would be £2,341,664. Having regard to the scarcity of liquid fuel, that in itself was important. Mr. Bury further pointed out that the recovery of the alcohol at the gasworks of the country would yield a further 27,000,000 gallons, or, taking alcohol and benzole together, the total quantity of liquid fuel available from extraction through the carbonisation of coal would be 114,000,000 gallons, to meet the country's present total requirement of 160,000,000 gallons per annum.

The process of extraction by contact with sulphuric acid is not a new discovery, but Mr. Bury has been the first to show its commercial practicability. His principal discovery is that the best results are achieved at a temperature of 60° to 80° C., and in his process he has carried the utilisation of heat from the coke-oven plant to the utmost limit. Ether, chloroform, iodoform, acetic acid, and acetone are among the derivatives he has obtained from the coke-oven gas after the benzole has been extracted, and at the meeting at which these results were disclosed some of the foremost metallurgists of the day, including Mr. J. E. Stead, paid tribute to the brilliant research.

CHINESE MARKET FOR DYES.

H.M. CONSUL-GENERAL at Tientsin reports that the requirements for the China trade in dyes are known to be so enormous that British firms in China, despairing of getting supplies from home, are endeavouring to make arrangements with manufacturers of dyes in other countries. One firm, who have for the last three years imported dyestuffs from Switzerland on a small scale, propose to decentralise the business and work on a broader basis. During the war, when stocks were low and prices high, it suited both parties to sell the whole stock as it arrived directly to one dealer in Shanghai. Now, however, that prices are falling and competition is beginning to be felt, the obvious method to meet the new circumstances is to sell to a number of dealers in Shanghai and the other large ports and end the monopoly.

A tendency recently displayed by some British firms, when they think that their trade marks have been sufficiently well established, is to send out their own representatives. Certain Swiss and French concerns have also sent their own agents. While the result of these experiments will probably not be encouraging, it is a possibility that must be borne in mind by firms

entirely dependent on the goodwill of the manufacturer for supplies.

Other firms are importing dyes from America, but are not very satisfied with either the goods or the business methods of American exporters. For the most part American exporters of dyes appear to be dumping abroad their surplus stocks rather than attempting to build up a real export business on scientific lines, though there are exceptions. The only colours in which American manufacturers have hitherto been at all successful are reds and blacks; Japanese dyes are very inferior; and the only competition to be feared from American or Japanese firms is if they should be in a position to import dyes from Germany on a large scale.

In this connection it should be mentioned that since the signature of the Peace Treaty Germans have been canvassing for and are reported to have booked orders for dyes; how they propose to ship them is not explained, unless it is in Japanese bottoms. It is, therefore, a point to be considered whether, if German dyes are to be exported in part payment of the indemnity, British firms should not have a share in the handling of them.

THIRTY YEARS AGO.

From the "Chemical Trade Journal" of December 21, 1889.

A New Sugar.—The French chemist, M. Maqueene, has discovered it through the treatment of the commercial pinite with iodhydric acid. It is a new sugar of the aromatic group, and is to be classed with inosite and quercite, hitherto the only saccharine substances obtained from benzene. It may be called to mind that the pinite here spoken of was discovered by Berthelot in 1859. It is the chief constituent of pine sugar derived from the sap of the *Pinus Lambertiana*, which grows so abundantly on the western slopes of the Sierra Nevada in California. As for the sweet-tasted inosite, it is found particularly in the ox's heart, in the urine of man in case of Bright's disease, and in French beans. Quercite is the very sweet substance which Eichler discovered. It is extracted from acorns, and has been called "acorn sugar."

White Lead.—A new method of manufacturing white lead is proposed by a M. Thibaut, according to which the workpeople are not to be brought in contact with the vapours from the metal. Instead of manual labour, M. Thibaut has a machine for "dividing the lead and preparing the mixture" (*qui divise le plomb et opere le melange*). With this machine, he says that two men can make 3,500kilos. of white lead in two hours, whereas by the ordinary method it takes two men a whole day of 10 hours to make 4,500kilos. Those familiar with white-lead making will be the best able to estimate the value of this contrivance if it has any. Many methods have been introduced, having in view, in addition to economy, the decrease of lead-poisoning and Saturnian paralysis.

Smokeless Powder.—A Berlin telegram says, in rectification of various newspaper reports, it is semi-officially stated that the German War Department has its supply of smokeless powder, of whatever kind, made at its own factories. An exception is to be made only in the case of the Rottweller Powder Factory to this extent, that that establishment will be entrusted with the delivery of a certain quantity of a kind approved by the War Department. The Dynamite Trust preparation, it is added, has absolutely nothing in common with that powder.

NATIONAL ASSOCIATION OF INDUSTRIAL CHEMISTS.—At a recent meeting of the Executive Council of the National Association of Industrial Chemists, a further increase in membership was reported, and the association has now appointed a full-time Assistant Secretary. It has also been registered under the Trade Union Act, and claims to be the only body representing analytical chemists in the United Kingdom which is so registered. With the newer powers thus granted to it, the association anticipates a considerable increase in its influence and in its ability to assist the economic condition and professional status of its members. Further particulars can be obtained from the Secretary, The White Building, Sheffield.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—The main object of the Nitrate Producers' Association formed in Chili nearly a year ago was to "stabilise" prices, thus preventing fluctuations prejudicial to the industry through the encouragement of speculation. Starting in September last with a limit of 9s. per quintal, f.o.b., for ordinary quality, the Association—now comprising all except the German and American oficinas—has raised its prices successively to 9s. 4d., 9s. 7d., 10s. 6d., and as *l'appétit vient en mangeant* it is now reported to have taken a further step to 11s., making a total advance of no less than 2s. per quintal, or 22½ per cent., within three months. So far so good, and if the present rate of appreciation is kept up, the fancy prices charged to the Allies two years ago will soon be seen again; but it remains to be seen whether the delivery of the nitrate will be as easy as the sale has apparently been. Out of the stocks on the West Coast, amounting to about 1,680,000 tons on December 1, about 1,425,000 tons are sold for shipment up to March 31 next, and the task would have been a difficult one even in *ante-bellum* times, representing as it does 350,000 tons per month. Now, however, tonnage is extremely scarce, and matters are complicated not only by coaling difficulties for the numerous steamers chartered, but by strikes at the Chilean ports. The December total is therefore likely to be again very disappointing, thus increasing the proportion of exports falling on January-March, and, as stated in our last issue, it is altogether improbable that the full quantity intended will arrive in Europe in time for next season. Continental consumers may have to go short of the fertiliser, but, fortunately, the requirements of the British farmer are already insured by stocks in this country and cargoes on passage—always supposing he is prepared to pay the exorbitant prices asked by importers. The best feature in the nitrate position is the considerable fall in freights on later 1920 shipments.

Sulphate of Ammonia.—This material, as the year ends, manifests a very sound undertone. There is a most pronounced demand from British farmers in all parts of the country; and while it is a demand prompted, of course, very largely by the fact that in the New Year their sulphate of ammonia will cost them more, anyhow, until the end of May, there is also to be recognised the fact that years of effective propaganda have borne exceeding good fruit during 1919. In the matter of export there is very little to be said. Small consignments go out, but at prices which apparently are fixed almost entirely by private treaty—from £25. to £28. being the favourite range of quotations. These, of course, compare with the current price of £21. for domestic use. When to the export price is added the heavy cost of freight, it is very clear that there are a good many farmers or manufacturers of manures abroad who are prepared to pay a substantial price for their sulphate. So far as the American position is concerned, it is declared that quite a serious situation has developed. Supplies of sulphate of ammonia are decidedly scarce, with several round lots of the product having been resold on as many as three occasions within two days. It is declared by recent advices from New York that the export demand reaching that centre is prodigious, with some record prices having been paid. American sulphate of ammonia manufacturers seem to be in no position to offer material at least for the first six months of next year, and there are reported to be some large orders in the market covering the output for the whole year.

Basic Slag.—The production of this material cannot keep pace with requirements. The Rothamstead Experimental Station reminds farmers that there are three distinct types of slag, which must on no account be confused. The first is the kind for many years well known to agriculturists, whilst the second and third types have come into prominence of recent years, and especially during the war. The three sorts are differentiated as follows: (1) Bessemer slag, containing phosphoric acid equivalent to 40 per cent. or more of tricalcic phosphate, largely soluble in 2 per cent. citric acid, usually 80 per cent. of the total guaranteed soluble; (2) basic "open-hearth" slag, containing less phosphoric acid, equivalent to 15 to 31 per cent. of tricalcic phosphate, largely soluble (80 per cent.) in 2 per cent. citric acid, the first pourings being richer than the last; and (3) basic "open-hearth" slag made by the use of lime and fluorspar, containing as much phosphate as the poorer grades of the preceding class, but only slightly soluble (20 per cent. or less) in 2 per cent. citric acid.

Other Fertilisers.—Fertilisers of all kinds are meeting an average demand for this time of the year from consumers, and the season looks like being a brisk one. Bone meals are very firm, and supplies still remain poor. Pure steamed 1 per cent. and 60 per cent. meal is still quoted at £13. 10s. to £14. per ton, with pure dissolved 3 per cent. and 32 per cent. bones at £15. to £15. 10s. per ton, always ex works. A good trade is passing in potassic superphosphate, 4 per cent. and 26 per cent., in bags, at £9. 2s. 6d. per ton. Superphosphate moves off fairly well, and is not regarded as too dear.

Dutch Fertiliser Industry.—The production of sulphuric acid and superphosphate in the Amsterdam Superphosphate Factory has been small during the whole working year ending June 30 last, although other sections of the concern were active. The net profit was 220,212 florins, against 799,400 florins in the preceding year. A dividend of 7 per cent. will be paid, against 13 per cent. in the preceding year. Prospects for the ensuing year are reported better than for last year. The United Chemical Factories, of Rotterdam, which are interested in the Amsterdam concern, have also had an idle year for superphosphate production, and are paying 7 per cent. on the ordinary and 6 per cent. on the preference shares.

Nitrate of Lime.—This material is again on the market, but now in granular form. Sales are being effected at £19. to £20. per ton, c.i.f. British port.

Aschersleben Finance and Prospects.—The Disconto Gesellschaft has negotiated the issue of two-and-a-half million new shares of the Aschersleben potash concern, plus ten million marks 4½ per cent. bonds, irredeemable before July, 1925, on the Berlin Bourse. These issues had been arranged for as far back as December last. The money is required for paying off bank credits and extending factory construction and pit sinking both for the company itself and its subsidiary companies. The activity of the concern depends, of course, largely on the labour question making the export business possible. The prospectus observes also that the loss of the Alsatian potash concerns and the development of the potash deposits in Spain have broken the German monopoly in this branch of industry, particularly in regard to the foreign sales and fixing of prices. The profit value of the German potash fields will, of course, be largely dependent on the possibility of arranging with the competitors.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

The position as regards fuel supplies to the tinplate factories has improved during the week, but it is still far from satisfactory. The abnormal demand for plates of every description continues. Given fair transport arrangements, manufacturers would soon be able to control the situation, and thus secure the foreign trade, which is so urgently required in order to meet the competition of American makers, who primarily rely upon quick dispatch of orders. Shipments of tinplates continue to be satisfactory, and it is confidently anticipated that Australia will become a much better market in the near future, the inquiries from that country being more numerous.

There is a satisfactory increase in the production of patent fuel, and export business is being extended. Foreign railways are taking to this form of fuel, and several large cargoes have been sent to them. During the week heavy consignments left Swansea, 5,319 tons being dispatched to Marseilles, 3,900 tons to Cette, 6,604 tons to Naples, 3,400 tons to Bordeaux, and 6,000 tons to Rouen. A cargo of 5,137 tons left Port Talbot for Mollendo, and one of 2,473 tons was sent from Cardiff to Rouen.

The copper trade is improving, and arrivals of copper ore are increasing. There is just now a strong demand for copper sheets for the shipbuilding yards.

An explosion, the cause of which is at present unknown, occurred at a powder magazine at Blaenavon blast furnaces on Monday, when two men were killed and another seriously injured.

The fertiliser trades are all busy. Basic slag orders are still behind in delivery, but makers are doing their level best in this respect, and customers are getting their supplies more promptly than has been the case for several seasons. The sulphate of ammonia manufacturers have plenty of orders on hand, and there is little or nothing left for export business.

The call for sulphuric acid has increased, and makers have become busy.

LEGAL INTELLIGENCE.

Appeal Case in Respect of Soap Contract.

On Monday, in the Divisional Court, before Lord Justice Warrington and Lord Justice Scrutton (sitting as additional judges of the King's Bench Division), the case of the Russell Oil and Chemical Company, Ltd., v. City Soap-powder Works, Ltd., was heard on the defendants' appeal from a judgment of Judge Ruegg at Birmingham County Court.

The grounds of the appeal were that, on the facts as admitted or proved at the trial, judgment should have been entered for the defendants; that plaintiffs were not entitled to the relief claimed nor on the claim as amended at the trial to the amount recovered or to any sum whatever; there was no evidence that the defendants ever refused or neglected to deliver goods sold or that the consideration for the price paid by the plaintiffs had wholly failed; the consignment of goods complained of at the trial were not part of the parcel of two tons which the defendants were alleged to have refused to deliver; alternatively, if they were, the plaintiffs accepted them and made no claim in respect of their defects, and the learned judge was wrong in holding that the plaintiffs were entitled to or had, in fact, treated an accepted consignment of part of the goods as a repudiation by the defendants of this contract or as a refusal to deliver the balance; the learned judge was wrong in law in admitting evidence as to the nature and quality of the goods delivered which the plaintiffs had accepted and fully paid for, and in respect of the alleged defects of which no claim was made and no damages were recovered.

Defendants asked for an order that the judgment of His Honour Judge Ruegg, dated April 29, 1919, be set aside and judgment entered for the defendants, or (in the alternative) that a new trial be ordered, and that plaintiffs be ordered to pay the costs of this appeal and of the trial below.

Mr. R. A. Willes, for the appellants, said the action which was tried by His Honour Judge Ruegg was commenced by a plaint in which the respondents claimed £100. damages for the neglect or refusal of the appellants to deliver certain soap, and in the result the respondents got judgment for £87. 10s. for money had and received. The learned County Court judge appeared to have taken no notes of the proceedings. There were certain discussions on questions both of fact and law, and there was an amendment of a particular claim. Counsel submitted that the judgment delivered was inconsistent with the claim, the amended claim, and the facts. He asked their lordships to decide that the delivery proved to be right, and that there was no evidence to support the view that the delivery was wrong.

Without hearing counsel for the respondents their lordships dismissed the appeal with costs.

Fumes from Explosives.

An inquest was held at Nuneaton on Friday of last week on the body of Ernest Rowe, Bermuda, Nuneaton, a miner at Griff Colliery, who died suddenly a few weeks ago. The inquest had been adjourned for the explosives used at the pit to be analysed, and for the effect of the fumes therefrom on human beings to be ascertained.

The widow stated that on several occasions recently deceased had complained of pains in the stomach and chest after coming from work. On Monday, November 3, he again complained, remarking that the fumes from the explosives in the pit would kill him. On the morning of his death he got out of bed and later he complained of a renewal of the pains, and expired immediately.

Joseph Mockford said Rowe had not complained any more than the rest of them about the effect of the fumes after the use of explosives. All of them had been affected, sometimes in the head, chest, stomach, and legs.

James Thorburn, research chemist employed by the makers of the Viking powder, said both No. 1 and No. 2 powders were used at Griff colliery, and both had passed the Government tests before being sent to the mines. Nitro-glycerine was the component part which would be likely to produce poisonous effects. Following the explosion, however, it disappeared as nitro-glycerine. The nitrogen was set free into the stall, but was absolutely harmless. This was the first case of the kind he had known. He had no knowledge of anyone having given up work in the manufacture of this explosive. Following an explosion from Viking, carbon monoxide was not present in such large quantities as to be cumulative in its effect, as with proper ventilation it would be a fight

between this and oxygen, and the latter being in such large quantity would win. If, however, carbon monoxide became cumulative, and it could not get in touch with oxygen, it would, in the course of time, kill a person.

Dr. Price said the man's death might have been accelerated by the effects of the fumes given off by the powder after the explosion. Deceased's heart was fatty and enlarged.

Dr. Nason said his opinion was that death was due to latent heart disease.

The jury returned a verdict of "death from syncope," caused by fatty degeneration of the heart, probably accelerated by poisonous fumes discharged during the shot firing.

Alleged Damage by Picric-acid Fumes.

The action brought by the owners of the Crow Nest estate, Lightcliffe, Halifax, against Brookes' Chemicals, Limited, Lightcliffe, for damage to the estate by the manufacture of picric acid, was concluded in the High Court on December 11.

Mr. W. J. Waugh, K.C., for the plaintiffs, contended that the residence had been rendered intolerable by fumes and by continuous pollution of the stream, turning both it and the lake yellow, and the herbage as well. What man would live in a house rated at £400. under such conditions? Sir Titus Salt lived in the house, and Mr. Kershaw after him, until 1917, and there was no evidence that the premises had ceased to be residential until defendants' works were erected. It was paltry of the defendant to offer a little over £7,000. for the estate after he had ruined it. He afterwards gave £13,400. for it, while it was previously valued at £25,000.

Mr. Pollock, official referee, in giving judgment, said that in his opinion there was no fundamental injury to the estate. The fumes ceased at the Armistice, and the pollution of the stream would soon end. Having seen the premises, he agreed with the defence that it was not suitable as a residential estate. The house was such that it would be very difficult to let. The case failed on the ground of permanent injury, and beyond that the plaintiffs would not be able to recover damages because they obtained the full value of the estate at the sale. There would be judgment for the defendants with costs.

Quality of Basic Slag.

At Crediton, North Devon, last week, Messrs. H. Norrington and Son, Ltd., Exeter, were summoned for selling basic slag for use as a fertiliser and causing or permitting the invoice to be false in a certain material particular—namely, that the basic slag had 39 per cent. of phosphates, whereas it contained only 17 per cent. A second summons was for failing to send an invoice on or after delivery of the goods. It was stated that the difference in cash value on the 18 tons sold by Messrs. Norrington was £44.

The defendants explained that at the time this contract was made slag was difficult to obtain. When the purchaser pressed for delivery the employee who had the details of the matter in hand was on holiday. Another employee, knowing that there was a consignment at the railway station, told the buyer to help himself. The bags of this consignment were marked "Ruby," and this showed there was no intention to defraud. The invoice was made out on the assumption that the right kind had been supplied. The defendants regretted the clerical error, which, when pointed out, was corrected.

The magistrates imposed a fine of £2. 10s. on each summons, and costs.

Heads of Departments and Notice: Important Decision.

A case of considerable importance was heard in the Bow County Court on Friday (December 12) before Judge Graham, K.C. The plaintiffs were Messrs. Jenson and Nicholson, Ltd., of Goswell Works, Wharton Road, Stratford, paint, varnish, and chemical manufacturers, and they sued Mr. Sidney G. Lee, accountant, to recover £25., damages for his having left their employ without sufficient notice.

The plaintiffs engaged the defendant as the head of their accountancy department at a salary of £25. a month, and he started his duties on April 1. All went well till September, when on the 7th he wrote a letter giving a month's notice. It was pointed out to him that his position was such that three months would be a more adequate notice, and that he had been promised £100. a year increase at the end of twelve months. He said he was sorry to leave, but

his wife had been ordered to the seaside for her health, and he was bound to go; he agreed, however, to stay on till October 31. As a matter of fact, however, he went off on October 4, saying he had to go. They were bringing the action as, owing to the large amount of labour they employed, they wished to establish the principle that a man could not go off just when he liked, and throw the work of the business into confusion. In this case £500 statements were delayed three weeks, representing a sum of £20,000. They had to call in an accountant to put the matter straight, whilst they were now having to pay his successor £41. 13s. 4d. a month.

For the defence, Mr. Lee said he had always been treated with great kindness and consideration by the firm, and was sorry he had to go, but the doctor said it was imperative for the sake of the health of his wife. He accepted a post at Walton-on-the-Naze at less money than the defendants paid him. Defendant went on to say that he acted on legal advice when he left.

Judge Graham said it was quite clear the defendant had no right to have left in a broken month, and had acted very unwisely in doing so. He considered plaintiffs entitled to damages, and awarded £15. and costs on "B" scale.

Leave to appeal was asked for and granted, although Judge Graham told the defendant he considered the case hopeless for him.

Customs Seizure of Pyrogallie Acid.

A considered judgment of great importance was delivered on Wednesday by Mr. Justice Sankey in the King's Bench Division, who held that a Proclamation by the Crown prohibiting the importation of pyrogallie acid from the United States was illegal.

The case came before the Court on the application by the Attorney-General for a declaration that the forfeiture by the Customs authorities of six cases of pyrogallie acid which was consigned to Messrs. Brown and Forth, of Dolefield, Manchester, from the United States, was legal. The seizure was carried out under a Proclamation of June 25 last, which the defendants said was illegal and of no value.

In his written judgment Mr. Justice Sankey said it had been argued by the Attorney-General on behalf of the Crown that he was entitled to a declaration for the forfeiture and seizure of the six cases of pyrogallie acid which had been consigned to the defendants. By the Prohibition of Imports Proclamation, 1919, the Crown, purporting to act under Section 43 of the Customs Consolidation Act, 1876, prohibited the importation into the United Kingdom of chemicals of all descriptions except under licence. Section 43 provided as follows: "The importation of arms, ammunition, gunpowder, or any other goods may be prohibited by Proclamation or Order in Council." The argument for the Crown was that the words in Section 43 meant what they said, and that His Majesty was entitled to prohibit the importation of goods of any sort or description into this country. On behalf of the defendant it was contended that the familiar rule of construction known as *ejusdem generis* should be applied to Section 43, that general words following particular words should not be narrowed, and that the section should be read so that the general words should be construed to mean the same as the particular words—viz., goods of the same sort as arms, ammunition, and gunpowder. Further, the defendants contended, that in any event the Proclamation was bad because of the exercise of dispensing power, and there was no right in His Majesty to make exceptions in the class of goods not to be imported. He could prohibit the import of goods altogether, but he could not prohibit the importation from one country while allowing it from another. If Parliament had wanted to confer power to prohibit importation of all goods they need not have used any particular words, but might have said generally that the importation of all goods could be prohibited. For these reasons he was of the opinion that the *ejusdem generis* rule must be applied to the construction of Section 43, and that the general words must be applied to the construction of Section 43, and also that the general words must be restricted to the meaning of the particular words. These words "any other goods" meant arms, ammunition, and gunpowder.

The Attorney-General had also argued that he was entitled to succeed on the ground that pyrogallie acid was of the same class as goods as arms, etc. He had been instructed to argue that the acid was used in photography and photography was used for war. It might be just as well quoted, said his Lordship, that for the same reason bread

and meat could be prohibited from importation because they were used to feed soldiers. In fact, it was hard to conceive any article that was not used in modern warfare. Consequently his Lordship, on the facts and law, found that this acid was not of the same class as the articles mentioned in the Section.

Finally, it must be recollected that the section was a penal one, and must in consequence be strictly construed. In his view, therefore, it would not be proper to hold that Parliament intended to impose the penalty demanded in this case by words which were uncertain and equivocal. He came to the conclusion that His Majesty had no power to make the Proclamation in question, and that it was illegal and invalid. He therefore gave judgment for the defendants with costs.

Leave to appeal was allowed on terms.

Phosphate for Munitions: Prize Court Decision.

The President of the Prize Court has delivered judgment in the action in which the Svafvelsyrre Fabriks Aktiebolaget claimed damages from the Crown, or, alternatively, the fair value of a cargo of phosphate rock on the Consul Olsson, in respect of which the appraised value of £16,420. was paid into court by the Crown after the Government had requisitioned the cargo. The Crown had "released" the goods as innocent of enemy interest upon investigation.

His Lordship, in his judgment, disallowed the claim for damages and costs against the Crown for unwarrantable seizure, holding that the seizure and proceedings in prize were warranted by the information in the possession of the Procurator-General, and that no steps were taken for any indirect purpose alleged by the claimants either to induce guarantees from Sweden against the exportation of phosphates, or to direct the flow of neutral phosphates to this country. On the score of appraisement, however, he found in the claimants' favour. The value of phosphates in the making of certain explosives was well known, and the question here was whether a fair value should be paid for the phosphates taken by the Crown irrespective of appraisement, or whether the £16,420. paid into Court under the Crown's certificated appraisement was, in fact, adequate. It was material, as a point of law, that the appraisement made by the Crown was not an appraisement acquiesced in by the claimants. They had no notice of it. The cargo was shown to have been valued merely as a cargo of phosphates undisposed of in an English port, of which no buyer was in view. It took no account of the Swedish demand for phosphates, and none of the urgent demand there then was in England for phosphates for munitions of war. He found that the actual value of the cargo must be ascertained by the Court, if it could not be agreed, and the claimants must receive any such sum by which the amount was proved to exceed the sum paid into Court.

Mr. Wright, K.C., for claimants, suggested that failing an agreement, it might be better that his Lordship should indicate the proper sum and not the Registrar.

His Lordship said he had considered that. He had acquainted himself with the facts of this case, and probably he could take the inquiry more briefly than anybody else.

Heavy Loss on a Seap Contract.

At the London Bankruptcy Court on Wednesday before Mr. Registrar Hope, the public examination was appointed to be held of Sarah Alice Duffield, residing at 29, Lichfield Street, Burton-on-Trent, and W. H. R. Weller, residing at 19, Bouverie Road, W., Folkestone. The joint statement of affairs showed gross liabilities amounting to £8,508. 11s. 2d., and assets, consisting of stock in trade, valued at £50., thus leaving a deficiency of £8,458. 11s. 2d.

The Receiving Order was made on the petition of a creditor on April 29 last. The firm had dealt principally in soaps and tinned goods, and the failure was attributed to a judgment for £3,500. being given in an action brought against the firm in respect of certain soap which was alleged not to be up to the standard guaranteed, and which was afterwards sold at a heavy loss; also to the cancellation of large contracts by the firm bringing the action, and to the absolute stagnation of the soap market, owing to the prohibition of export and fears of the result of Government control.

The Official Receiver said he had received a letter from Mr. Duffield stating that his wife was very ill and quite unable to attend for public examination. Under the circumstances the Official Receiver asked that the examination might be adjourned *sine die*, but the learned Registrar decided to adjourn the examination generally with liberty to apply.

ITEMS OF INTEREST.

GERMAN DYES FOR BRITISH USERS.—According to the *Manchester Guardian*, about 650 tons of German dyestuffs are now in Manchester awaiting distribution.

PERSONAL.—Dr. Cecil H. Desch, of the Royal Technical College, Glasgow, has been appointed Professor of Metallurgy at Sheffield University in succession to Dr. Arnold, who recently resigned and has been elected Emeritus Professor.

OIL-FUEL STORAGE AT LIVERPOOL.—According to the *Liverpool Post*, steps are being taken by four of the leading oil companies to make Liverpool one of the largest oil-supplying ports in the country by the erection of huge storage tanks on land belonging to the Mersey Docks and Harbour Board.

A CORNISH MINING ARRANGEMENT.—A circular has been issued to shareholders of the Geevor Tin Mines, stating that a provisional arrangement has been made by the directors with the Levant Mines Committee under which the respective undertakings will be worked on lines which are expected to have a far-reaching effect on the future of both companies.

COMPLIMENTARY DINNER.—At the Victoria Hotel, Manchester, on Tuesday, December 9, the staff of Messrs. Millward and Co. (Drysalters) Ltd., Manchester, entertained their two governing directors—Mr. F. T. T. Reynolds, J.P., and Mr. Percy Cryer—to dinner. After the loyal toasts had been proposed by Mr. J. H. Gregson (director), Mr. Wignall (chairman), the oldest member of the staff, proposed "Our Guests and Success to the Firm."

EXPLOSION.—An explosion took place at Nobel's Ardeer Factory, Stevenston, on Thursday (December 11), and one man was killed. The accident occurred on a "hill" in the blasting explosives department. A quantity of nitro-glycerine was being washed, when there was an explosion, and the house and contents were blown up. There was only one man on the "hill" at the time, John Curr (33), and he was killed. The explosion caused considerable alarm in the neighbourhood, and was heard over a wide area.

PROPOSED AMERICAN PLATINUM CORPORATION.—A Bill has been introduced into Congress providing for the incorporation of the United States Platinum Corporation, with capital stock of \$30,000,000., the object of which is to secure a concession from the Government of land areas in Alaska containing platinum sands, and to pay for such privileges, as a royalty or subsidy, one-eighth of the net products obtained from the working of the concession. The operation would be under the jurisdiction of the Treasury Department.

JAPANESE-AMERICAN ALUMINIUM COMPANY.—Representatives of an American aluminium concern have recently arrived in Japan to confer with Japanese aluminium interests in the formation of a company, the proposed capital of which is yen 10,000,000, the Americans to take one-half the shares and the Japanese the other. The parties are in negotiation with the Japanese Government for water-power rights in Toyama Prefecture. The American company, having agreed to transfer to the Japanese company all its manufacturing rights and technical experience, do not wish that the shares to be offered in Japan should be open to public subscription.

GLAUBER'S SALT IN SIBERIAN LAKES.—The following is an estimate of supplies of precipitated Glauber's salt in some of the Siberian lakes: (1) The Great Marmyshansk Lake, 144,000,000 poods (2,600,000 short tons) of crystalline salt ($\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$) and 22,000,000 poods (397,210 short tons) of evaporated Glauber's salt; (2) Little Marmyshansk Lake, 25,000,000 poods (451,400 tons) of crystalline salt; (3) Lake Tuskal (Minusinsk district), up to 100,000,000 poods (1,805,500 tons) of crystalline salt; (4) Lake Varche (Minusinsk district), up to 100,000,000 poods (1,805,500 tons) of precipitated crystalline salt and an enormous quantity of Glauber's salt in solution.—*U.S. Com. Rep.*

BUSINESS NOTICES.—Messrs. Holt, Thompson and Co., Ltd., fine chemical manufacturers, Liverpool, inform us that they have acquired the whole of the fine chemical business of the Bradford Wool Extracting Company, Ltd., of Pit Lane Mills, Bradford, and are transferring the entire plant to their own works at Binns Road, Liverpool.—Messrs. K. L. Allan and Co., lubricant manufacturers and merchants, The Albany, Liverpool, have taken over Messrs. J. B. and J. Atherton, Ltd., as a going concern, and have developments in view. Large works at Rainford have already been bought, and are being equipped. Mr. J. B. Atherton has joined the board of Messrs. Allan's, and has been appointed chairman.

MALAY TIN EXPORTS.—The exports of tin from the Federated Malay States in November amounted to 2,972 tons, compared with 3,221 tons in October and 3,131 tons in the corresponding month last year. The total export for eleven months of the present year was 34,454 tons, compared with 34,337 tons in 1918 and 36,308 tons for the corresponding period of 1917.

SOUTH AFRICAN NITRATES.—In the Government report on the nitrate deposits in the Priestra district of South Africa it is stated that the costs for crushing, leaching, etc., will probably amount to from 4s. 6d. to 5s. 6d. per ton of rock, and that the total costs of producing commercial nitrate will come to from 10s. to 13s. per short ton of rock handled. The rock contains some 12 per cent. of recoverable nitrates.

EXPORT OF OLIVE OIL FROM SPAIN.—A Spanish Royal Order has now been issued (No. 160, dated November 18) in virtue of which export licences for olive oil are to be issued, to those who have sent in offers of deposits, to the extent of 20,307,514 kilograms. These export licences, when issued, are to be valid until March 15, 1920, for consignments packed in hogsheads, and until May 1, 1920, for consignments packed in tins bearing printed Spanish marks.

STOCKS OF NON-FERROUS METALS.—The Ministry of Munitions announce that the following stocks (exclusive of old metal and scrap) in this country were in their possession on December 1, 1919: Copper, 14,867 tons; spelter (G.O.B.), 12,848 tons; spelter (refined), 10,940 tons; aluminium, 8,911 tons; soft pig lead, 59,912 tons; nickel, 1,800 tons; antimony regulus, 2,950 tons. A proportion of the above stocks is already sold to the trade for forward delivery.

ELECTROLYTIC ZINC COMPANY'S CAPITAL.—According to a Melbourne advice, it is reported that in the New Year the Electrolytic Zinc Company will require further capital for the extension of the Ridsdon works. New shares will be offered to Amalgamated Zinc, Ltd., the North and South Broken Hill Companies, and the Zinc Corporation, Ltd., in the proportion of their holdings. These companies will offer shares to individual shareholders for subscription. The ultimate outlay on the Ridsdon works is estimated at £1,500,000. So far only £500,000. has been expended.

ELECTROLYTIC DISINFECTING FLUID.—During the year 1918, according to the report of Dr. F. W. Alexander, Medical Officer of Health for the Borough of Stepney, 30,750 gallons of electrolytic disinfectant were manufactured, making 61,500 gallons as diluted for distribution. The cost was for materials £114., electrical energy £51., total £165. Since the installation of the plant, a period of 13 years, 504,219 gallons of fluid have been manufactured at a cost for electricity of £786., and materials of £645.; previous to the war the cost was under ½d. per gallon, and even with the strong fluid which at present is being made, and is diluted, the cost is still about ¾d. per gallon.

FIRES.—A fire broke out in the sulphate storerooms at Lord Ellesmere's by-product works at Brackley Collieries, near Walkden (Lancs.), on Sunday morning. Lord Ellesmere's fire brigade kept the fire from the large stocks of benzole and other inflammable spirit and from the gas-producing plant, which lights the township of Little Hulton. The damage was extensive, the storerooms and large quantities of sulphate being destroyed.—Two Rochester barges, the Tom Tuff and Arthur, with cargoes of high explosives, were destroyed by fire in the Thames off Dagenham on Monday morning, and the barge Clanwood, lying alongside, was damaged. The fire-engines at first could not go near, owing to the explosions which occurred.

ACTIVE NITROGEN.—Some years ago Professor Strutt (now Lord Rayleigh) discovered that nitrogen, generally a sluggish gas, can be activated by the electric discharge under conditions which are still obscure to a certain extent. The active nitrogen has never been prepared in a pure state, and its constitution is unknown. Max Trantz suggests in the *Zeitschrift für Elektrochemie* of last September, that active nitrogen is N_3 , a body somewhat analogous to ozone O_3 , and that at any rate at very low temperature active nitrogen consists essentially of N_3 , and at ordinary temperature partly of N_3 . He believes at the same time that it will be impossible to prepare pure N_3 , because when cooled in the presence of N its active nitrogen passes into N_2 , and when heated it decomposes into N_2 . Lord Rayleigh's original opinion was that his active nitrogen was simply atomic nitrogen N , not molecular N_2 .—*Engineering*.

PARLIAMENTARY NEWS.

Oilcake.

In the House of Commons, Sir N. Griffiths asked the Food Controller whether he is aware that oilcake has recently been contracted forward from the mills at £10. per ton, and is now being retailed at prices ranging from £22. to £28. per ton; whether he will state what becomes of the intermediate profit in such transactions; and if he will state the present cost of such oil-cake ex works?

Mr. McCurdy: The Food Controller has no knowledge of any such sales of oilcake as those to which the hon. member refers. Certain quantities of palm kernel cake and rape cake have been sold at low prices, but farmers are for the most part unwilling to purchase these varieties, and prefer linseed and cotton-seed cake, the respective prices for which are about £25. and £19. to £20. per ton, ex mill.

Colonel Wedgwood: Is it not a fact that this extraordinary increase in the price of oilcake is largely due to the confining of the sales of palm kernels to a ring of manufacturers in this country?

Sir N. Griffiths: Is there any intention of taking control off these goods—oilcakes in particular?

Mr. McCurdy: I will inquire into the matters to which the hon. gentlemen refer.

Mr. McCurdy, in reply to a further question, said: The present maximum prices for oilcakes are fixed in accordance with the prices in the countries of origin of the seeds from which they are manufactured.

Import of Cement.

Sir A. Geddes, replying to Mr. J. Davison, said: The importation of cement is not restricted, and any difficulty in obtaining it from abroad is not due to the action of the Government.

Petroleum Storage Facilities.

Sir H. Greenwood, in answer to Sir W. Seager, said: The need of adequate storage facilities for petroleum is fully realised. A considerable amount of tankage has been erected or is projected both on Government and private account, and the position will be kept carefully under review.

Explosives Stores.

Mr. Kellaway, in reply to Mr. H. Jones, said: The number of magazines provided for the storage of explosives during the war was eighty-nine. Of these, fifty-four have been given up, and five more are being cleared prior to restoration to the owners. The annual charge based on present requirements is, approximately, £80,000.

Wolfram Contracts.

Mr. Short, on Monday, asked the Parliamentary Secretary to the Ministry of Munitions whether, since the armistice, any contributions have been paid or are due to be paid to certain firms because of the absence of a break clause in their contracts?

The Deputy-Minister of Munitions (Mr. Kellaway): In the case of one group of contracts placed overseas, through the agency of Colonial and other governments, for the whole Empire supply of wolfram, the producers refused to accept the break clause. This entailed additional expenditure estimated at £450,000.

Pulverised Coal.

Sir Arthur Fell asked the President of the Board of Trade if any action is being taken to develop the use of pulverised coal for smelting and power purposes; is he aware that the use of pulverised coal is spreading rapidly in the United States, and that the smelting works of the Steel Trust use this method only; if poor coal and coke and small coal can all be used by this process; and if there is, approximately, a saving of from 25 per cent. to 30 per cent. in its use?

Sir A. Geddes: Considerable development is taking place in the use of pulverised coal for smelting and power purposes in this country as well as in the United States. I am unable to say whether the saving is as high as that suggested in the last part of the question.

MANCHESTER COLLEGE OF TECHNOLOGY.—An appeal has been issued for the sum of £150,000. for the purpose of carrying out extensions at the Municipal College of Technology, Manchester.

CORRESPONDENCE.

What is a Catalyst?

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Your brightly written article, "What is a Catalyst?" brings home to us the inadequacy of definition, even when formulated by "scientific gents." Huxley pointed out that the dead soul of Peter Bell would not have been roused one whit from its apathy had he been told that "the primrose is a Dicotyledonous Exogen with a monopetalous corolla and central placentation." Similarly, those seeking enlightenment upon the nature of a miracle are merely stunned when they learn that it is "an abnormal exercise of constitutional sovereignty on the part of the very divine Ego, in respect of the subsistence of the cosmical selfhood of the metamorphosed non-Ego."

One of the most telling descriptive definitions is that attributed to a well-known French historical character who said, "When one man is attempting to explain a point which he does not himself understand to another who does not comprehend what he is saying, that is metaphysics."

The action of a catalyst might—etymologically speaking—be the converse, or opposite, of that of an analyst. This, however, certainly does not seem to fit the facts.

Is chemistry a branch of metaphysics?

Sir William Tilden, in his delightful book, "Chemical Discovery and Invention in the Twentieth Century," tells us that "catalysis is a process in which a chemical change, which without assistance proceeds either not at all or very slowly, is greatly accelerated by contact of the materials with a small quantity of some agent, called a catalyst, which remains after the reaction undiminished." At best, this can only be said to be correct within the limits of accuracy of our measuring instruments and of our powers of observation.

Criticising A. R. Wallace's views on Darwin's Theory of Natural Selection, Huxley wrote: "Mr. Wallace, presumably, believes in that correlation of phenomena which we call cause and effect as firmly as I do. But if he has even been able to form the faintest notion how a cause gives rise to its effect, all I can say is that I envy him," and a little further on, "In ultimate analysis everything is incomprehensible, and the whole object of science is simply to reduce the fundamental incomprehensibilities to the smallest possible number."

I fear we must leave it at that. In the present state of our knowledge we are certainly not in any position to dogmatise either upon the "how" or upon the "why" of catalytic action.—Yours, etc.,

ED. C. DE SEGUNDO.

Dashwood House, New Broad Street, London, E.C.

Waste-heat Boilers.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—On page 601 of your issue of November 29 one of your contributors suggests that unless a gas engine is of at least 500B.H.P. it does not pay to install a waste-heat boiler. If this remark is true of other boilers it is certainly not true of the "Bonecourt" patent waste-heat boiler; for only the other day a client wrote to us and told us that a "Bonecourt" boiler he had installed on his 250B.H.P. gas engine was saving him £5. per week in fuel and attendance. The return on his money is therefore in this case 140 per cent. per annum, probably one of the best investments which could be found.—Yours, etc.,

BONECOURT WASTE HEAT BOILER CO., LTD.

Parliament Mansions, Victoria St., London, S.W. 1.

December 16, 1919.

ZINC AND ZINC DUST PRICES.—In common with the rise in spelter, Australian high-grade zinc dust (88/92% metallic zinc) has firmed up to £80. per ton. There is a strong demand for the material on this basis, but practically nothing offering for prompt supply. Lower grades are obtainable at correspondingly cheaper prices. The price of Australian electrolytic zinc (99/95% purity) has been advanced to £48. per ton f.o.b. Australia for direct shipment to New Zealand, India, South Africa, and the Far East.

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The outlook is brightening steadily. The imminence of a settlement of the ironmoulders' strike makes almost certain the revival of business in the Cumberland and North Lancashire hematite pig-iron trade in the spring, and already Midland users of low phosphorus brands of iron, who have been hit by the strike, are commencing to put out feelers concerning their commitments three months ahead. Even if there is no expansion of the local production of steel there are good prospects of the Midlands greatly increasing their requirements of ordinary iron as soon as the strike is over. As a matter of fact, however, the steelworks on this coast expect to be much busier in the spring, and in that case, of course, there will be a larger demand for the coke made at the by-product ovens here. But already production in the coking industry is being speeded up, and the ovens are now working five days a week, and though that does not represent full capacity it is a considerable improvement on the state of affairs existing last month. As more trucks become available more coke is carried across to the East Coast for shipment to Belgium and Switzerland; and when the ovens have both local and foreign needs to satisfy the industry will be overwhelmed. One effect of the greater liveliness in the coke trade is the falling off in the shipments of coal for the Irish market. East Coast coke supplies to West Cumberland this week are about 5,000 tons, and to the Furness district under 15,000 tons, and the increasing make of benzole is being eagerly absorbed. There is a duller demand for sulphate of ammonia, and tar, pitch, and creosote are all rather quiet.

There is a duller demand for sulphate of ammonia, and tar, pitch, and creosote are all rather quiet.

REPORTS OF COMPANIES.

Loders and Nocoline, Ltd.

The annual meeting was held in London on Thursday, December 11, Mr. W. F. Irvine, chairman of the company, presiding.

The Chairman, in the course of his address, said: A good demand for the company's products has been experienced since the removal of restrictions—in excess, indeed, of our present power of production; and, as stated in the report, large additions to the company's premises and plant have been authorised, and are now in progress. While this is the condition of trade at present—a condition which will probably last for some time,—there can be no doubt that the time will soon come when competition at home will become keen, while we shall, at the same time, feel the effects of the increased production of competing material in France, Belgium, America, and eventually Germany and Austria. In view of these considerations, your directors have felt for some time that the day would soon come when it would be difficult, however well equipped and staffed, for a factory dependent for its raw materials on merchants, who in some cases were themselves crushers and refiners, and relying on the other hand for many of its sales on firms who were already producing their own finished goods, and who in the near future may actually have a surplus for sale in competition, to maintain anything like the present level of profits. Your directors therefore decided that the time had come when it was imperative we should link ourselves up with some other group or organisation to secure permanently our supply of raw material, or to provide an outlet for our finished goods, or both. In the prosecution of their search for such support, your directors believe they have been successful, and you now have in your possession a circular explaining the details of a provisional transaction, which, we feel sure, you will recognise as one you can heartily ratify. The provisional agreement with the African and Eastern Trade Corporation, Ltd., has been adopted and ratified by holders of the requisite minimum number of shares, and has become absolute.

The report was adopted.

American Cyanamid Company.

Messrs. Sperling and Company announce that the American Cyanamid Company reports on operations during October as follows: Operations of the plant at Niagara Falls were on the basis of full capacity. At the ammo-phos plant at Warners, N.J., the manufacture of ammos-phos, temporarily suspended due to the cessation of phosphate rock shipments, was resumed. At the phosphate mines, Brewster, Fla., we were able to further increase our operations during the full mining operations; the drying and shipping operations during October were upon a substantial normal basis. The net value of the shipments of the various products for the month of October totalled \$693,953.49. Sales of the various products for the month of October represent a value of approximately \$1,108,000. Unfilled contracts as at October 31 represent a sales value of approximately \$3,390,000.

Low Temperature Carbonisation, Ltd.

The annual meeting was held on Monday in London, Mr. H. L. Armstrong (the managing director) presiding.

The Chairman said: The company's Barnsley plant was operated from April to September, and the results obtained were such that the engineering staff was able to report to the board on September 15 that the claims made in the past for the company's processes were fully justified. In view of this conclusion, we commenced negotiations for several large schemes to erect plants as soon as industry had settled down. A contract has now been arranged with an electric power company in Yorkshire to erect a plant and supply all the gas that can be made from the carbonisation of 500 tons of coal per day. This gas is to be burnt in the power company's boilers in place of raw coal; and since the electric company in question is one of the foremost in the country, and supplies its electric power at a very low rate, we are actually offering to supply them with gas at a price which shows a great saving over coal. Negotiations were then begun with an influential group of manufacturers situated in a great industrial district in Scotland, the object being to provide enormous quantities of power-gas for burning under boilers in place of coal, and our process lends itself so well to this scheme that it immediately found favour with the parties interested. Assurances

have been given that consumers whose aggregate consumption of coal is from 4,000 to 5,000 tons of coal per week will purchase gas from a super-carbonising station operated on our process as soon as erected. We are now getting out a plan by which this scheme can be worked on co-operative lines whereby the consumers will also be shareholders in the company. Negotiations are also practically complete for the erection of a plant to carbonise a minimum of 500 tons of coal per day near Sheffield. Although in all these schemes the only arrangements are those which have been made to sell the gas, large quantities of motor spirit, oil, smokeless fuel, sulphate of ammonia, chemicals, etc., will also be made and marketed. Work upon the above plants is expected to start next year, and will in all probability be handled by subsidiary companies.

Cassel Cyanide Company, Ltd.

Sir George Beilby presided at the annual meeting held last week in Glasgow, and, in moving the adoption of the report, said that two factors had operated during the war—a greatly reduced turnover and a lessened margin of profit. Within the last few months the demand for cyanide had improved, and German and American competition was already active in certain markets. The directors were fully alive to the need for improving their processes and methods of manufacture, especially having regard to the changed conditions, and much experimental work was being done. Several questions were asked, the Chairman stating in reply to one inquiring whether consideration had been given to the broadening of the basis of manufacture, that they had always been a highly specialised industry, but that consideration would be given to any suggestion. The report was adopted.

Courtaulds, Ltd.

At an extraordinary general meeting on Monday, Mr. H. G. Tetley, who presided, explained that the meeting was convened for the purpose of passing a resolution revising and extending articles of association with regard to reserves in relation to dividends and as to the position of affairs in Russia, on which some shareholders had asked for information. He said that, considering the state of Russia generally at the present time, it was uncertain as to whether there would be any sort of Government there at all. It was impossible to make any forecast as to the future of their business in that country. The resolution was carried.

Sapon Soaps, Ltd.

The net profit for the year ended September 30, after making various deductions, amounts to £8,234., which, with £4,335. brought forward, makes total available for dividends, etc., of £12,569. Dividend of 2½ per cent. for year on ordinary—viz., £2,500.—making total dividend distribution of £9,500., leaving to be carried forward £3,069. No dividend was paid on the ordinary for the preceding year.

Ropp Tin Company, Ltd.

Interim dividend of 50 per cent. (2s. per share). The directors recommend that the capital be increased to £168,000. by the creation of 465,000 shares of 4s. each.

DIVIDENDS.

MAZAPIL COPPER COMPANY, LTD.—Interim dividend of 7½ per cent. (1s. 6d. per share), less tax.

MERCHANDISE MARKS.—The Merchandise Marks Committee, which is considering the questions of indications of origin on goods and of national trade marks, met at the Board of Trade offices on Thursday and Friday of last week under the chairmanship of Mr. Harry Greer, M.P. Evidence was given regarding the present position of the matters into which the committee are inquiring, in so far as those matters affect the Board of Trade and the Customs, by Mr. H. Fountain, C.B., C.M.G., an Assistant Secretary of the Board of Trade in charge of the Commercial Relations and Treaties Department; Mr. Temple Franks, C.B., Comptroller-General of Patents, Designs and Trade Marks and Comptroller of the Industrial Property Department of the Board of Trade; and Mr. J. L. Mackie, an Assistant Secretary of the Board of Customs and Excise.

THE PATENT LIST.

PATENTS AND DESIGNS ACT, 1907.

APPLICATION FOR RESTORATION OF Lapsed PATENT UNDER SECTION 20.

Notice is given that William Innes and the National Lead Company, Limited, have made application for the restoration of the Patent granted to the said William Innes for an invention entitled "Improvements in or Connection With the Production of Lead Oxide and in Means or Apparatus Employed Therein," numbered 15,664, of 1912, and also of the Patent of Addition, No. 10,387, of 1913, both of which expired on July 4, 1919, owing to the non-payment of the prescribed Renewal Fee. Any person may give notice of opposition to the restoration by leaving Patents Form No. 16 at the Patent Office, 25, Southampton Buildings, London, W.C.2, on or before February 17, 1920.

W. TEMPLE FRANKS, *Comptroller-General*.

1919.

Method of Reducing the Viscosity of Viscous Solutions of Nitro-cellulose, Acetyl-cellulose, and Other Cellulose Esters. Carlsson, O.; and Thall, E. 22,187. **136,141**

Apparatus for Concentrating or Washing Ores and for Similar Purposes. Lesser, M. 25,529. **136,145**

Recovery of Zinc by Electrolysis. Electrolytic Zinc Co. 29,504. **136,151**

Production of Oxides of Nitrogen and a Catalyser Therefor. General Chemical Co. 30,090. **136,158**

Means for Producing Hot Air. Pedersen, H. A. M. 30,118. **136,160**

Process for Treating Sulphide Ores by Dissolution and Selection Through the Medium of a Neutral Solution of Certain Chlorides, Particularly Ferric Chloride. Soc. Anon. Minerais et Metaux. 30,233. **136,163**

Process for Neutralising Mineral Oils Which have been Treated with Acid. Gresaid, G. 30,379. **136,169**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Centrifugal Separators. W. Mauss, Johannesburg, South Africa. British Patent, 133,448, of 1918.

In centrifugal separators in which the separated solid is progressively deposited on a filter cloth through which the separated liquid passes away, the unseparated material is prevented from coming into contact with the filtering-surface. The separating-drum is made up of two conical members 1, 2 carried by a hollow shaft 3 and a solid shaft 7 respectively. The illustration shows the drum in separating position; the material is fed in by a pipe 5 to the cone 1 in the direction of rotation and passes down the cone to the filter

surface 8, which is arranged over a grooved plate 10. Solids 23 are deposited on the conical surface, and the liquid passes away through the filter to the chamber 11 and escapes through the recurved channel 13 to the receiver 16. After the separation has proceeded, the material passes over the rim 4, which is of greater diameter than the inner edge of the filter surfaces. The supply is then stopped, the drum is lowered into the receiver 17, and the two parts are separated, the lower part resting on the support 22. The solids then escape from the cone 1, and are thrown from the filter. The lower end of the shaft 7 is supported in a bearing carried by spring arms 14.

Motor Spirit. A.-de-feo Lopez, Buenos Aires, Argentine. British Patent, 133,434, of 1918.

A fuel for internal-combustion engines comprises alcohol partly etherified, as by bubbling it through a mixture of alcohol and sulphuric acid at a temperature of from 100 to 150° C., mixed with from 10 to 40 per cent. of unetherified alcohol and from 5 to 50 per cent. of a distilled hydrocarbon oil, the proportions being such as to give a mixture having a specific gravity of from 0.73 to 0.78.

Potassium Fluoride. E. E. and P. C. Dutt, Jubbulpore, India. British Patent, 133,474, of 1918.

A silicate mineral such as feldspar is treated at about 500-600° C. with silicon tetrafluoride and steam, and the mass is then lixiviated to dissolve out potassium fluoride. The solution is evaporated to dryness.

Carbon. Broxburn Oil Company, Glasgow; and R. H. Findlater, Broxburn, Linlithgow. British Patent, 133,452, of 1918.

The carbonaceous residue of the distillation of bituminous shales, cannel coal, etc., is ground, washed, and digested with sulphuric, hydrochloric, nitric, or hydrofluoric acid in a digester 5, the mixture is filtered in a press 13, and the filter-cakes digested in a digester 60 with caustic soda, the carbon being filtered off in a press 63 and washed with water, dilute acid, and then water. Alternatively, the material may be treated first with acid as described above, then with sodium carbonate, in which case some silica separates on cooling, and then with caustic soda. The acid extract collected in tanks 11 is filtered in a press 18 to remove any calcium sulphate which separates during cooling, and is then passed to saturators 24 arranged in two groups A, B and C, D used alternately. Ammoniacal gases which may be

derived from the shale distillation are passed in by a pipe 26 to the lower saturator A, the outlet gases passing by a pipe 27 to the saturator B, leaving finally at 28. When the liquor in A is filtered in a press 33, the liquor from B is passed into A, and fresh liquor is run into B. Alternatively, ammoniacal liquor may be used for this precipitation. The press-cakes from the press 33, consisting of alumina and iron hydrate, are digested with caustic soda in a digester 39, iron hydrate being filtered off in a press 42, and sodium aluminate solution being passed through a tank 46 and pipe 48 to towers 49, in which it is treated with gases containing carbonic acid, the alumina being finally separated in a press 53, while the sodium carbonate may be caustified for reuse. Any ammonia cooled in the digester 39 is passed by a pipe 67 into the saturators. The caustic-soda extract from the digester 60 is concentrated for sale as sodium silicate. The ammonium salt solution from the press 33 is withdrawn at 35 and evaporated.

Dyeing Compounds. V. H. Gatty, Whiteholme, near Preston. British Patent, 133,620, of 1919.

Vegetable fibres, yarns, or fabrics are dyed various shades by means of mixtures of oxides, hydroxides, or insoluble salts of copper and manganese. The process is carried out by impregnating the material with solutions of soluble salts of the two metals—e.g., sulphates, chlorides, or acetates,—removing surplus liquid, and then passing through a hot alkaline bath—e.g., hydrates, carbonates, or silicates of sodium or potassium or mixtures thereof. When salts of volatile acids, such as acetates, have been used, the colours may be developed by steaming. Light olive, brown, or fawn, to deep olive or brown shades are obtained.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Synthetic Resins. M. Melamid, Freiburg-im-Breisgau, Germany. British Patents, 133,712 and 133,713. Convention date, February 4, 1918.

Resinous compounds are prepared by the reaction of aromatic sulphochlorides on salts of organic acids of high molecular weight, such as resin acids, humic acid, or lignoceric acid. According to an example, naphthalene sulphochloride and sodium colophionate are used. The products are soluble in organic solvents or linseed oil, and may be used in making oil-varnishes.

Resinous compounds, according to the second patent, are prepared by the reaction of aromatic sulphochlorides upon coal-tar pitch; instead of pitch, its alkali-soluble fractions, or the heavy tar oils (anthracene oils) obtained in the manufacture of hard pitch may be used. The products are soluble in organic solvents, and may be used in the manufacture of varnishes.

Zinc Chloride. C. F. Burgess, Laboratories, Madison, Wisconsin, U.S.A. British Patent, 13,319. Convention date, September 26, 1918.

Zinc chloride is obtained by treating with chlorine in the presence of water, zinc, such as zinc scrap, spelter, galvanising dross, and zinc alloys high in zinc. Impure or dilute chlorine may be used, the residual gas being free from chlorine. When electrolytic chlorine containing hydrogen is used air may be added to avoid risk of explosion. Metals such as cadmium, lead, copper, tin, and antimony, if present, are removed from the solution by passing it over zinc, and iron precipitates as hydrate owing to the presence of basic zinc chloride in the solution. The zinc is placed in a tower 5 standing in a tank 7 having an overflow 8, and is supplied with liquor from a distributor 12. Chlorine is admitted at 9, and the heat of reaction may be absorbed by a cooling-coil 13. The solution overflows into a tank 14 containing zinc and a cooling coil 15, and is pumped up for use again by a pump 16 and pipe 17. Water is admitted when necessary by a valve 20, and strong solution is withdrawn at 19.

Glycerine. J. R. Eoff, Washington, U.S.A. British Patent, 133,374. Convention date, July 21, 1917.

Glycerine is produced by fermenting sugars with yeast in the presence of an alkali or alkaline salt, the proportion of alkali, etc., being just below that which inhibits the activity of the yeast. Acetic acid, alcohol, and acetone are obtained as by-products. Any yeast capable of acclimatisation in an alkaline medium is used. The yeast is first cultivated in sterile grape juice, and when in vigorous growth is added to a medium consisting of a wort made from malt sprouts, dextrose, and a yeast food such as Pasteur's solution, or a mixture containing ammonium nitrate, potassium phosphate, ammonium phosphate, magnesium sulphate, and traces of zinc and iron salts. When fermentation is active, sodium or potassium carbonate, phosphate, or hydroxide is added in successive doses up to the limit previously indicated. The "starter" so obtained, when fermenting vigorously, is added to a larger quantity of the medium, and alkali is added as before, the product being used for the manufacturing operation. The material treated for the production of glycerine may be either a solution of dextrose to which a wort obtained from malt sprouts is added, or "black strap" or other molasses, or purified and neutralised waste sulphite liquor. The temperature is maintained at 27.50° C., preferably 37° C., during the fermentation. In treating molasses, the initial stage of the fermentation is effected while the molasses is slightly acid, in order that the sucrose may be inverted by the invertase of the yeast. Afterwards, successive doses of alkali are added in the ordinary manner.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Farmers' Manure Company, Ltd., Royston.—Registered November 26, deb. securing all moneys due or to become due, to Barclays Bank, Ltd.; general charge. November 26, 1918.

Low Temperature Carbonisation, Ltd., London, E.C.—Registered November 22. Trust Deed dated November 7, 1919, for securing £150,000. 6 per cent. 1st mort. deb. stock; charged on freeholds in Wednesfield and Barugh, also general charge. (December 31, 1918.)

Midland Refractories Company, Ltd., Sheffield.—Registered November 24, £1,000. debts; charged on freehold hereditaments, Bull Bridge Brick Works, Ambergate (Derby), also general charge. (July 24, 1919.)

Mottram Chrome Tanning Company, Ltd., Mottram-in-Longdendale.—Registered November 19, mort. for securing all moneys due or to become due, to Lancashire and Yorkshire Bank, Ltd.; charged on freehold hereditaments in Elton, Bury. (September 19, 1919.)

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions. Orders, and Official and Other Notices.

Bechuanaland Copper Company, Ltd.—Resolved November 12, confirmed November 28: That the company be wound up. H. A. Allison, chartered accountant of J. Dix Lewis, Caesar and Co., Kennan's House, Crown Court, Cheapside, E.C., liquidator. Meeting of creditors at liquidator's, December 18.

Liquid Purification Company, Ltd.—Resolved November 21: That the company be wound up. C. G. Baron, 15, Copthall Avenue, E.C., chartered accountant, liquidator.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Carper, Faulkner and Co. (Joseph Burman Carper and Geo. Aubrey Faulkner), Two Waters Mills, Hemel Hempstead, oil refiners. November 17. Debts by J. B. Carper. (December 2.)

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

British India.

H.M. Trade Commissioner in India reports that a Calcutta firm desire to obtain agencies, to cover Bengal and the United Provinces, for United Kingdom suppliers of paints. A partner of the firm is now in England to discuss likely propositions. (Reference No. 1182.)

Canada.

A firm of manufacturers' agents in Toronto desire to represent United Kingdom manufacturers, for the whole of Canada, for drug specialities, soap, dyes, etc. (Reference No. 1185.)

The following inquiries have been received at the Canadian Government Trade Commissioner's Office, Portland House, 73, Basinghall Street, London, E.C. 2, whence further information may be obtained:—

A firm of manufacturers' agents in Ontario wish to get into touch with United Kingdom manufacturers of dyes (particularly blues and reds for colouring inks) who are desirous of extending their markets to Canada.

A firm of perfume manufacturers in Toronto wish to effect connections with manufacturers of, or dealers in, raw materials for perfumers, with a view to purchasing supplies.

A Canadian company manufacturing corundum, emery, and other wheels, also a variety of abrasive cloths and papers, is considering the appointment of a representative each in England, Scotland, and Ireland, and would be pleased to hear from responsible firms possessing a first-class connection among the engineering, shipbuilding, and similar trades.

British West Indies.

A general commission and shipping merchant at Port of Spain, Trinidad, desires to represent United Kingdom manufacturers of soap (ordinary in bars) for Trinidad and Venezuela. (Reference No. 1194.)

Denmark.

A trained chemist in Copenhagen desires to take up agencies for essential oils, drugs, waxes, and articles used in technical chemical factories. (Reference No. 1208.)

NEW COMPANIES.

Bengal Iron Company, Ltd.—Capital £2,500,000., £1. shares. Registered office: 17, Victoria Street, S.W.

Branscomb's Glassworks, Ltd.—Capital £50,000., £1. shares (25,000 7½ per cent. cumulative preference, tax free up to 6s. in the £). Registered office: 40, Chancery Lane, W.C.

Colombian Oilfields, Ltd.—Capital £1,000,000., £1. shares. Registered office: 10, Throgmorton Avenue, E.C.

General Petroleum Company of Trinidad, Ltd.—Capital £300,000., £1. shares. Registered office: 13, Copthall Court, E.C.

Powell and Ricketts, Ltd.—Capital £50,000., £1. shares. Registered office: Cheese Lane, St. Phillips, Bristol.

South Wales Fuel Company, Ltd.—Capital £125,000., in 120,000 shares of £1. each and 100,000 shares of 1s. each. Objects: To take over the business lately carried on by the Swansea Fuel Company, Ltd., at King's Dock, Swansea, and to enter into an agreement with Coal Treatment Processes, Ltd. Solicitors: R. S. Taylor, Son and Humbert, 4, Field Court, Grays Inn, W.C.

Trinidad Consolidated Oilfields, Ltd.—Capital £400,000., £1. shares. Registered office: 13, Copthall Court, E.C. 2.

British Smelting and Refining Company, Ltd.—Private company. Capital £1,000., £1. shares. Office: 13, Victoria Street, S.W. 1.

Bute Lime Works Company, Ltd.—Private company. Capital £10,000., £1. shares (8,000 preference). Registered office: Mwynwy Villa, Pontyclun, Llantrisant.

Crossland Chemical Refining Company, Ltd.—Private company. Capital £250., 1s. shares. Registered office: 20, Southampton Row, W.C.

H.C.P. Syndicate, Ltd.—Private company. Capital £2,000., £1. shares. Objects: To carry on the business of colliery proprietors, coal merchants, and briquette manufacturers and dealers, etc., and to enter into an agreement with the Associated Chemical and General Industries, Ltd. Registered office: 125, High Holborn, W.C.

H. Pearce, Ltd.—Private company. Capital £6,000., £1. shares. General merchants and factors, merchants' factors, buyers and sellers of oils, greases, metals, etc. Office: County Chambers, Marten Road, Middlesbrough.

Lysle Export and Import Company, Ltd.—Private company. Capital £20,000., £1. shares. Object: To take over the business of exporters, importers, manufacturers of, agents and dealers in perfumes and toilet and other chemical or medicinal preparations carried on by J. de Lysle at 25, Cross Street, Hatton Garden, E.C., as the "Lysle Export and Import Company." Registered office: 9, Gamage Buildings, Holborn, E.C.

Mosses and Mitchell, Ltd.—Private company. Capital £35,000., £1. shares. Object: To take over the business of dealers in vulcanised fibre, etc., carried on at 122-4, Golden Lane and 34-8, Banner Street, E.C., as "Mosses and Mitchell," and to carry on the business of manufacturers of and dealers in "Vulmos" and other vulcanised fibre, Emanden steam jointing, asbestos, insulating materials, etc. Registered office: 122-4, Golden Lane, Barbican, E.C.

T. and T. Lubricants, Ltd.—Private company. Capital £5,000., £1. shares. Registered office: 53, Conduit Street, W. 1.

Intermediates and Explosives, Ltd.—Private company. Capital £50,000., £1. shares. Objects: To carry on the business of manufacturers of and dealers in chemicals, coal and tar products, explosives, etc. The first directors are to be appointed by Bolekow, Vaughan and Co., Ltd. Registered office: 15, Philpot Lane, E.C.

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d.; naked, pure, 2s. 9d. to 3s., naked at works. Carbolic acid, crude, 60%, East and West Coast, nominally 2s. 3d. to 2s. 4d.; crystals, 39-40%, 10d. to 11d., f.o.b. Crude tar, London, 50s. to 55s.; Midlands, 50s.; North, 50s. per ton, ex works. Refined tar, 35s. per barrel. Pitch, 85s.; East Coast, 82s. 6d. to 85s.; f.o.b.; West Coast, 72s. 6d. to 75s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 95-100%, naked, London, 2s. 9d. to 2s. 10d.; North, 2s. 8d. to 2s. 9d. Crude naphtha, naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 8d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: home trade, December, £21., basis 24½%. Nitrate of soda, £22. 10s. to £22. 15s.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of Soda.—There is no change in either the tone of the market or in the price of this material, the quotation on spot for 95/96% quality remaining at £20. 17s. 6d. per ton, net cash, f.o.r., prompt delivery. East Indian Bone Meal.—This market is without alteration, the quotation for January/March shipment being £15. per ton, net cash, ex ship Liverpool for 4½% ammonia and 52% phosphates. On spot, holders ask £16. per ton, net cash, for 4½% and 45% quality. Mineral Phosphates.—There is no change to report in this market, and values at present are only nominal. Dried blood scarce, the value being about 35s. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £104. 15s. to £105., cash; £106. 5s. to £106. 10s., three months; electrolytic, £115. to £118. Tin: Standard, £314. 15s. to £315., cash; £316. 10s. to £316. 15s., three months; Straits, £315. 5s., English, £313. to £314. Lead: Soft foreign, £39. 10s.; English, £40. 10s. Spelter, £51. 10s.; hard, £37. to £39. Antimony, English regulus, 90%, £47 10s. Aluminium, £150. Nickel, £215., ex warehouse. Quicksilver, £24. Bismuth, 12s. 6d. Platinum, 502s. per oz. Wolfram, 32s. 6d. per unit.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplate prices remain firm with plenty of business passing on the basis of 46/6 to 47/- per standard box, f.o.b. Copper firm with better inquiry and slightly dearer at £103. prompt, and £104. three months. Tin, £315. per ton cash, and £316 10s. three months. Lead easier with good movement at £39. 12s. 6d. per ton prompt for Spanish, and £40. 15s. 0d. English. Spelter very active at £52. 10s. prompt. Zinc sheets firm: English £73.; American £68. at New York. Antimony regulus £47. 10s. Aluminium £150. Nickel £208. delivered London or equal. Silver 78½d. per ounce. Sulphate of copper remains quiet, with limited export trade at £41. per ton f.o.b. Sulphate of ammonia steady, with fair sales at £21. per ton prompt delivery. Nitrate of soda, 21s. to 22s. per cwt. in bags, ordinary and refined. Palm oil: Lagos £89. 10s.; softs £88. 10s.; Benin £87. 10s.; and hards £86. Turpentine firm at £6. 16s. 6d. per cwt. Oxalic acid quiet at 1s. 2d. per lb.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

The general demand for heavy chemicals continues satisfactory, both for home and export trade, and values all round have a strong upward tendency. For caustic soda, the home prices are firm at £24. for 76/77% with proportionate allowances for lower strengths. Refined bicarbonate of soda, bags, £8. 10s., and 58% alkali, £6. 10s. per ton. Soda crystals unchanged at £5. 10s. 6d. carriage paid. Bleaching powder softwoods, £17. on rails. Chlorates quiet at 6d. and 1s. for soda and potash respectively. Salts steady at 70s. per ton, bulk, carriage paid. For sulphate of copper there is little or no inquiry and price remains nominal at £41. f.o.b. Commercial hyposulphite of soda, £19. per ton. Phosphate of

soda scarce and dear at £32. per ton. Concentrated sodium sulphide 60/65% casks, £25. 10s. per ton. Nitrate of soda, £21. per ton. White powdered arsenic still in short supply, and quotations firm at £65. per ton for best Cornish brands. Carbonate of potash easy at £105. per ton, basis 85%. Yellow prussiate only moving off slowly at 2/1 per lb. Makers are well sold ahead in prussiate soda and price higher at 1/1½ per lb. Acetic acid and acetate of soda in good request, and prices are firm. English brown acetate of lime higher at £15. 10s. per ton. American grey, £26. per ton. Acetone, steady at £90. per ton. Miscible wood naphtha 10/6 per gall. Lead salts are dearer in sympathy with the metal. White acetate £84.; brown, £67. and nitrate £60. per ton. Nitrite of soda scarce on the spot and price firm at £62. per ton. Green copperas is meeting with rather more inquiry, but stocks are plentiful. Oxalic acid quiet at 1/5 per lb.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

A brisk inquiry for heavier chemicals has again been experienced, a very fair demand on export account having been made. Supplies at works are still very small, and fresh orders are taken subject to this condition, deliveries to be made as it allows. Bleaching powder has met with a moderately active inquiry. For home trade uses £17. per ton is the price, f.o.r. or conveyance, in buyers' packages, and for export £15. to £18. per ton. Chloride of calcium has been but little in demand, and is £8. to £10. per ton, in casks, f.o.r. Caustic soda has been in good request, but has been in very small supply. It is £24. per ton for 76%; £22. per ton for 70-72%, and £21. per ton for 60%. Nitrate of soda has been in moderate demand, and is £21. 10s. to £22. 10s. per ton. Saltcake has been in very fair request, and is £7. 15s. per ton, in casks, f.o.b. Soda crystals have met with a brisk inquiry, and are £5. 10s. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has again been in good request, and has been in limited supply. Prices are £8. 5s. to £10. per ton, according to terms of delivery. Borax continues to meet with a very fair inquiry. Ordinary is £39. per ton, and powdered £40. per ton, in bags, less 3%, for lots of not less than 50 tons. Ammonia alkali has been in good demand, and is £6. 10s. to £6. 15s. per ton, f.o.r. Hyposulphite has been quiet, and is £18. 10s. per ton for ordinary, and £22. per ton for pea crystals, in 1cwt. kegs. Sulphite of sodium continues quiet, and is £11. per ton for ordinary, and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been but little in request, and is £23. per ton, in barrels, and £24. per ton, in drums. Prussiate of soda has been rather more inquired for, and is 1s. 0½d. per lb. Bichromate of soda has sold more readily, and is 10d. per lb. Phosphate of soda has been in fair demand, and is £30. per ton. Chlorate of potash has met with a quietly steady inquiry, and is 1s. to 1s. 1d. per lb. Permanganate has been but little in request, and is 3s. 6d. per lb. Sulphate of potash has been inactive, and is £23. per ton. Carbonate of potash has been in moderately active demand, and is £95. to £100. per ton for 80-85%. Caustic potash has been well inquired for, and is £120 per ton. Nitrate of potash has been in fair demand, and is £60. to £62. per ton for refined, and £40. per ton for ordinary. Canadian potashes have had a slow sale. Montreal first quality are £200. to £220. per ton, and second quality £190. to £210. per ton. Bichromate of potash has been in moderate request, and is 1s. 6d. per lb. Yellow prussiate of potash has been rather more in demand, and is 1s. 10d. to 2s. 1d. per lb. Sal ammoniac has been in quietly steady request, and is £95. per ton for first quality lump; £90. per ton for second quality, and £5. per ton extra for crushed. Sulphate of ammonia has been in moderate inquiry, and is £21. per ton for December; £21. 7s. 6d. for Jan., 1920; £21. 15s. for Feb., and £22. per ton for March to May, 1919. Carbonate of ammonia has been in very fair request, and is 7½d. per lb. Muriate of ammonia has been but little called for, and is £45. to £50. per ton, according to grade. Magnesia has moved rather more freely. Carbonate is £2. 5s. per cwt., and sulphate £11. to £16. per ton, according to grade. Alum has been steadily inquired for, and supplies available for early deliveries have again been very light. Prices are: For home trade uses, £18. 10s. per ton, and for export, £18. 10s. to £19. 10s. per ton. Aluminoferric has been very

quiet, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been in moderate demand, and is £12. to £17. per ton, according to grade. Sulphur has had a fairly active inquiry. English flowers are £32. per ton; roll is £28. per ton, and rock £22. per ton, in bags, f.o.r. In Sicilian, flowers are £28. per ton; roll is £22. 10s. per ton, and rock £17. 15s. per ton. Cream of tartar has been more inquired for, and is £13. to £13. 5s. per cwt. Tartaric acid has been in fair request, and is 3s. 3d. per lb. Boracic acid has been rather more in request, and is £72. per ton for crystals, £74. per ton for powdered, and £2. to £3. more in casks. Oxalic acid has sold a little more freely, and is 1s. 4d. per lb. Citric acid has met with a steady inquiry, and is 4s. 4d. per lb. White acetate of lead has been quiet, and is £84. to £85. per ton. Arsenic has been in moderate demand. White powdered is £65. per ton. Sulphate of copper has been quiet in the home trade branch, but has been more called for on export account. It is £41. per ton for home trade uses, and £41. per ton for export, in casks, less 5%, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.**TUESDAY.**

Business is still very brisk, with a good inquiry for export. For home consumption a considerable volume of business has been transacted for 1920, particularly in caustic soda and bleaching powder.

Prices per ton, net, are nominally: Bleaching powder, softs and hards, £17.; caustic soda, 76-77%, £26.; do., 74-76%, £25.; do., 70%, £24.; do., 60%, £23.; recovered sulphur, 2cwt. bags, £25.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda (saltcake), in bulk, £4. 10s.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £56.

COALS.—There is a very strong market, and a great scarcity of coal for immediate loading. Nominally prices for export are: Best Northumbrian steam, 95s. to 100s. per ton; do., seconds, 90s. to 92s. 6d.; Northumberland small coal,

75s. to 80s.; do., seconds, 70s. to 72s. 6d.; best Durham gas coals, 80s. to 85s.; do., seconds, 75s. to 77s. 6d.; Durham bunker coals, 70s. to 80s.; do., seconds, 65s. to 67s. 6d.; foundry coke, 100s.; gas coke, 95s.

WEST OF SCOTLAND CHEMICALS.**GLASGOW, WEDNESDAY.**

During the past week the demand for the various heavy chemicals has continued fairly steady, and there has been a substantial inquiry as far as the home market is concerned. Prices are keeping to the firm side, and some of the leading chemicals continue to be somewhat scarce. Current prices are as follows: Arsenic, £65. per ton, net, Glasgow; bicarbonate of soda, £10. 10s. and £12. 10s. per ton for 6-8 cwt. casks and 1cwt. kegs, net, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags; and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £27. per ton, net, Glasgow; chlorate of potash, 1s. 2d. per lb., net, Glasgow; chlorate of soda, 8d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 98%, £12. per cwt., net, Glasgow; paraffin wax, U.K. deliveries, 125°, 6½d. to 6¼d.; 121-3°, 5½d. to 5¼d.; 118-20°, 5d.; 110-12°, 4d. to 4½d.; and 98-102°, 4d. to 4½d.; salammoniack, £95. and £90. per ton, net, any port, for first and second lump respectively; salammoniack crystals, £70. per ton, net, Glasgow; saltpetre, £3. 4s. per cwt., net, Glasgow; tartaric acid, 3s. 3d. per lb., 5%, Glasgow.

Among the sea oils the demand is also well maintained, and the most noticeable feature is the upward tendency of practically all the prices. Whale oils, as an example, bear firmer quotations all round, and the latest rates ruling are 98s. for pale (as against 94s. previously); 78s. for brown (as against 76s. previously); and 77s. for black (as against 75s. previously). The demand is good, but deliveries are not always easy of prompt execution. Newfoundland cod is the only sea oil which is at its previously quoted figure—namely, 82s.—but pale seal has advanced from 96s. to 98s., and Menhaden from 80s. to 82s.

In the coal trade conditions are more or less unchanged. Demand continues brisk all round, and the leading industrial works continue to take up big quantities of fuel.

Constantinople, 1 cs. (pt.), £5.
- MERCURY BICHLORIDE**—
Buenos Ayres, 2 cs. (pt.), £7.; Constantinople, 1 cs. (pt.), £15.; Paris, 4 cs., £300.

MERCURY CHLORIDE—

Buenos Ayres, 2 cs. (pt.), £8.;
Paris, 4 cs., £325.

MERCURY OXIDE—

Danzig, 1 cs. (pt.), £16.; Jamaica,
1 cs. (pt.), £21.; Paris, 14 cs. (pt.),
£1,186.

MERCURY PRECIPITATE—

Baku, 1 cs. (pt.), £5.

METHYL SALICYLATE—

Constantinople, 1 cs., £9.;
Smyrna (F.), 11 cs. (pt.), £10.

MINERAL WAX—

Amsterdam, 2 t.

NICKEL SALTS—

Sydney, 1 ck., £15.

NITRIC ACID—

Bombay, 1 c., £11.

OLENIC ACID—

Helsingfors, 1 brl., £20.

OXALIC ACID—

Kobe, 2 cks., £66.; Karachi,
2 kgs., £15.; Melbourne, £53.;
Malmo, 2 cks., £120.; Piraeus,
1 kg., £6.; Sydney, £53.

PARAFFIN WAX—

Antwerp, 10 c.; Barcelona, 5 t.;
Genoa, 6 c.

PEROXIDE—

Gibraltar, 1 cs., £6.

PHOSPHORIC ACID—

Lisbon, 1 cs., £22.

PHOSPHORUS (AMORPHOUS)—

Bombay, 10 cs., £133.

PITCH (STEARINE)—

Cologne, 30 t.

PITCH (VEGETABLE)—

Antwerp, £659.

PLUMBAGO—

Alicante, 1 t. 11 c.; Alexandria,
£387.; Batoum, 7 t. 14 c.

POTASH & TARTARIC ACID—

Bombay, 1 cs., £18.

POTASSIUM ACETATE—

Bombay, 3 cs. (pt.), £56.

POTASSIUM BICARBONATE—

Brussels, 3 cks., £25.

POTASSIUM BICHRIMATE—

Bilbao, 1 c., £5.; Buenos Ayres,
14 pkgs. (pt.), £5.; Danzig,
5 t. 3 c., £820.

POTASSIUM BROMIDE—

Bombay, 1 cs. (pt.), £13.; Cal-
cutta, 1 cs., £25.; Karachi, 1 cs.,
£25.

POTASSIUM CARBONATE—

Sydney, 1 cs., £10.

POTASSIUM CHLORATE—

Bombay, 2 c., £21.; Buenos
Ayres, 1 c., £7.; Colombo, 1 c.,
£8.

POTASSIUM CITRATE—

Bombay, 1 cs. (pt.), £14.; Cal-
cutta, 1 cs. (pt.), £7.; Canton,
1 cs. (pt.), £7.; Melbourne, 1 cs.
(pt.), £7.; Sydney, 1 cs. (pt.),
5 cs., £130.

POTASSIUM CYANIDE—

Bombay, 3 cs., £47.; Buenos
Ayres, 14 pkgs. (pt.), £5.; Cal-
cutta, 3 pkgs., £45.; Colombo,
1 pkg., £26.

POTASSIUM HYDROXIDE—

Buenos Ayres, 3 cs. (pt.), £8.

POTASSIUM IODIDE—

Antwerp, 4 cs., £342.; Baku,
1 cs. (pt.), £20.; Bangkok, 1 cs.,
£50.; Buenos Ayres, 3 cs. (pt.),
£8.; Brussels, 27 cs., £598.;

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers).....	19s. 6d.	24s.
Half-yearly (26 numbers)...	10s. 6d.	13s.
Quarterly (13 numbers).....	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

CURRENT TOPICS.

REVISED CHEMICAL STATISTICS.

IN February last the Board of Trade announced that they proposed at an early date to undertake the revision of the classification of goods entered for import into or export from the United Kingdom, with the object of determining whether the headings under which goods are grouped should be in any way modified for the purpose of increasing their utility to the trading community. The demand for such a revision had been insistent from many quarters for years before the war, the form of the statistics issued monthly by the Board of Trade being not nearly so useful as they could very easily have been. Just when we were thinking that the matter had been shelved came a more definite statement on the subject. The Board of Trade, it appears, has been kept busy for some months consulting with various bodies with reference to the appropriate classification of all the main groups of commodities. A new list has now been prepared embodying the revised classification, but as at the time of writing it is not available it is impossible to say whether or not it fully meets the requirements of the chemical and allied industries. The former separate import and export lists, it is said, have been combined, and the assimilation of import and export headings has been carried much further than before. The number of headings has been increased from 855 to 1,650 for imports and from 606 to 1,360 for exports, and the group relating to chemical products is the one to which the largest additions have been made. In this group the number of headings has been increased from 54 for imports and 42 for exports to 157 for both. In addition to the more detailed classification of commodities adopted, the record of foreign trade by quantity as well as by value is proposed in a considerable number of cases in which quantities have not hitherto been secured. In other cases the units of quantity prescribed have been reconsidered with a view to securing improved informa-

tion on matters the importance of which was thrown into relief during the war. So far as we are in a position to form an opinion on the information available, the proposed revision is in the right direction. That the reform is long overdue so far as the chemical trades are concerned we have already shown in these columns. In 1913, for example, the total value of the British imports of "Chemical Manufactures and Products (other than Drugs, Dyestuffs, and Manures)" amounted to £4,534,536. In the group as a whole, chemicals valued at £2,280,773., or 50.3 per cent., were grouped together as "unenumerated" or "other sorts." In the subgroup of potash compounds the proportion was 72.3 per cent., and in the case of soda compounds as much as 93.2 per cent. Many of the products whose identity has not hitherto been disclosed, at all events in the monthly trade returns, exceed in value those which have always been specially defined. In a lesser degree, a similar state of affairs exists in respect of the export trade. Unfortunately, for reasons given in the official announcement, the revision will not be attempted in the monthly returns for next year, though the information will be made available through the medium of Chambers of Commerce and other bodies.

BRITISH CHEMICAL TRADE WITH INDIA.

WE publish in this issue a continuation of that section of the report of Mr. Thomas M. Ainscough, O.B.E., H.M. Senior Trade Commissioner in India, which deals with the prospects of the British chemical trade in India. Mr. Ainscough's summary of the position and his recommendations are very interesting. The Indian trade in heavy chemicals of all kinds amounts, normally, to £675,000., of which the United Kingdom's share is in the region of £500,000. During the war, owing to an increased demand, but mainly owing to the large advances in prices, the imports advanced to £1,815,000. in 1917-18, of which more than two-thirds came from the United Kingdom and one-fifth from Japan. The share of the United States has also risen to 11 per cent. As regards acids, nitric and sulphuric, ammonia and salts thereof, aluminous sulphates, potassium compounds, disinfectants, etc., the trade is well organised in the hands of import merchants, and the goods are usually sold to them in London. There are few suggestions which can be offered. One British firm is manufacturing sulphuric acid in Bombay, and a further large works for this purpose is shortly to be erected near the iron and steel works at Jamshedpur (Sakchi). The imports from Japan are increasing considerably. In respect of alkalis in general, and soda compounds in particular, the United Kingdom is in a very strong position owing to the activity and excellent representation of the largest firm of British manufacturers of these products, who maintain their own staff and selling organisation throughout the country. A very large business is done in soda ash and soda crystals, caustic soda, etc., for use in dyehouses, paper-mills, glassworks, and also for domestic purposes. Competition is recently being met

with from the crude soda imported from the Magadi Lake in British East Africa, which is worked up in Calcutta by an Indian company. There is a fair trade (70,000cwt. a year) in bleaching materials, which, before the war, was almost entirely in British hands; but shipments from Japan are now four times the value of those from the United Kingdom. British makers of all these products should take steps to secure the services as agents of the few firms in India who specialise in chemicals. Regarding the trade in dyestuffs, the German manufacturers before the war had their own offices and laboratories in Bombay, where they made tests, trained Indian chemists and demonstrators, and from which they controlled their organisation throughout India. Depôts were established in the leading centres, such as Ahmedabad, Madura, Amritsar, and Cawnpore, and the market was effectively worked by European and Indian agents and travellers, who reached every village dyehouse in the country. German inspectors and demonstrators also constantly travelled throughout the field to study conditions, check the statements of their agents, and stimulate them to increased efforts. By this systematic distribution they obtained control not only of the trade with the mills, but also of the bazaar trade, which is by far the larger and more lucrative. The result of their efforts was that, out of a total import in 1913-14 of dyes obtained from coal tar, amounting to £707,000., Germany secured £541,000., and it is probable that of the £83,000. worth imported from Belgium the majority were of German origin. To these figures should be added £55,000. worth a year of synthetic indigo. The only sound and satisfactory method for British makers to adopt is to follow the German system, which, in the case of dyes, is the best system to meet the needs of the market. It is essential that they should open offices and laboratories in Bombay, that they should staff them with commercial men and also with one or two trained chemists, and that they should establish a network of depôts and Indian agencies throughout the market. The dyes should be shipped in bulk, and then made up to the strengths desired, tinned, and labelled on the spot. The larger firms should supervise their own distribution by means of depôts, sub-agents, and travelling European inspectors; but lesser makers may not be able to do this, in which case they should appoint the best firm, British or Indian, available in each district, and follow this up with constant visits by travellers. A head depôt in Bombay is essential in every case.

NEW ZEALAND FOOD AND DRUGS ACT AMENDMENTS.—An Order in Council of September 15, issued under the Sale of Food and Drugs Act, 1908, of New Zealand, provides that cream-of-tartar substitutes shall contain not more than 1 per cent. of sulphates, calculated as calcium sulphate (CaSO_4), not more than one-hundredth of a grain of arsenic, calculated as arsenious oxide, to the pound, and not more than one-seventh of a grain of lead to the pound. Baking-powder shall contain not more than 1.5 per cent. by weight of sulphates, calculated as calcium sulphate; it shall yield not less than 10 per cent. by weight of carbon dioxide on heating with water and it shall not contain any alum or compound of aluminium. Coloured baking-powder shall conform to this standard.

WAR EXPERIENCES IN THE MANUFACTURE OF NITRIC ACID.

BEFORE the Chemical Society, in London, on Thursday (December 18), Professor J. Walker, of Edinburgh University, delivered a lecture, entitled "War Experiences in the Manufacture of Nitric Acid and the Recovery of Nitrous Fumes." This is one of a series of three lectures connected with the war, and the lecture-room was filled to overflowing. Sir James Dobbie, the Government chemist, presided.

Professor Walker said the experiences which he was about to relate were more those of his immediate colleagues, because his own part was largely that of a spectator. At the same time, he realised that these experiences were probably the same as those of others who worked at the same problems in other factories. Not only did all those who were at work have the benefit of the experiences of all others elsewhere, but later they had the benefit of the experience of the Research Department at Woolwich and of the Munitions Inventions Department.

T.N.T.

In the spring of 1915, when the dearth of high explosives had become a matter of public outcry, they at the University of Edinburgh wondered if they could do anything to aid in the manufacture of these explosives. Dr. Alexander Cumming, lecturer in chemistry at the University, suggested that, as there were local supplies of concentrated sulphuric acid, toluene, and sodium nitrate—Leith being the port for receiving nitrate from South America,—the War Office might be approached on the matter. Lord Moulton, acting for the War Department, received the proposal most favourably; indeed, they were extremely grateful to Lord Moulton for his constant encouragement in this enterprise and for his help in many ways when they had little difficulties with various departments. Dr. Cumming supplied the energy and driving force of the concern, Mr. J. W. Romanes, a graduate of the University of Edinburgh, supplied the technical experience which he had gained in other lines from those upon which they were working, whilst his own personal part was that of the benevolent uncle. They undertook to produce 150 tons of T.N.T. before a certain date. They debated for some time whether they should start a factory in the old disused gasworks or in a disused chemical factory which had been used for the extraction of alkaloids and for the preparation of coffee essence, and finally they decided on the latter.

They began work in April, 1915, to reconstruct this factory; by September of the same year they had done their first nitration, and made their first despatch of T.N.T. in October, 1915. The first contract for 150 tons was completed before the date specified. They then secured a further contract, but as the factory was in a very populous district and also could not be greatly extended—at that time they were producing 17 tons per week instead of the five tons which they had originally contracted to do—they were asked if they would undertake the construction and management of a Government factory in the neighbourhood of Edinburgh, on the southern boundaries, and not in a populous district. This was called H.M. Factory, Craighleith, and they undertook to produce 30 tons per week, which was afterwards extended to 50 tons per week. Production was

started in March, 1917, and by the end of July they were making about 30 tons per week. At this point the original factory was stopped from making T.N.T. in view of the fires and explosions which had taken place in other factories in densely populated districts similar to it.

The first factory was then turned over to the manufacture of calcium nitrate by the catalytic oxidation of ammonia, but there were considerable delays in getting it started—delays for which he and his colleagues were not wholly responsible,—and they had only reached the stage of production on the large scale at the date of the armistice; it was only a few weeks before the signing of the armistice that they were able to produce calcium nitrate from nitric acid by catalytic oxidation of ammonia at the rate of 30 tons per week.

This brief account of the work they undertook brought him to the real subject of the lecture. This country was in many ways before the war in a disadvantageous position with regard to the supply of nitrates and nitric acid. All our nitrate had to be brought either from South America or, to a smaller extent, from Norway in the form of calcium nitrate prepared from nitric acid by the arc process.

NITRIC ACID.

Dealing with the experiences at Edinburgh in the manufacture of nitric acid, Professor Walker showed a number of slides of the plant, and in explaining the general working of it—for the elementary nature of which he apologised—said that we could take credit to ourselves in this country that the manufacture of nitric acid had been facilitated so much by the developments in the silicaware industry, which the Thermal Syndicate had taken up. Without these products there would have been much greater difficulties in the manufacture of nitric acid and many other substances. He specially drew attention to the spirals, which withstood the action of hot acid inside and cold water outside. One type of nitrating pot used in the work had a capacity of one ton whilst another had a capacity of $2\frac{1}{4}$ tons.

A number of photographs of the Craighleith plant were then shown, and it was explained that the nitric acid in the process of distillation was obtained partly as strong nitric acid (90 per cent.) and partly as weak (60 to 70 per cent.), and it was possible to charge into one pot or another at will by means of a three-way tap. Earthenware vessels were used for the weak nitric acid. This was the ordinary method for the preparation of nitric acid from nitrates. The sulphuric acid used was about 92 per cent. concentration, because their object was not to get the very strongest nitric acid possible, but to get as large a yield as possible, and they generally collected nitric acid varying from 94 per cent. strength on the one hand to 70 per cent. on the other. The plant was so arranged that they could obtain acid of any weakness or strength according to the purpose in view, depending on how the nitration was being conducted.

In September, 1918, they were collecting 90 per cent. of the acid as 90 per cent. acid, and 10 per cent. as 60 per cent. acid, instead of 70 per cent. as 94 per cent. acid, and 30 per cent. as 70 per cent. acid, because that suited the process of nitration which was being carried out at that time. The loss in the plant amounted to about 5

or 6 per cent. That was mostly in the fume, but there might also have been a slight loss in the fused cake which was run out at the end of the operation, but if necessary it could be reduced to practically nil. The time taken for the distillation of the complete charge of $2\frac{3}{4}$ tons of sulphuric acid and $2\frac{1}{2}$ tons of sodium nitrate was usually 16 hours, but it had been found that on special occasions, such as a holiday, the workpeople managed to get it through in eight hours. (Laughter.)

OXIDATION OF AMMONIA.

Professor Walker then came to the other process for the manufacture of nitric acid, of which, he said, they had had a little, but all too little, experience—viz., the catalytic oxidation of ammonia, which was carried out in the original factory after the production of T.N.T. there was abandoned. The process adopted was to get the nitrogen of the ammonia oxidised to nitric oxide, and thus avoid oxidation to nitrogen as far as possible. The concentration of ammonia in the mixture did not seem to matter very much, so far as the practical carrying out of the reaction was concerned, so long as it remained between 10 and 12 per cent. In that case the reaction went quite well and they got a yield on the small scale, and he had no doubt that they would have obtained the yield on the large scale also, after they had had more experience, of something like 97 per cent. of the ammonia converted into nitric oxide, so that the loss by the first reaction was comparatively slight.

The source of ammonia used was the strong 25 per cent. purified ammonia, which was first treated in steam-heated stills, the ammonia gas was passed through a cooler, then through an iron oxide purifier, as in a gas works, to remove sulphur compounds—though it was doubtful whether that was necessary,—and then was mixed with air, the air being produced by means of a blower and measured by a meter. The amount of ammonia was regulated by the feed of the ammonia liquor to the still. When the ammonia-air mixture had been made it was filtered through a box containing some form of wool—sometimes he used cotton wool and sometimes slag wool,—because if dust was carried forward to the platinum catalysts, the efficiency of the catalyst very soon became impaired.

The catalyst was the large type suggested by the Munitions Inventions Department. It consisted of an aluminium box square in section, the size of the square being one foot. Across this aluminium box was a diaphragm of platinum wire gauze, 80 meshes to the inch, the diameter of the platinum wire of which the gauze was made being four-thousandths of an inch, sometimes single gauge and sometimes two or three, but they had not decided which, on the whole, gave the best results when operations had to be stopped. It was found that this gauze had to be heated, as cold platinum was not a sufficiently active catalyst, and the gauze was heated in one spot by a flame. The leads to and from the box were also of aluminium, as anything that had any connection with iron or lead could not be allowed to come between the catalyst and the filter, iron oxide seeming to have a very detrimental effect upon the catalyst. This catalyst, once it was heated to a red heat, started the catalytic oxidation of the ammonia at the spot where it was heated, and the action gradually spread until the whole gauze became hot and all the ammonia that passed through was catalysed, and practically all of it was oxidised into nitric oxide. The time of the gases passing through one thickness of gauze was about a

thousandth of a second, and that represented the time of oxidation.

Fortunately, platinum when used at high temperatures was not susceptible to poisons in the same way as it was at normal temperature. The substances generally found as impurities in technical ammonia seemed to have very little effect on the catalytic activity of the platinum. Hydrocyanic acid or sulphuretted hydrogen seemed to be oxidised when they were mixed with the supply of air, and on coming to the gauze did not cause any trouble. A good deal of heat was given out in the oxidation, and the temperature of the gauze was from 650° to 700° , the gases which passed away from the converter having a temperature of about 400° .

The next operation was to oxidise and at the same time hydrate this nitric oxide and convert it into nitric acid, and that could only be done at a comparatively low temperature. One of the great difficulties was the cooling of the gases from the converter from 400° to from 20° to 30° . They were first passed through silica S-pipes and cooled by water running over the pipes, and then they were passed through pipes made of a metal which was not attacked by nitric acid, these pipes being completely immersed in water. It was found, however, that that was not quite enough cooling, and they found a difficulty in the further treatment to get the conversion of nitric oxide into nitric acid. A considerable amount of heat was given off by the union of nitric oxide with oxygen, and it was necessary to have extremely efficient cooling, this being effected by means of cooling towers.

The gases were first passed through acid towers and acid was obtained in that way, and finally, after a great deal of the oxides had been converted into nitric acid and there was only a comparatively small percentage left in the gases, they were passed through lime towers fed with milk of lime, which took out the rest of the nitrogen in the form of calcium nitrite and calcium nitrate. Calcium nitrite was not required, so the mixture of nitrate and nitrite which was produced in the final towers was supplied, instead of water, to the acid towers, and the nitric acid then produced acted on the calcium nitrite and liberated fumes which passed through these towers and converted the nitrite into nitrate, and in that way it was possible to get nitrate which was very nearly free from nitrite. Finally, the nitric acid, as free as possible from nitrous acid, was converted by neutralisation by means of milk of lime into calcium nitrate, and this solution of calcium nitrate was concentrated to the requisite extent by evaporation in pans.

All sorts of difficulties had been encountered on the large scale with this catalytic oxidation, and they certainly had not all been overcome when the plant was stopped, but if they could have had another three or four months' working he believed they would have got over all the difficulties. Not only had they chemical and mechanical difficulties, but they had acoustic troubles as well. The plant had the objectionable property that even at a distance of half a mile it produced what might be called a disagreeable whistle, but at close quarters it was a continuous piercing shriek, which came from the catalysts. The factory, as he had explained, was in a populous district, and the North British Railway Company, which had a number of sidings in the district, received numbers of complaints as to the nuisance of their engines continually whistling. At last the inhabitants traced the trouble to the proper source, and one day a mechanic came to the factory and demanded admittance, saying that there was no noise that he had not been able

to put right with a spanner. (Loud laughter.) In spite of that, however, they had to refuse the man admittance, and a day or two afterwards he received a postcard saying, "Why don't you oil the d— thing?" (Further laughter.) They had a difficulty in persuading people that it was not due to want of lubrication, and the trouble had not been stopped when they closed the factory.

RECOVERY OF NITROUS FUMES.

The lecturer then went on to a consideration of the conversion of nitrous fumes into nitric acid in connection with T.N.T. production and also the general question of economy of nitric acid in T.N.T. production. In the operations of the original factory, where there was no recovery of nitrous fumes from waste acid, for every ton of T.N.T. produced 1.27 tons of nitric acid were required. At the Government factory at Craigleith, where they started the recovery of nitrous fumes in December, 1917, the amount required was 1.19 tons, but in June, 1918, it had fallen to 1.05 tons, and in September, 1918, to 0.955 tons. Thus they produced a ton of T.N.T. for less than three-quarters of the amount of acid originally used when there was no recovery.

Describing the slides illustrating the plant, the lecturer said the first nitration yielded mononitrotoluene and waste acid, and this waste acid contained from 5 to 5.5 per cent. of nitric acid. In the original work, when time was more important than money and the production of T.N.T. was the only thing required, the recovery plant which had been set up was never used. The waste acid under the recovery process, however, was pumped up into a tank and allowed to flow into the waste acid tank, where some mononitrotoluene separated, particularly as the acid got colder, and floated on the top and was returned to the process. The waste acid went on to a denitrator, and the nitrous fumes contained in the original waste acid were expelled by means of steam and went to a large recovery plant, air being supplied at the same time, weak acid being obtained. At every one of these stages there was a possibility of loss of nitric acid, and the whole point was to obviate these losses as far as possible. Sodium nitrate was a comparatively expensive substance, and the Government were particularly anxious that the smallest amount possible of sodium nitrate should be used owing to the interference with the sodium nitrate supplies by the submarine campaign.

The first denitrators used—made by the Thermal Syndicate—were excellent, but rather small, and as the position of the denitrators was rather exposed, the first thing that happened was that there was a wild rain followed by a frost, and, the water solidifying, simply split the silica brick to pieces, and they could only patch up one denitrator out of three. Various other types were then tried, and the final one was practically of the same type as a rectifying still. The acid fell from the top on to earthenware plates with small holes in them. A steam jet came into the apparatus at the bottom, and the steam kept the acid from falling through the holes. Thus the acid had to collect on the surface of the plates and it overflowed through large pipes. Therefore, the acid was exposed to the action of steam bubbling through it and was completely denitrated in that way. To begin with, they used air with the steam, but found it quite unnecessary. Perfect nitration could be obtained with steam alone. The gases produced by the denitration went out at the top by a wide tube, and the sulphuric acid which had been denitrated went out below. These denitrators

were built of acid-resisting brick. The gases were delivered into fume-recovery towers, 3ft. in diameter, which were packed with earthenware rings for the proper distribution of the liquid flowing down, the gases passing upwards and the liquid flowing down, and, reacting with air all the time, giving a gradual conversion into nitric acid. These recovery towers were set on a high pedestal in order to make use of the colder air. A model of the air-lift recovery towers was shown and operated. By the operation of the apparatus, the liquid is thoroughly agitated and mixed with air. A continuous lift is maintained from one level to the other with very thorough mechanical agitation.

In dealing with this part of the plant Prof. Walker referred to the necessity for introducing greater flexibility into operations in chemical works in the same manner that the chemist in the laboratory was able to introduce flexibility into his tests. Usually, he said, plant was erected on the assumption that it would always go right, but it did not always do that, and he pointed out a few directions in which an attempt had been made to do that in connection with the work he and his colleagues had carried out. For instance, it was possible for the liquid to be pumped to the next tower or sent back to the same tower, and in this and other ways the plant had been rendered flexible in a manner not usually obtained.

With regard to the yield from the denitrating plant and towers, they were finally recovering over 93 per cent. of the nitrous fumes that were actually charged into the denitrators in solution in the waste acids as nitric acid. The strength of the recovered acid could be varied almost at will, but it could not be got much above 60 per cent. In September, 1918, they were collecting 54 per cent. acid, but at any time with the same towers they could alter the method of working so as to get up to 62 per cent. without difficulty, and according to the strength required for the particular nitration, so could it be altered. The fume recovery could be adjusted to meet the requirements. Of 100 parts of nitrogen supplied to the plant in sodium nitrate, 81.66 per cent. was sent out in the T.N.T., the remaining 18.34 per cent. being the loss. There was also some loss in handling the sodium nitrate, which he put at 0.98 per cent. of the original quantity, as sent into the works. This was caused through the sodium nitrate adhering to the bags in which it was delivered, and there was no washing plant at the works for recovering this. The loss in nitric-acid manufacture was about 5.14 per cent.; the loss in the nitration house, washing, and packing came to nearly 10 per cent., and the loss in denitration to 2 per cent. of the original nitrogen supplied as sodium nitrate.

Prof. Walker said they were extremely gratified to receive, after the works had stopped, a communication from the Ministry of Munitions congratulating them upon their work and also upon the fact that on the monthly returns for October, 1918, the nitric acid consumed per ton of T.N.T. was 0.968 ton, whilst in November, as far as they went, it was 0.955 ton.

ACADEMIC CHEMISTS AND CHEMICAL INDUSTRY.

After paying a tribute to the work of the chief chemist at Craigleith, Mr. Donald Grant, Prof. Walker said this brought him to the moral of the work which had been done. It was that the academic chemist need not fear to go into the chemical industry provided he had a competent knowledge of his subject, common sense, and energy, and was willing to work with people who had the technical experience and would take advice from

engineering experts. If, in addition, the academic chemist had the quality of far-sightedness and a spark of imagination he could enter into industries which even were not of a routine character. He was only, of course, speaking of the manufacturing side of the industry. There was the equally important commercial or business side. At Edinburgh there had been no difficulties on that account, because their supplies and their market were assured; there were no business troubles at all, although some knowledge of business was essential. There again, however, he thought the same qualities which made for success on the manufacturing side would also make for success on the business side.

METHYL ALCOHOL IN THE UNITED STATES.

THE future development of the methyl alcohol industry in the United States will, according to well-informed opinion in the industry, be rapid. According as the chemical industries fulfil the promises they are now giving, increased quantities of wood alcohol will be used.

Before the war an adequate supply could always be imported, but this became impossible later, and home production was thus stimulated. Large quantities of alcohol had been customarily discarded by manufacturers because they had been mixed with other bulky waste, and the work of separation presented difficulties. Within the last few years, however, there has been little grain or fruit available in any part of the world for conversion into ethyl alcohol. Even fruit waste, once an important source, has been largely curtailed; sugar beets and molasses also have been diverted to the food markets, so that the burden of the chemical industries that depend upon alcohol has been shifted to methyl wood alcohol.

Its production and purification are rapidly becoming one of the growing industries in America, and the principal source at present is black strap molasses. Only a few days ago the disposal of these molasses by the sugar mills was a serious item, but it is now largely used everywhere as a raw material for alcohol manufacture.

In other countries there are other raw materials which probably in time will become important sources for obtaining wood alcohol, of which the Nipa palm, found in the Far East, India, Africa, etc., can be used, and millions of gallons of alcohol can be obtained from the agave, from which the Mexicans brew a fiery beer. Considerable alcohol can also be found in the waste of gas works. A liberal source of supply must be found for whatever raw material is used, for one small plant of 100 gallons per day capacity will consume 200 gallons of molasses, or one ton of shelled corn, four tons of potatoes, or eight tons sweet apples per day.

There is, therefore, a great need for a concentrated supply to avoid prohibitive labour and transportation charges if cheap alcohol is to be supplied in quantities to meet the demands. This alcohol has appeared on the market in various new forms, of which may be mentioned solidified alcohol, which is consumed in great quantities for cooking on a small scale in the place of electricity, it being convenient to handle and economical. Another recent development is the use of alcohol for separating and purifying gum turpentine, and it also finds employment in the production of ethylene, a suggested substitute for acetylene; but probably its greatest significance attaches to its admixture with other fuels and for use in internal combustion engines.—*Board of Trade Journal.*

FRACTIONAL DISTILLATION.

AT the last meeting of the Bristol and South Wales Section of the Society of Chemical Industry, a paper was read by Mr. W. R. Bird on "Fractional Distillation in the Laboratory and in Practice." A number of forms of apparatus for laboratory fractionations were described and their efficiency compared. One very general fault was noted which very seriously impaired the utility of any column, giving rise to flooding. This fault consists in a reduction in diameter of the tube which enters the flask, this in some cases being the narrowest portion of the whole column, while it should be the widest. The plain tube filled with glass beads makes quite an efficient column if the beads are supported by a wire instead of constricting the tube for this purpose; the bottom end of the tube is thus kept full size. The wire is bent at the lower end to a small circle, a few beads threaded over it, then suspended by a hook in the side tube so that the wire hangs centrally when the rest of the beads are put in round the wire. An account of the results obtained using this form of column was given. Provided the apparatus (consisting of two concentric glass tubes, with a spiral wire occupying the annular space) is used with careful gas regulation and in a draught-free room, the separation is the most useful hitherto effected by laboratory apparatus.

Vacuum distillation did not, in the opinion of the speaker, have any effect in improved separation, only a general reduction in boiling point—a point to be considered very carefully where waste heat might be employed for distillation. Fractional distillation in the factory is easier than in the laboratory, even a plain still by careful regulation of speed yielding fair results. A plain tube with packing may be used, but whatever type of packing is used it must be uniform in size and supported at intervals to prevent crushing of the lower layers, and sufficient space must be provided for passage of vapour and liquid. In shelf or bubbling tray columns, instead of surface contact only, evaporation is made use of, a method leading to purer products. Columns provided with trays having vapour nozzles and hoods provide a very efficient fractionator. It is a mistake to make trays too shallow, as this leads to contamination by spraying; 1 ft. 6 in. was found to give very excellent results. The depth of seal may be greater than usually considered advisable—up to three inches may be used—and overflow pipes must be large. The retention of a considerable quantity of heavy product in the trays at the end of the distillation, if found to be disadvantageous, should be remedied by providing a trap for each tray. The best results are obtained by adding a dephlegmator to the column, which steadies the working, and, with efficient lagging of the column, allows of much greater speed of working. The apparatus should be thermometrically controlled at the base of the column and the outlet of the dephlegmator, which is, preferably, constructed in sections to permit of fractional condensation with return of the liquid to different trays in the column.

ZINC AND ZINC DUST PRICES.—The price of imported high-grade zinc dust has further advanced to £85. per ton, and the demand continues brisk. Supplies in consumers' hands are still short. Australian electrolytic zinc (99.95% purity) remains at £48. per ton, f.o.b. Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

THE HYDROGENATION OF OILS.

"THE Mechanism of the Hydrogenation of Oils in the Presence of Finely Divided Nickel" was the subject of a paper read before the Liverpool Section of the Society of Chemical Industry, by Mr. R. Thomas, on Friday (December 19). The meeting was held in the Adelphi Hotel, Liverpool, Dr. E. F. Armstrong presiding.

It was hardly necessary, perhaps, at that juncture, Mr. Thomas said, to explain what was meant by fat-hardening. Scientifically, it was the addition of hydrogen to the double bonds of unsaturated glycerides or fatty acids. Technically, it meant the conversion of liquid oils or fatty acids into solid products suitable for soap making. The reaction would only occur in the presence of a catalyst such as platinum, palladium, iron, copper, nickel, etc. On a manufacturing scale the one most commonly employed was nickel. There were two distinct systems of fat-hardening—the "open" system, in which the hydrogen was blown through a mixture of the oil and catalyst, the unabsorbed gas being collected, purified, and used again; and the "closed" system, in which the catalyst and oil mixture were circulated at great speed with the gas under pressure.

Both systems had certain advantages. Thus, in the first, the catalyst was not so easily poisoned; while the second, on account of the more intimate mixing of the reactants, proceeded more rapidly. The reaction was carried out at temperatures of from 150° to 220° C., and therefore, from a manufacturing point of view, the speed was of paramount importance with respect to heat losses, catalyst consumption, loss of gas by leakage, and output.

His object was to show how the speed of the reaction was governed by conditions; to explain what part, to his mind, the catalyst played, and to consider the effect of a few representative foreign gases in the hydrogen on the velocity. The experiments on which his remarks were based were carried out six or seven years ago at Port Sunlight. The start was made with olive oil, and a purification of the oil was effected by the use of caustic soda. This gave a liquid glyceride and 93 per cent. of olein and 7 per cent. of linolin. The catalyst was prepared by the precipitation of nickel sulphate with sodium hydroxide, care being taken to keep it out of contact with the air.

Gaseous impurities in the hydrogen were divided into three classes—those like nitrogen, which had purely a physical action; those like carbon monoxide, which united with one of the participants in the reaction—that was, hydrogen; and those like hydrogen sulphide, which united with the catalyst to form a stable compound under the conditions of the experiment. This classification was based on the experimental evidence produced and deduced mathematically.

Mr. Thomas at this stage proceeded to deal with the mathematical aspect of the subject, using a series of specially prepared charts, giving, in algebraic form, equations of successive changes obtained with different mixtures of oil, gas, and catalyst, under different pressures and temperatures, tracing the variations from point to point, and the relation of one to another. There might, he said, be a direct separation of the olein, and there might be a formation of iso-olein. A condition governing the reaction was the concentration of the catalyst.

Several theories had been formed to explain the action of the nickel. The first function of the catalyst was

absorption, the absorbed occluded gas being in a highly active condition through decomposition into atoms. The velocities at temperatures of 120°, 150°, and 180° C. in experiments carried out, using 1% of Ni, were in the ratio of 1 : 1.7 : 2.6. Practically identical ratios were found on using 0.5% and 0.2% Ni. After allowing for the increased solubility of hydrogen in nickel at 180° C. and the increase in the velocity on this account alone, the real ratio of 180° to 120° was 2.1 to 1. This gave an increase in velocity of only 1.13 times for an increase in temperature of 10° C. A low temperature co-efficient of this order of magnitude was generally associated either with diffusion catalysts or with a photo-chemical reaction. The first possibility was excluded on account of the vigorous shaking of oil and catalyst, and hence there was *prima-facie* evidence in favour of regarding the action as a photo-chemical one, due to heat waves or infra-red radiation.

Professor Lewis, of Liverpool, was the first to suggest that catalysis was a radiation phenomenon, and he and his collaborators had put forward a considerable amount of experimental evidence in favour of that view for homogeneous catalysis. In the remarks on temperature he had extended Lewis's conception to heterogeneous catalysis. The cause of the reactivity of the hydrogen had already been explained, so that he had shown how both the hydrogen and the oil might become active under the influence of the catalyst.

DISCUSSION.

Dr. Armstrong opened the discussion. As they were aware, he said, the subject of fat-hardening had been taken up and practised scientifically, and had been carried out in this country, but with the utmost secrecy. Everyone engaged in the industry had to be mute on the subject, but the work done in England had not been so put out as to show the part of British ingenuity in establishing it. They were fortunate in having a paper by Mr. Thomas showing them some of the very difficult work underlying the technical portion of the subject. In the first place, what Mr. Thomas had told them showed that the chemistry required to study the problem was chemistry of the most high order, requiring mathematical knowledge of no mean degree. It was only by mastering the velocity of the reaction, that they got a clue to the nature of the reaction. Roughly, there were two schools working in the most friendly rivalry. They preferred to differ, and yet to qualify their differences by their lines of investigation and their results. Progress was only made by the free-lance tilting against the theory, however great might be the man who initiated it, and showing that it did not wholly solve the problem. It would only stimulate those who upheld a theory to prove its correctness. In having two theories they were bound to have progress.

Dr. T. P. Hilditch said he had been engaged in dealing with the problem before them for a number of years, and, as a matter of fact, the results he had obtained in conjunction with Dr. Armstrong showed that for some time after the start, the course of the reaction between unsaturated oils and hydrogen followed a straight line, which was not in accordance with the reaction being monomolecular. The results would rather lead them to the position that the reaction was not a retarding one; that the saturation proceeded at a constant rate throughout the reaction. The view that they had of that action was probably not so different from Mr. Thomas's, but they imagined that the catalyst acted not only in virtue of its action with the hydrogen, but also that it entered into a loose state of combination with the unsaturated organic compound itself. He asked how Mr. Thomas's results explained what was known as selective hydrogenation. It was established that all the glycerides were hydrogenated before the olein came to be attacked. Dr. Armstrong had shown that not only oleic acid, but two derivatives were formed in the process.

Mr. Higgins suggested that the subject divided itself into two reactions: First, the action of the catalyst as such and the action of the oleic acid; there was the other half of the question as to the activity of the nickel itself. His explanation had been that the activity of the nickel was due to the

taking up of the hydrogen in the solution, but it had nothing to do with the other half. There were other catalysts that would produce hydrogen—as, for example, nickel oxide. It would be interesting if they could get some knowledge of the solubility of nickel oxides.

Dr. Salway thought that the catalyst used in the hydrogenation of fats might be likened to an incipient detonator which, by combining readily with the hydrogen, released sufficient energy to enable the unsaturated glyceride also to combine with the hydrogen. In this connection he thought that the theory of Erdmann, in which it was stated that nickel suboxide was the true catalyst, deserved consideration. He asked whether Mr. Thomas's experiments supported this theory or otherwise.

Mr. W. French asked whether if the very purest catalyst were taken, absolutely free from electrolyte, reaction would take place; would the electrolyte theory of Dr. Armstrong fit in such a case?

Mr. H. E. Potts thought he remembered that the theory was that the concentration on the surface of the catalyst was equal to the square root of the concentration of the bulk. If it were true that with a mixture of oleic and linolic acid results were got as stated, it seemed to him that the assumption of monomolecular action could not exist.

Dr. Moore thought the nickel entered into a loose combination with the oleic acid and then split off again.

Mr. Thomas, replying, pointed out that the first portion of a logarithmic curve differed but little from a straight line, and that up to a transformation of 20 per cent. it would be difficult to distinguish between the two curves from experimental observations. If he recollected correctly, the curves described by Dr. Hilditch were only straight at the start. His general experience confirmed Dr. Hilditch's observations on the recuperation of the catalyst on replacing gas containing carbon monoxide with pure hydrogen. He found it difficult with regard to selective hydrogenation to see how olein could remain inactive with linolin transformed, and then suddenly start to react when the linolin had all disappeared. It was more natural to expect that the olein would start to transform from the moment any of it was formed from linolin. With regard to the points raised by Mr. Higgins and Dr. Salway concerning oxide and suboxide catalysts respectively, it had been the lecturer's experience that hydrogenation with these catalysts was always accompanied by a reduction to metal through an easily reducible suboxide. With regard to the question whether the reaction would proceed in the absence of an electrolyte, he remarked that dry palladium did not absorb dry hydrogen, and possibly the same was true of spongy platinum, which would explain the results obtained by Mr. French on the lines put forward in the lecture as to the action of the nickel on the hydrogen. He agreed with Mr. Potts, that the dissociation of hydrogen molecules into atoms was not rigidly proved from the relation between the absorption and the pressure, but pointed out that the explanation fitted in well with the observed facts.

ZIRCONIA AND ITS DEVELOPMENT FOR INDUSTRIAL PURPOSES.

THE industrial position in relation to zirconia, the new refractory material, was discussed on Thursday, December 18, in a paper by Mr. H. E. Coley, London (which was read by Mr. Ramsden), at a meeting of the Birmingham Metallurgical Society. Mr. F. C. A. H. Lantsberry, M.Sc., F.I.C., presided.

The author said if one assumed that the earth zirconia had descended from the pedestal of the rare earth lists, that literature was correct, and that it was the almost ideal refractory material, why was it not largely used in the metal industry? The commercial man said the cost was too high; he was not, however, concerned with the statements that zirconia formed carbides and nitrides readily, and indulged in other complex reactions only seen within a chemist's beaker. There had not, as yet, been devised a process with a cost production figure low enough to warrant pure zirconia oxide being used for

refractory bricks. It was obvious that the ZrO_2 must be cheapened either by leaving some of the impurities with it, or adding other materials of an inoffensive character. Showing samples of zirconium material which had been through an operation for the removal of the iron and free silica (and which had a breaking-down point under heat at a temperature of $2,300^\circ C.$) the author said the whole question of the use of zirconia on a large scale and for heavy furnace work depended on the question of cost.

Zirconia was somewhat like a sharp sand, and the problem of plasticity had been largely solved. Zirconia, in common with most other refractories, could be influenced as to its shrinkage by the addition of grog—i.e., preburnt and ground zirconia. The essential point was that the grog should have been fired to the same temperature as that to which the bricks were to be fired. The firing temperature was not governed by the melting point of the material, but by the temperature of employment. The grog firing temperature was determined by the kiln firing temperature, and the kiln firing temperature was determined by the temperature of the furnace in which the zirconia shapes were going to be worked. The ground grog completely united the raw material, and a homogeneous and plain structure results which tended to strength. The gas furnace was suitable for the firing of zirconia brick shapes.

Much had been said, observed the author, about the formation of carbides of zirconia during firing, but there was no evidence that those carbides formed below fusion point. The mistake had probably arisen on account of the curious capacity of zirconia to absorb carbon. Black bricks could be obtained by firing the zirconia bricks in a strongly reducing atmosphere, carbon monoxide being freely available, with the result that carbon, deposited in the zirconia bricks, gave a black colour. That colour might be completely removed by firing in an oxidising atmosphere. The point had been raised: Could the zirconia material from which the various shapes were made be used *in situ*? If the material could be shaped to the furnace requirements on the spot without the manufacture of special shapes, the cost would be materially decreased. The answer was that that could be done, but it must not be expected that the zirconia material was going to set under such conditions without cracks appearing. No material would do it, and zirconia had a shrinkage greater than most. With adequate preparations a workable job could be obtained. A highly finished zirconia-built furnace must be properly designed in sections, made in those sections, baked separately, and accurately fitted together.

The position of zirconia—which the war brought forward and had held back—was to-day as follows: A zirconia material could be produced which, so treated, could be moulded into any suitable shape; the shapes could be baked to present a workmanlike finish and surface; and when so baked the shapes had a melting point of not less than $2,300^\circ C.$, a low coefficient of expansion, a low conductivity, a resistance to slags better than other refractories, the property of being heated and cooled alternatively and rapidly without deterioration, and a capacity to resist very great pressures cold and a greater pressure hot than other refractories.

PROSPECTS OF BRITISH CHEMICAL TRADE IN INDIA.*

(Concluded from page 714.)

DYEING AND TANNING MATERIALS.

THE prospects in India are remarkably promising for British dyestuff producers, and it is gratifying to notice that the leading firms are already making a close and detailed investigation of the market, and are perfecting their distributing organisation. I would emphasise the fact that success can be obtained only by following the German methods. A main dépôt, with laboratories and technical staff and a training organisation, should be opened in Bombay; sub-dépôts should be opened in important markets, such as Madura, Cawnpore, and Amritsar; and the bazaars and native dye houses should be canvassed by trained Indian salesmen and demonstrators under European supervision. The dyestuff should be shipped in bulk, and then made up to the required strengths and tinned in Bombay. All this will entail considerable expense and organising ability, but it is only by these means that the bazaar requirements can adequately be met; and it must always be remembered that whoever controls the bazaar trade holds the Indian market. The National Aniline and Chemical Company of New York already has an office in Bombay, and are offering dyes through Indian agents in all markets, while two or three other American export houses in New York and San Francisco are conducting a growing trade with Indian importers. American competition will be keen and insistent. As regards German competition in the future, much will depend on the fiscal treatment accorded to German goods in future—*i.e.*, whether they are penalised by tariff or not. British manufacturers should lose no time in establishing themselves firmly in the market, so that they may be in a position to meet any competitor.

There is another consideration which should be borne in mind. In order that the nascent dyestuffs industry in the United Kingdom should attain its full development, it is essential that it should obtain all the advantages of large-scale organisation in order to reduce costs of production. The home market is not sufficiently large to enable it to do this, and therefore a large export trade is essential. The two largest neutral markets in the world are China and India, and if only a large share of these countries can be permanently secured, the future of the industry is assured. Even for this reason alone, no time should be lost by our producers in establishing themselves firmly in Eastern markets.

PAINTS AND PAINTERS' MATERIALS.

India provides a large and important market for paints, colours, turpentine, and other materials used in

activities of all kinds in the country. Those British manufacturers not already represented in India either directly or by agents should take early steps to perfect their organisation in order to obtain a share of the trade. The following table shows the statistical position during the war:—

Japanese competition is becoming serious—particularly in white and red lead,—while the United States is supplying increasing quantities of all kinds of paints, but so far has given little attention to ingredients such as turpentine. The growth of the shipments from the Pacific coast is due to the activities of the Paraffin Paint Company, of San Francisco, whose "Pabco" paints are known throughout the East. The ground lost by British suppliers has been principally in red and white lead to Japan. In other types of paint they have held their own. So far as turpentine is concerned, the British product predominates, the only rival being America with £1,553. out of a total of £14,200. In other painters' materials the United Kingdom supplies 88 per cent. of the imports, her principal competitor being the United States with 4 per cent.

Mention should be made of the growing industry in turpentine paints and varnishes in India itself. This is, so far, in its infancy, but the success during recent years of one or two companies in Calcutta under European management is an earnest of what can be done. India produces immense quantities of linseed, which in the form of oil is the chief ingredient of most paints. Turpentine is being produced in increasing quantities, as will be seen from the following table:—

Years.	Imported.	Indian Output.	Total.
	Gallons.	Gallons.	Gallons.
1913-14	193,937	58,803	252,740
1914-15	142,138	78,489	220,627
1915-16	86,700	111,835	198,535
1916-17	80,000	125,663	205,663
1917-18	140,772	136,052	276,824

It has been estimated that the ultimate maximum annual production of Indian resin and turpentine may be placed at 600,000 maunds and 1,600,000 gallons respectively, but, of course, it will be many years before anything approaching these figures will be produced. Indian products include all that is necessary for the vehicles of ordinary paints, while mineral resources and established manufactures provide all the pigments necessary for some few paints and a large proportion of the pigments in other cases. Those pigments which seem unlikely to be made in India are, by reason of their comparatively small consumption, of no great importance, and if the projected new manufactures—particularly that of white lead—come into successful operation, India may become almost independent of imported materials.

SOAP.

Largely owing to the energy and initiative of the two largest soap-producing companies in the United Kingdom, who maintain active sales organisations in India, the soap import trade is almost exclusively in British hands.

The figures given in the table on the following page show the classes of soap imported from different countries.

It will be observed that the only serious competitor is Japan, and that her competition is largely confined to toilet soaps, although during the last year greatly increased quantities of household soaps were imported from Japan. The importation of Japanese floating soaps, in particular, is causing uneasiness among certain

Principal Countries of Consignment.	1913-14.	1914-15.	1915-16.	1916-17.	1917-18.

From Japan, as follows:—* 4,181. † 5,355. ‡ 3,502. § 2,540.

The most serious competitor during the war is found to be soaps manufactured in India. The country possesses many advantages for soap production. There is an abundant and increasing supply of all oils and fats, except the palm oils and tallow. These are to be found in the freshest condition alongside the factory. Certain of these oils—notably cocoanut—lend themselves to simple and rapid manufacture of the cheaper grades of soap, for which there is a great demand. Price of land and taxation are both low. It is doubtful whether labour is as economical as would appear from the low rates of wages paid. There is a great market at the doors of the factories, and consequently many charges incidental to imported soaps are eliminated. On the other hand, there is an absence of the masses of cheap substitutes for tallow which are available for the European manufacturer. Caustic alkalis must be imported. Trained labour is not available, and the manufacturer must be prepared to carry on all the processes up to the manufacture of cases, cartons, etc., as there is no market on the spot for these products.

On the whole, however, the prospects for the large British soapmaker who will erect works in the country and manufacture on a large scale are very promising, and if the Government adheres to the policy of rendering the country independent of outside supplies of munitions of war there should be a demand for glycerine for munitions purposes.

In the "Indian Munitions Board Handbook" will be found a most informative article on "Soap in India," by Sir F. A. Nicholson, of the Madras Government Soap Works, Calicut. The following rough table giving the estimated production of soap in India is taken from this publication:—

Province.	Factories producing.		[Production in tons per annum.		
	Above 600 tons per annum.	Below 600 tons per annum.	Bar Soap including twin tablets.	Toilet Soap.	Other soaps.
			Tons.		
Bengal.....	2	1	14,800	Not stated	Trifling, except
Madras	—	1	240	350 tons	1,800 tons "Dhobi
Bombay	2	16	13,660	Not stated	Soaps" in Burma,
Sing	2	4	12,320	Not stated	which, however,
Punjab	—	1	64	Not stated	are priced at bar
Delhi	—	10	152	350 tons	soap rates and are
United Provinces	—	5	520	6 tons	probably similar.
Central Provinces	—	4	264	Trifling	
Burma.....	5	4	18,700	Not stated	
Total ...	11	46	20,720	706.	

These figures should be regarded as potential rather than actual. The quantity is rather what could be made at once if orders were given and time allowed than the regular output. However, they serve to show the strides which are being made in India in the production of soap and should be carefully studied by British makers. There appears to be little doubt that if they are to retain their commanding position in the trade, they will be forced to manufacture in the country.

Considerable trouble is experienced by British suppliers on account of the constant infringements of trade marks both by Indian and foreign competitors. It is not possible to register marks in India, but if priority of user can be proved an injunction with or without confiscation of the goods can usually be obtained from the courts. Considerable expense and trouble, however, is caused to the plaintiff, and it is frequently not until considerable damage has been done that the infringement is discovered.

FLAMELESS GUNPOWDER.

ONE of the problems which the Direction des Poudres set the French chemists in 1906 was to suppress the flame of gunpowders, notably the B.S.P. and B.G. 5, without impairing the ballistic power of the powder. The former object was soon attained with the aid of vaseline, Delpech reports in the *Comptes Rendus* of September 22 last, but it was only by a study of the firing trials that he became convinced that, when other materials were added to the powder, the powder charge had proportionately to be increased in order to secure the same ballistic effect as with the unmixed powder. The conclusion seems rather obvious that a powder containing a certain amount of a diluent non-explosive matter could not be so powerful as the pure powder; and it is also a little surprising perhaps, that Delpech speaks of the materials as "antithermiques" and of "cold powders." He does not mention any temperature determinations, and one might imagine a suppression of the flame without a material lowering of the explosion temperature. The first material tried was powdered charcoal; the effect was slight or nil. Then vaseline and other heavy petroleum greases were tried; these were successful, and it was found that about 3 per cent. of vaseline had to be used, and that in the 75mm. guns, the charge of B.S.P. had to be increased by 4 per cent. to obtain the same ballistic effect. In the 105mm. guns, and larger guns, the percentage of vaseline had to be raised to 6.5 and the powder charge to be increased by 6 per cent. or 8 per cent.; smaller vaseline percentages had in these cases hardly any effect. Naphthalene and mononitro-naphthalene, used in percentages of 10 and 15, suppressed the flame, but gave red to dense black smoke. Trinitro-xylylene (xylite) answers in the 75mm. guns, not in the larger guns, but 25 per cent. of this material was required in any case. Cellulose, both from cotton and wood, extinguished the flame when present in smaller percentages (from 4 to 10), even in the 155mm. guns; it proved difficult, however, to incorporate the filtered cellulose into the powder. Hydrocellulose, obtained as a fine powder, did not cause this trouble. But vaseline is on the whole considered the most suitable material for suppressing the flame, and it offers the further advantage that it stabilises the powder.—*Engineering*.

ZINC CORPORATION, LTD.—Dividend of 2s. per share on the preference shares.

THE AMERICAN GLASS INDUSTRY.

ALARGELY attended meeting of the Society of Glass Technology was held at the Institute of Chemistry, Russell Square, London, on December 17, under the chairmanship of Mr. B. N. Jenkinson.

The main purpose of the meeting was to hear an account of a visit to American glass manufactories by Dr. W. E. S. Turner and Mr. Connolly, but an interesting little ceremony took place first in the presentation of a silver loving-cup to Mr. W. F. J. Wood, the first president of the society, and a silver tea service to Dr. Turner. In making the presentations, the chairman pointed out how the society had been formed chiefly by Mr. Wood and Dr. Turner, whose work for the glass industry was not only appreciated in this country but in other countries. In regard to Mr. Wood, a cheque for £185. had also been presented to him, but he had placed it in the hands of the Sheffield University, and it had been decided to invest it, and the proceeds would be devoted to the purpose of an annual prize, to be known as the Wood prize, to be awarded to some student in the Glass Department.

A long and interesting report had been prepared by Dr. Turner upon his visit to America, which, however, owing to his state of health, he did not read. We give some details from it below.

Dr. Turner and his confrere visited some seventy factories in America and Canada, scattered over a wide area and engaged in the manufacture of a great diversity of products, including optical glass, table ware, illumination and general domestic glass, insulators, scientific apparatus made both at the furnace and the lamp, electric bulbs, window and plate glass, and bottles of all kinds. The American glass industry has now become diffused over a wide area. As yet, with a single exception, it is confined in Canada to the region of the great lakes—viz., Montreal, Toronto, Hamilton, Thorold, and Wallaceburg. In the United States, however, it has spread gradually into a large number of States. Only two of the New England States—viz., Massachusetts and Rhode Island—have any glass industries, but below these all the States east of the Mississippi River, except Georgia, Alabama, and Kentucky have some representative firm of the industry within their borders, whilst the Mississippi no longer forms an industrial dividing line, for a number of States west of it have important glass industries. Although the earliest glass works had no relation to the fuel-producing States, the development of the industry in America has followed very largely the discovery of natural gas wells.

To some extent, a segregation of the different branches of the industry appears from a study of the various factories. It is quite impossible to draw a hard and fast line, but this much may be said, that a very fine artistic glass is made in New York; most of the optical glass produced during the war has likewise come from this State; lamp-blown and graduated scientific apparatus making is largely concentrated in the southern portion of New Jersey; and the bulk of the window and plate glass is made in Pennsylvania and West Virginia. Illuminating and general domestic glassware is a widespread industry; bottles are made everywhere, and even the Pacific coast is already providing a home for several factories.

Much has already been written in regard to the excellence of the glass sands in America, and in this respect the country enjoys a great advantage over our

own. Besides her own deposits, however, America draws upon the same sources as those from which Great Britain to some extent relies, and shipment of Belgian sand at \$2.80. per ton has already been resumed to glass works in Brooklyn. In the matter of good colour the United States has made much greater progress than we have, or indeed any other country, and the subject of decolourising has been recognised as of prime importance, far more white glass now being made from tanks than green. American manufacturers almost everywhere have also learned not only the value but the absolute necessity of thorough mixing of the batch by mechanical means.

Machinery for the manufacture of glass tubing and rod is fast coming into use, and a good deal of progress has been made in the output of chemical and scientific glassware. The production of chemical glassware is not confined to one district, but is distributed in several works at widely distant places. In Vineland, in the south of New Jersey, there are factories producing all kinds of lamp-blown ware, including syringes, thermometers of special types, complex pieces of apparatus with stop cocks of various designs; there is also a large output of graduated glassware. One method deserving of attention for speeding up the output of certain types of lamp-working articles consists in the use of small sets of wheels on ball bearings between which glass tubes and simple articles can be rotated, either for the purpose of re-heating the ends or of annealing the ends after treatment. These small sets of wheels are provided on every bench and driven from light shaftings by cords which are connected to a pulley on the rotating wheels.

During the war supplies of optical glass were forthcoming from a number of American sources and also from special furnaces set up by the Bureau of Standards at its Pittsburgh station. Practically the whole output of optical glass made in America has been due to the efforts of the chemists and physicists who came from the Bureau of Standards and the Geophysical Laboratory at Washington. Another noteworthy feature of the work is that there has been no secrecy, and we have witnessed what has not taken place in any European country—viz., the publication, fully and freely, of all the details of the work performed. The future of the optical glass industry in America, however, is not quite clear, and at the moment it appears that, with the exception of the Spencer Lens Company's plant, all the other factories will be shut down.

In conclusion, the investigators point out that it may be a surprise to hear that glass manufacturers of America are considered to be just as much rule-of-thumb men as in this country. It appears that there were very few glass works there which, before the war, employed a staff of chemists or even a single chemist. As a result of their efforts during the war, however, the men who went from the Geophysical Laboratory and the Bureau of Standards have been induced in many cases to stay in the industry. Although there is as yet no movement amongst glass manufacturers to form a large research association, such as we now have the good fortune to possess, individual manufacturers are engaging chemists and physicists at a greater rate than is the case here, and in the view of the investigators it behoves our own manufacturers to think well ahead and to endeavour to realise that, as glass making is essentially a process in which chemical and physical changes are fundamentally considered, it is only common sense for some person who understands them to be in charge of them.

PRODUCTION OF PARAFFIN HYDROCARBONS IN BY-PRODUCT COKING.

At a meeting of the Coke Oven Managers' Association (Northern Section), held at Durham, on Saturday last, Mr. A. H. Middleton (Consett), in the course of a paper on the "Construction of Coke Ovens," remarked that during his investigations of a very curious experience at their Langley Park Coke Works (Consett Iron Company) he had collected some information that might be helpful to those who had to consider carbonising problems. The experience referred to was the presence of large quantities of paraffin hydrocarbons in the crude benzole and the rectified products made therefrom. Mr. Middleton discovered the cause to be the unusually low temperature at which some of the products of carbonisation were enabled to escape from the oven owing to a special feature in the construction of the oven and to the fact that the ovens were very fully loaded, so that the space between the top of the coke and the crown of the oven was very small, causing the gas to travel quickly through this empty space. The special feature in the construction of the oven was the exceptionally great distance between the top of the heating flues and the crown of the oven arch, which distance he had kept to a maximum when the ovens were built so as to obtain low top heats, particularly with a view to preventing the splitting up of ammonia. That it should be also responsible for obtaining some of the products of low-temperature carbonisation was an unlooked-for result.

As he could not, after careful investigation, attribute the paraffins to any external cause, he concluded that they must have been formed inside the ovens, and he decided that the best way to put that conclusion to the test was to raise the temperature of the top of the oven so that if low-temperature products were present they would be split up by the radiant heat from the oven roof. The quickest and most effective way to raise the temperature of the top of the oven for that purpose was to reduce the amount of coal charged into the oven. The load was, therefore, reduced by one-third, and the result was most marked. The paraffins immediately began to disappear as the gas from the lightly loaded ovens came under treatment, and by the time that all the ovens had been charged with light loads the paraffin content was reduced from 9 per cent. to 1.5 per cent.

That result was very interesting and satisfactory so far as it went, but they were not prepared to reduce the loads of the ovens in that way, so they set about to find some other solution. Mr. Middleton argued that, as they had got rid of the paraffins by subjecting the gas to a high temperature in the oven roof, the presence of those paraffin bodies when the ovens were heavily charged was due to the fact that some of the gas as it was given off from the coal had escaped from the oven without being subjected to a sufficient temperature to break up all the primary products of distillation, and that the preservation of those low-temperature products was due to the fact that the gas had travelled up the comparatively cool core of coal in the centre of the charge and so escaped splitting up, as the temperature in the roof of the oven was very low when the ovens were fully loaded. He further argued that if the gas could be prevented from travelling up the cool core of coal in the centre of the charge and forced to travel out-over through the hot coke, they could get rid of the paraffins without reducing the loads in the ovens, thus raising the temperature in the

roof of the oven and causing the splitting up in the hot empty space. They had, up to then, been charging with uncrushed small coal. By charging ovens with finely crushed coal instead of with uncrushed small the output of the ovens was reduced to an extent which was not generally realised. The improved coke obtained from the finely crushed coal in many cases, however, justified the large loss of output per oven.

Returning to the travel of the gas in the oven, Mr. Middleton said that if the passage for the gas up the core of coal in the centre of the charge was due to the presence of a certain amount of larger coal with the very fine coal, thus ensuring air spaces through which the gas could travel, he came to the conclusion that, if all the coal was crushed, the air pockets would be filled up and that the cool central passage for the gas might be blocked up. The gas would then be forced to travel out through the hot coke, and the low-temperature products of distillation would be split up and the paraffins consequently disappear from the benzole. All the ovens were, therefore, filled to the top with finely crushed coal, with the result that the paraffins in the benzole again disappeared.

In getting rid of the paraffins in the benzole by putting lighter charges into the ovens, they did not merely alter one condition—namely, the weight of coal put into the ovens,—but as a result of the smaller charge they sent up the temperature of the top of the oven. That was a change they wished to produce, but in bringing it about they altered another condition of carbonisation—*i.e.*, they ceased to carbonise any coal in the top portion of the oven, and it might very well be that the whole of the paraffins in the benzole were derived from the coal that had previously been carbonised in that portion of the oven, for when the oven was well filled the coal in that portion was probably carbonised at a lower temperature than the rest of the coal in the other portion of the oven, as there was no heating flue opposite the top portion. Similarly, there was an alternative explanation for the disappearance of the paraffins in the benzole in the second method that was successfully tried—namely, that their disappearance was not due to an alteration in the passage of the gas in the ovens, but to the fact that in changing from uncrushed small coal to crushed small coal they had not provided another passage for the gas as surmised, but that they had altered another of the conditions—namely, the temperature at which carbonisation took place, because it was a fact that the change from uncrushed small to crushed small resulted in a reduction of the charge carbonised by over 8 per cent., and it was quite possible that they did not reduce the gas for heating the ovens in the same proportion; and thereby raised the temperature of carbonisation, which would in itself account for the disappearance of the paraffins.

One of the most important of the phenomena mentioned earlier was the decreased yield of crude benzole per ton of coal. The yield varied inversely with the weight of the charge put into the oven. That was due to the fact that when the ovens were loaded very heavily the tops of the ovens were considerably colder than when the ovens were loaded less heavily, with the result that they were getting in the one case some low-temperature products and low benzole yields, and in the other case the low-temperature products were decomposed, and high benzole yields resulted. Another important result of the changes in conditions of carbonisation was the effect on the yield of ammonia. It was found that when their benzole yields were lowest, the ammonia yields were highest.

SOCIETY OF CHEMICAL INDUSTRY.

NEWCASTLE SECTION.

AT a meeting of the Newcastle Section of the Society of Chemical Industry last week, Professor P. P. Bedson presiding, a paper was read by Dr. J. H. Paterson on

"THE THEORY OF GAS-PRODUCER REACTIONS, WITH SPECIAL REFERENCE TO THE RATE OF GASIFICATION."

Dr. Paterson said his intention was merely to give an informal dissertation on the question. He commenced by describing the elementary principles of gas producers. For some inexplicable reason, all text-books on the subject invariably assumed that there was a certain series of reactions taking place in a gas producer. He did not at all agree with some of those assumptions. He held, despite the text-books, that the first product of the reaction between the carbon and the air was carbon monoxide alone. Economically speaking, a gas producer burning fuel at high rates—say from 50lb. to 100lb. per square foot of grate area per hour—was preferable to a low duty producer, in that the capital cost of the plant was less and the upkeep and labour cost was considerably reduced. High duty gas producers must of necessity be supplied with fuel of low ash content, and a problem of the immediate future was the economical production of an almost ash-free fuel. "The more I deal with coal," said Dr. Paterson, "the more am I convinced that the question of eliminating or reducing ash should not be dealt with when it reaches the furnaces, but at the colliery. I know of cases where it is costing 9s. to 10s. a ton to get rid of the ash, and under favourable circumstances, where the works are near the river, it is costing about 3s. per ton." Continuing, he said that if the ash could be got rid of at the colliery there would be an enormous saving in the cost of boilers, labour, and time. It could be proved without doubt that efficient washing machinery at the collieries would prove a saving and a benefit to the consumer. He believed the consumer could be educated up to the idea of paying more for coal almost free from ash.

Dr. Paterson created considerable interest by a description of a high-duty producer designed by Colonel J. D. Smith. The producer was intended to supply gas for the propulsion of vehicles having internal-combustion engines. He showed a photograph of a large motor-lorry fitted with the producer which had actually run thousands of miles. The producer, according to the photograph, was a very small, compact piece of machinery, occupying very little space. It was worked on the suction principle, with a high rate of fuel consumption, from 80lb. to 90lb. per square foot per hour. It was entirely automatic in action, and had a flat bar grate of the shaking type which had proved efficient under trial. It worked with an extremely shallow fire bed—sometimes as low as two inches thick,—and the designer claimed that when using bituminous coal the distillation zone entirely disappeared and a nearly tar-free gas was produced. It was obvious that if that producer could produce gas containing less than 7 per cent. of carbon dioxide with a fuel bed of an average of four inches thick, at a very high rate of combustion, there could be no room for the supposition that CO_2 was the first product of combustion followed by a subsequent reduction to carbon monoxide. He was of opinion that the time was not far distant when gas producers of that type would be quite common.

Dr. Paterson briefly replied to questions raised in the discussion. In reply to Mr. F. H. Walker, he said he would rather not say anything regarding the clinker problem, as it was worthy of a paper in itself. Clinker was not uniform in composition even when in the same coal. It depended whether the ash was in the body of the coal or was some extraneous substance. Replying to Mr. J. Duncan, he said that air was preheated in some types—the Mond, for instance. When using producers for furnace heating he did not think there was any object in it. He thought superheating the steam was a wise thing, which he would adopt in building a producer. He did not place much faith in adding lime to increase the ammonia yield. He mentioned that it was useful to remember a blast furnace was one of the most efficient gas producers, although the production of gas was not the primary object. He hoped, when his paper on the subject was completed, to deal very fully with many of the points which had to be dealt with very briefly on that occasion.

ANNUAL MEETING OF THE SOCIETY.

The Chairman announced that the invitation of the Newcastle Section to the Society of Chemical Industry to hold its annual meeting next July in Newcastle had been accepted.

BRITISH DYE INDUSTRY.

AT a meeting of the Ossett (Yorkshire) Chamber of Commerce, on Thursday (December 18), a long discussion was entered upon regarding the dye industry in this country. The discussion arose during the consideration of the provisions of the Imports and Exports Regulation Bill.

Mr. J. Ward proposed that the Chamber should support the Bill in its entirety. Touching on the need of protection for the dye industries, he expressed his conviction that, given the opportunity and if research work were carried out on proper lines, this country would be able in a very few years to produce dyes as well as Germany.

In seconding the resolution, Mr. W. A. Taylor observed that in creating a monopoly in the dye industry Germany had practically looked upon dyes as a by-product, and recouped herself by the valuable chemicals extracted in the process of dye-making.

Mr. B. P. Wilson characterised the Bill as the greatest instrument ever devised for the welfare of the country. It contained adequate safeguards for every contingency, and should be passed in its entirety.

Mr. H. Wade (president) supported the resolution, and in alluding to the importance of fostering the dye industry remarked that of the 400 tons of dyes recently imported from Germany 200 tons consisted of a colour which could be produced in large quantities within a few miles of Ossett.

Eventually a resolution in favour of supporting the Bill was carried by a large majority.

CHANGE OF ADDRESS.—Messrs. Bush, Borch, and Gent, Inc., advise us that on December 29 they are moving to larger premises, at 10, Union Court, Old Broad Street, London, E.C. 2. Their new telephone number will be notified, as soon as available, in their advertisements in the various trade journals.

SULPHATE OF AMMONIA PLANT.

DETAILS OF A RECONSTRUCTION.

MR. JOSEPH POULSON read a paper last week before the members of the Midland Junior Gas Association, at the Council House, Birmingham, on "The Reconstruction of a Sulphate of Ammonia Plant." Mr. Carrington Barber presided.

The sulphate house and store were erected in 1902 and built on pitch-pine piles, this being necessitated by the subsiding nature of the ground. There is a central dividing wall between the plant room and the store, and a cast-iron liquor tank composes the roof at the store end of the house. The saturator and dryer platform were four feet above the floor and on the same level as the store room, to which access was made through an arched opening in the dividing wall. This feature has been retained in the reconstruction of the plant.

The concrete floor of the old plant supporting the stills had fractured through settlement, causing the main still to be out of vertical by five inches. The efficiency of the still was thus impaired. The mother-liquor well had also suffered from the settlement of the ground, with the result that the strain caused fractures of the lead lining of the well. The floor of the sulphate store room had suffered.

As to the erection of the stills, the jointing material used consisted of two parts glazier's putty, one part 'Vulcan' cement, one part red lead, mixed with boiled linseed oil, and in this a soft cotton string was embedded. The liming still consists of cylindrical body, shallow domed top, conical bottom, and inlet and outlet pipes. A six-inch sludge outlet pipe and valve were fitted to the conical bottom and the pipe led into the spent liquor pits at the back of the house. The new heater is 3ft. diameter by 8ft. high, and is of cast iron throughout. It consists of flanged cylindrical body and fitted with flanged cap shaped ends. The waste gases pass around 5in. heavy cast-iron pipes, each end being jointed in sockets cast on a diaphragm plate, which is bolted between the end and body of the heater. The liquor is heated on its passage through the inside of the pipes.

The sulphate store was lead-lined—namely, bottom and sides, the latter to a height of 10 feet, all joints being well lead-burned as laid. The saturator pier was lead covered and the mother-liquor well lined, the latter with 10lb. lead. Around the other sides of the platform wooden rolls were made to a height of 10 inches and the lead sheeting of the floor worked over these. In this manner the floor of the stores and staging constituted a continuous tray, drained by means of the fall given to the floor and the channels into the mother-liquor well, which has a capacity of 150 cubic feet.

The saturator is of the open type, having a well for ejecting, the size being 4ft. 9in. by 3ft. 6in. by 3ft. 4in. deep, exclusive of well. The body is formed from plates $1\frac{1}{4}$ inches thick, with an apron of $1\frac{1}{2}$ inches, and the bottom and well of $1\frac{3}{4}$ inches lead. It is made of refined Pattinsonian process chemical plate lead, with a minimum of seams, special attention being given to the strengthening and webbing where needed to ensure its keeping shape, and all is securely timber-braced. The well is encased in a strongly bolted pitch-pine cradle. The saturator is fitted with double detachable ammonia pipes, detachable acid and steam pipes, detachable steam ejector, man-hole and lid, waste gas outlet and flange. With this type of saturator not only can the salt be ejected, but, being

of the open type, it can be adapted to hand fishing, should the ejector need repairs or renewal. The double ammonia pipes are advantageous both for long life and, being carried along the back and two sides, give that equalised distribution of the ammonia gases so desired. The perforated (leaden) steam pipe has proved useful for dissolving the crystals that form round the ammonia pipes and saturator sides after the plant has been shut down. A steam ejector lifts the mother-liquor from the mother-liquor well into the saturator.

The dryer is steam driven and has lead-lined steel shell, and perforated copper basket of 48in. diameter, 16in. deep, with hinged copper doors fitted in the bottom. Through these the sulphate is discharged into the shoot below. The dryer is suspended on cast-iron standards.

The increased efficiency of the heater and main still has resulted in an economy of steam; they got a waste liquor practically free from ammonia with a pressure of 10lb. on the steam branch to the stills, whereas they previously worked at 16lb. to 18lb. A substantial increase of mother-liquor has given a corresponding increase of sulphate made, and the larger-sized saturator has proved beneficial both for quantity and quality of the sulphate made. A process for making neutral dry sulphate is being proceeded with.

THE MICROSCOPE: ITS DESIGN, CONSTRUCTION, AND APPLICATION.

THE Faraday Society, the Royal Microscopical Society, the Optical Society, and the Photomicrographic Society, in co-operation with the Optical Committee of the British Science Guild, meeting in joint session, will hold a symposium and general discussion on "The Microscope: Its Design, Construction, and Applications," on Wednesday, January 14, 1920. The meeting will be held in the rooms of the Royal Society, Burlington House, London, and it will extend over two sessions—from 4.30 to 6.30, and from 8 to 10 p.m. During the afternoon preceding the meeting—from 2.30 to 4.30—an exhibition will be held in the Library of the Royal Society, which will illustrate recent developments in the science of microscopy and the latest applications of the microscope in all branches of industry.

The purposes of the discussion are: (1) To stimulate the study of and research in microscopical science in the United Kingdom by (a) indicating lines of progress in the mechanical and optical design of the instrument, (b) showing by means of exhibits recent improvements in the microscope and its technique, and (c) the varied uses to which the microscope can be applied as an instrument of research in the sciences, arts, and industries. (2) To encourage the manufacture in this country of the highest class of instrument and of the optical glass required for that purpose.

The meeting will be presided over by Sir Robert Hadfield, Bart., D.Sc., D.Met., F.R.S., president of the Faraday Society, who will deliver an opening address, and Mr. J. E. Barnard, president of the Royal Microscopical Society, will then give a general survey of the subject, and he will be followed by Sir Herbert Jackson, K.B.E., F.R.S. Professor F. C. Cheshire, C.B.E., will then speak on the mechanical design of microscopes, and a paper by Professor A. E. Conrady, on microscopical optics, will be presented.

ITEMS OF INTEREST.

ASBESTOS CORPORATION.—Dividends on preferred of $1\frac{1}{2}$ per cent. for quarter to December 31, as well as bonus of 2 per cent. for 1919 on each class of stock.

DERBYSHIRE LEAD MINES.—A remarkable development has occurred in the dispute at the Mill Close Lead Mine, Darley Dale, Derbyshire, which has been in progress for some months. Both the employers and the men on strike are obdurate, and this week the men have claimed three disused lead mines under the ancient Peak mining laws, which they will proceed to work as soon as the plant can be obtained, thus providing themselves with alternative employment. The strikers have now become mineowners by the simple expedient of staking out their claims in the Klondyke fashion, the old law providing that where a mineowner fails to work his property another claimant may take it over.

PACIFIC ISLANDS' PHOSPHATE RESERVES.—According to a Memorandum laid on the table of the New Zealand House of Representatives by the President of the Board of Agriculture, the reserves of phosphate of the Island of Nauru in the Pacific are sufficient to meet the demands of the world for 200 years at the rate of consumption in recent years. Information obtained from a very valuable source by the Board indicates that it might be reasonably assumed that anything from 80,000,000 to 100,000,000 tons are available, and possibly more. The quality of the phosphate is of the highest grade (85-86 per cent.), and it is claimed that this island contains the largest known quantities of high-grade phosphate in the world.

DYESTUFFS MANUFACTURE IN JAPAN.—H.M. Commercial Secretary at Yokohama states that the Japan Dyestuff Company, which was started by the Japanese Government in 1915, does not appear to have made any great impression in commercial circles. An official of the Department of Agriculture and Commerce, however, states that it is not true that the company has failed to make good. The company, he says, was organised for a special and important object, and does not produce dyestuffs, etc., in the same quantities as an ordinary commercial undertaking. At the same time, it is doing business on the lines on which it undertook to work, and is selling five sulphur, five basic, six acid, two acid mordant, eleven direct dyestuffs, and one other. There are under investigation sixteen other dyestuffs, two of which are in the factory stage, and fourteen in the laboratory.

CENSUS OF PRODUCTION.—Another census of production—the first was in 1908, and was in respect 1907—is to be taken in 1921. A Board of Trade Order states that the census will be taken in the following, among other, trades: Coal and ironstone mines under the Coal Mines Regulation Acts, coke works at collieries, oil shale mines and shale-oil works, iron mines under the Metalliferous Mines Regulations Act, and iron quarries, salt mines, brine pits, and salt works; tin-plate trade, galvanised sheet trade, copper, brass, and tin, zinc, and other metal trades (except the gold and silver refining trade); chemicals, coal-tar products and drug trades, seed crushing trade, fertiliser trade, soap and candle trades. Returns for the census will not be required from persons, companies, or firms who did not employ on the average more than five persons, exclusive of officers of the company or members of the firm, during the calendar year 1920.

GLYCEROL IN FATS.—A highly interesting paper on "The Direct Replacement of Glycerol in Fats by Higher Polyhydric Alcohols" is contributed to the *Biochemical Journal* for November by Prof. A. Lapworth and Mr. L. K. Pearson. The work described is the outcome of an endeavour to convert the large quantities of fatty acids produced during the war in the manufacture of glycerol into an edible foodstuff. These authors found that when oleine or stearine is distilled under reduced pressure with mannitol in the presence of a little sodium ethoxide, almost the whole of the glycerol present in the original fatty compound is expelled, the greatest yield being attained when the proportion of fat to mannitol corresponds with two molecules of the former to three of the latter. The other products of the reaction are chiefly water, a little alcohol, and a substance many properties of which are similar to those of the original fat. The composition of this latter substance corresponds with that of a mixture of the di-oleates (or distearates) of mannitan and isomannide.—*Nature*.

TRANSPORT DIFFICULTIES.—At a meeting of the Huddersfield Chamber of Commerce last Friday, a complaint was read from a local firm regarding its inability to get alkali delivered from Northwich by rail because of the shortage of trucks.

ELECTRIC HEATING OF ACIDS.—The heating of acids requires special precautions. The direct immersion of electric heaters in the acid is precluded owing to the fact that there are no suitable materials that will withstand the action of boiling acid. The special heaters described consist of a spiral of wire enclosed in quartz tubes. For high temperatures the spirals are wound of tungsten, while for lower temperatures nickel or nichrome may be used. The spiral touches the inner surface of the quartz tube. The tube is filled with an inert gas, such as hydrogen. Tubes of 1kw. capacity have an external diameter of 15mm. and a length of 400mm. They may be used for all electric heating purposes, and will stand being suddenly immersed in water or liquefied gas.—*Revue générale de l'Electricité*, through *Tech. Rev.*

NEW DEMURRAGE RATES.—The Advisory Committee on Railway Rates and Demurrage have presented their reports to the Minister of Transport. The report on rates is now being considered by the Minister. With regard to demurrage the Advisory Committee have made certain recommendations to the Minister, which he has accepted. As from January 1, the revised charges for demurrage on ordinary wagons will be 3s. per day for the first two days' detention after the free period and 5s. for each later day. The present charge is 1s. 6d. per day. It is complained that there has been a growing tendency of traders to detain wagons. Between January and June inclusive the demurrage incurred was £31,975. per month, representing a detention of 426,338 wagon days per month, as compared with £23,522. per month between November, 1917, and October, 1918, or 313,624 wagon days per month. The position in 1919 therefore was 36 per cent. worse than in 1918. From September, 1913, to August, 1914, inclusive, demurrage incurred averaged £12,972. per month, representing 172,960 wagon days.

FERTILISERS AND FEEDING STUFFS.—Devon County Council have forwarded to the Board of Agriculture the following suggestions with regard to the Fertilisers and Feeding Stuffs Act, 1906: (a) That Sec. 6 (1) and (2) of the Act should be amended, so that in the event of a seller claiming warranty from a manufacturer or a wholesale merchant, it should be possible, on the production of the written warranty, to proceed against the person who issued that warranty, provided that the seller who pleads the warranty can prove that he never had the article in his possession at any time. Sec. 3 (2) and (3) should also be amended so that notice of sampling and delivery of a part of the sample to the seller shall be held to apply to the person who issued the warranty. (b) That official samplers shall have power, on production of their authority, of taking samples from goods in process of delivery—e.g., in railway trucks or warehouses. (c) Official samplers should have power to spend money in the purchase of samples, whether formal or informal. (d) Where a sample is taken by an official sampler, the ten days' limit should be extended to twenty-eight days.

AMALGAMATION OF JAPANESE CELLULOSE MANUFACTURERS.—H.M. Acting Vice-Consul at Osaka states that for some time past negotiations have been in progress with the object of amalgamating the principal Japanese celluloid companies into one concern, to be called the Dai Nippon Celluloid Company. The amalgamation was finally effected on September 9 with the establishment of the Dai Nippon Celluloid Company, capitalised at yen 12,500,000 (£1,406,250.), under the presidency of the former president of the Sakai Celluloid Company. The firms which are entering the combination are Nippon Celluloid and Artificial Silk Yarn Company, Sakai Celluloid Company, Tokyo Celluloid Company, Mikuni Celluloid Company, Notoya Celluloid Company, Sokawa Celluloid Company, Osaka Seni Kogyo Company, and Toyo Celluloid Company. The object of this amalgamation is to effect a more economical use of the essential raw material, camphor, of which the celluloid factories are now unable to obtain sufficient supplies. The works of the Nippon Celluloid and Artificial Silk Yarn Company, the Sakai Celluloid Company, the Osaka Seni Kogyo Company, and the Tokyo Celluloid Company, will be retained in use, while the factories of the remaining four companies will be disposed of with a view to utilisation in other industries.

CORRESPONDENCE.

* * We do not hold ourselves responsible for the opinions expressed by our correspondents.

Fuel Economy.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Reverting to your correspondence column of December 6, apparently Captain Goodwin resents my criticism of his recent paper on fuel economy, but as the matter is one of great importance for the chemical industry generally, I trust that you will kindly find room in your valuable paper for this my final reply to Captain Goodwin and to Mr. Harvey. To the latter gentleman I wish to convey my thanks for his eminently sensible and valuable letter.

I am indebted to Captain Goodwin for sending me, a few days ago, a copy of his complete paper, but I am sorry to say that reading through this has not altered my views at all, and only confirms my opinion that the abstract in your paper was a very good one, although it did not go into minor details. As regards what Captain Goodwin calls my "misstatements and misconceptions, of so glaring a nature, that it would be waste of paper to reply to them fully," I feel that I can do nothing better than ask your readers to consider with me a few of Captain Goodwin's statements and conceptions, with a view to forming a true opinion of their real value.

He talks about placing a tubular "waste-heat" boiler to work in conjunction with a continuously working vertical retort setting, the flue gases leaving the setting at a temperature of 700° C. (1,300° F.) for the benefit of the "waste-heat" boiler, and leaving this at 300° C. (572° F.). If that is done, what about the recuperator for pre-heating the air for the combustion? This most valuable apparatus, or rather part of the installation, must then be set out of action, which would immediately lower the temperature of the retorts, unless additional fuel is added for running the waste-heat boiler; it then becomes an ordinary boiler. Captain Goodwin leaves us uninformed as to how he would complete this installation.

He also makes the suggestion of placing a tubular or locomotive type boiler behind a coal-dust fired water-tube boiler. He airily allows the products of combustion to leave the water-tube boiler at about 200° C. to 300° C. higher than usual, utilising this heat in the tubular boiler for the generation of low-pressure steam. Now, what is the object of doing this? In order to get the full rated output from the water-tube boiler a certain number of B.T.U.'s must be generated under this particular boiler. If some of the available B.T.U.'s are allowed to escape into the waste-heat boiler the output in steam of the first boiler must drop, or else more B.T.U.'s must be added if this boiler is to maintain its full output and the waste-heat boiler also generate steam. In this case the latter is not trading under its real name; it only assumes the name of "waste-heat" boiler.

A certain number of B.T.U.'s produce only a certain amount of steam, and to generate the steam in two places will certainly not show an increased efficiency worth anything over a water-tube boiler of an up-to-date type, properly operated. I think that Captain Goodwin is very wise not to go too deeply into calculations of relative efficiencies; he says they are outside the scope of his paper! It seems to me that he has lost sight of the primary objects for the benefit of the secondary objects. No doubt his paper would be of great interest as a newspaper article, but for the man who is called upon to design heating plants there are no suggestions of value beyond what is common knowledge.

Captain Goodwin says he has also devised a method for breaking up the hot core of gas—i.e., inside tubes, consisting of spirals placed inside the tubes at intervals of about six feet, the spirals being made with a pitch "decreasing" in the direction of the gas flow (Eng. Pat. 14,165). I take the liberty of reminding him of a conversation we had on this subject early in 1915, if I remember rightly. He then asked me for permission to place some of my twisted propeller tower-filling elements inside some nitric-acid condensing tubes in order to break up the core of the gas: he even offered me a small royalty. I mentioned to him that I had used the same principle in 1911 and 1912 on the Continent for ammonia condensers with great success, and I freely gave him full permission to do as he liked, and also waived the question of royalty.

To revert to the main question—pulverised fuel,—it is a thousand pities that Captain Goodwin did not say a single word about the possible dangers of using pulverised fuel, such as, for instance, Mr. Harvey refers to in his letter, which, when we bear in mind the difference in physical properties, etc., between English and American coals, and the somewhat different climatic conditions of the two countries, practically confirms my views. One is therefore led to conclude that he did not know that there were any such dangers. Such papers do more harm than good, and leave me, and I think others of your readers, wondering why they are written.—Yours, etc.,

HARALD NIELSEN.

Westminster, S.W. 1., Dec. 16, 1919.

What is a Catalyst?

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—When a chemical reaction between two or more bodies is only rendered possible by the "stimulus" of a third body, the third body being apparently unaltered and retaining its activity indefinitely (unless rendered impure), then such a reaction is called a catalytic action and the "stimulant" is called a "catalyst."

It has been proved that dry hydrogen and dry oxygen do not react even in presence of dry spongy platinum, but they do react when traces of moisture are present (*Chem. News*, 6, 22, 1910). This reaction was suggested as due to so-called surface action, but the result of more recent investigation attributes the combination, and others of a similar nature, as due to the presence of an "electrolyte."

It is therefore possible to assume that catalytic reactions take place only in the presence of an electrolyte, and that the stimulus is the E.M.F. set up between the catalyst and one or both of the interacting bodies. It is also quite possible that the "hydrogenating process" would be futile if all traces of moisture or other electrolyte were absent. This is a problem which might not present great difficulties to solve. We might then extend our definition to include an electrolyte—i.e., a catalytic reaction is only rendered possible by the catalyst, except in presence of an electrolyte. The fact that in some catalytic reactions an intermediate product can be isolated does not theoretically appear to affect the above.—Yours, etc.,

"F."

December 19, 1919.

Chemists and Income-tax Abatement.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—May I trespass on your space to call attention to what appeals to me as a very feasible suggestion. The subscriptions for technical periodicals, either directly or indirectly through membership of a society, are surely necessities in the chemical profession, especially from the technical chemist's point of view. Is it not fair to reason, therefore, that some exemption on income-tax should be made on this score? Naturally, I am especially speaking from the point of view of the chemist whose subscriptions for such societies and journals represent no inconsiderable part of his income.—Yours, etc.,

"TECHNICAL CHEMIST."

Thames Haven, Essex, December 20, 1919.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The by-product coke ovens are now working five days a week, and two of the plants which supply local steelworks on ordinary iron are working at full capacity. This is a welcome change from the state of affairs a few weeks ago, and it is mainly attributable to the growing demand from the Continent. It is not doubted that by the middle of January needs may be so large as to justify all the ovens working at full capacity. The local demand also promises to become stronger. Basic iron is being smelted as an experiment at Workington, and if it is successful more furnaces may be put on that brand of iron, in which case a larger proportion of the production of coke would have to be reserved for the steelworks.

BRITISH ASSOCIATION OF CHEMISTS.

"If we don't hang together we shall assuredly all hang separately."
—JOHN HANCOCK, when signing the Declaration of Independence.

Hon. General Secretary: Mr. S. E. PRICE, Bedford House, 8, York Place, London, W. 1.

Hon. Registrar: Dr. FRANCIS W. KAY, The Chemical Department, The University, Liverpool.

Hon. Treasurer: Mr. A. G. C. PATERSON, The Pastures, Spondon, near Derby.

Hon. Editor: Dr. E. H. RODD, 7, Mauldeth Road West, Withington, Manchester.

NOTICES.

ALL correspondence for these pages, articles, and reports of meetings to be sent to the Hon. Editor. Annual subscriptions should be sent to the Hon. Treasurer, and all other correspondence relating to the general business of the B.A.C., including applications for membership, to the Hon. General Secretary.

Annual Subscriptions.

Members are reminded that the subscription for 1919-1920 (one guinea) is now due, and should be forwarded to the Hon. Treasurer.

PROCEEDINGS OF THE ASSOCIATION.

The Council.

The 27th meeting of the Council was held on December 13 at the St. James' Hotel, Derby. Owing to the unavoidable absence of Professor Hinchley through illness, the chair was taken by Mr. W. E. Kay.

Nominations Committee.—A list of 20 candidates recommended by the Nominations Committee for election to full membership under the "A" qualification was read and their election confirmed. The Registrar then brought to the notice of the Council the cases of a number of candidates who, although not strictly eligible for full membership, yet had such exceptional qualifications that it would be against the spirit of the regulations to reject them. After careful consideration of each individual case, the Council recommended seven of these cases to the Nominations Committee for full membership.

Registration.—The draft rules of the Association having now been considered by most of the sections, it is necessary to submit them to a reliable solicitor to have legal opinion on them before proceeding to register the Association as a trade union. Mr. Millington (Liverpool) undertook to institute inquiries for a suitable solicitor to undertake the work of the Association.

Income-tax Rebate.—Mr. Zeally (London) outlined the information he had obtained on the income-tax question. It appears that there will be no difficulty in getting rebate on the subscription to the B.A.C. if the formalities required by the Inland Revenue authorities of Somerset House are complied with. The authorities must have a copy of the regulations and a list of members, and the Association must pay income-tax on the excess of its income over its expenditure. Under these conditions the members can claim a rebate on their subscriptions. With regard to rebate on other necessary expenses of chemists, the position is less clear at present, but it is hoped that it may be possible for a claim to be made for rebate on a definite percentage of income for necessary expenses. The matter is receiving further attention.

Appointments Bureau.—This matter is in the hands of the London Section, and a scheme is to be presented for consideration at the next Council meeting.

Patent Office Library.—It is generally felt that the usefulness of the Patent Office library in London, which contains the best collection of scientific and technical literature in the country, is seriously limited on account of the early closing hours of the library. It was accordingly resolved to support a petition to the Board of Trade urging that the hours of opening be extended to 10 p.m. daily, Saturdays included.

A number of other matters were dealt with, including propaganda work, which is receiving constant attention, and the relation of the B.A.C. to other organisations having similar aims.

The next Council meeting will be held at Derby on Saturday, January 17, 1920, at the St. James' Hotel, at 2.30 p.m.

Leeds and Bradford Section.

Since last Spring this section has passed through a very critical phase of its existence, from which it has emerged with renewed vigour, thanks to the unshakable faith and

steady perseverance of a few members. On March 14 last a general meeting of the Section was held, at which the chairman put before the members an extremely pessimistic picture of the present state and future prospects of the Association. The committee, in a body, tendered their resignations, which were accepted. Thereupon a provisional committee was elected, consisting of Messrs. Wilkinson (chairman), Scafe, Hulse, Remy, Vickers, and Professor Watson. A resolution was then passed: "That the members of this Section desire to have placed before them a statement as to the financial and general position of the B.A.C., and that a general ballot be taken as to whether a general levy should be made in order to carry on the B.A.C."

The sequel to the above unfortunate proceedings is given in a report circulated among the members of the Leeds and Bradford Section by the provisional committee. After careful investigation, including attending Council meetings and the examination of the financial position of the Association, the opinion was formed that, far from being moribund, the B.A.C. was, as far as some Sections were concerned, extremely active. Some Sections were failing to do their share of the work, it is true, and were being carried by the more active Sections, thereby retarding progress to some extent. No doubt was left in the minds of the committee that the Association was doing most important work, and that it would be the greatest possible mistake to allow the Section to lapse.

Following the publication of this report, a general meeting of the section was held in Leeds on November 28, 1919, at which Dr. Hedley (the former treasurer of the B.A.C.) and Dr. Forster spoke. Dr. Hedley, after outlining the history of the Association, asserted that our main object should be Unity, not £. s. d., as so many imagined. We cannot hope to hold our own against big combinations of both Capital and Labour without unity. We must make the B.A.C. a solid body to protect the middle class. The Association is run by the voluntary work of the Council, but every member must take an active part. The Council meets but once a month, and all proposals should come before the Council well thought out, or there would be delay, for the voluntary workers have not too much time. He mentioned that the Guarantee Fund had grown from £500. to £600. in a week. Dr. Forster spoke of the work of the Whitley Councils Sub-committee (Manchester Section), and explained how it had become necessary, to attain our aims with regard to the representation of the brain worker on those Councils, to become registered as a trade union. He also pointed out the necessity for a strong organisation of our own to protect ourselves from the penetration of German chemists, who were already beginning to exploit Italy and Russia. With regard to the Whitley Councils, the B.A.C. alone would probably be powerless, and it was considered desirable that all scientific and technical workers should join together to press their claims to recognition. A conference was held at which thirteen different societies were represented, and, as a result, seven of these banded together to form a federation. Mr. Wilkinson pointed out that, if the Leeds and Bradford Section were to go on, all members must be prepared to work. A motion that the Section be continued was then carried unanimously, the provisional committee resigned, and a new committee of twelve was elected, including Mr. Wilkinson as chairman and Mr. Jennison as secretary. Mr. Hudson, who was elected to the committee, said that he was one of the few members who voted against registration as a trade union, and that he had also expressed his intention to resign. He was strongly averse to the methods employed by trade unionism; but in view of the fact that only by registering in this way could chemists hope to obtain representation on the Whitley Councils, he was prepared to carry on, and await developments before he made a decision. In reply, Dr. Hedley agreed that the majority of chemists were opposed to trade-union methods—such as "direct action" or "curtailment of production,"—but it should be realised that trade unionism affords the only legal means of gaining our ends.

London Section.

A successful meeting of the London Section was held at the General Offices on November 24. Owing to the indisposition of the president, the chair was taken by Dr. P. Haas. In accordance with the convening notice, the opening speakers gave a brief outline of the events at the annual general meeting held in Manchester on November 15.

The Chairman, in his opening words, spoke of the necessity emphasised at the general meeting for strict adherence to the

standard set up for membership of the B.A.C. He announced that in future a reprint of the matter published in the *Chemical Trade Journal and Chemical Engineer* would be sent to every member of the Association. The Chairman afterwards, in speaking of the Whitley Council work, gave a brief outline of the formation of the Federation of Technical, Scientific, and Professional Associations, and of the adherence of the B.A.C. to that body.

Mr. J. B. P. Harrison, dealing with the financial questions, spoke of the satisfactory situation at the end of the last financial year, and called attention to the fact that next year's subscriptions were now due, and should be forwarded to the Hon. Treasurer.

Professor Hinchley, who was unable to be present the whole of the time, spoke of the progress made on the question of registration under the Trade Union Acts and the general progress made by the Association during the past year. He announced that the Leeds and Bradford Section, after a lapse of several months, was in process of re-formation, and that a rally was being held in Leeds the following evening, at which he hoped to speak. He had every hope of new and increasing vitality in this Section.

The remainder of the evening was given up to general discussion. Messrs. Gatehouse and Rowell spoke of the necessity for the attention of the immediate employer being drawn to cases of underpayment of technical staffs, and suggested that a courteous letter from the Association would often have the desired effect. Mr. S. R. Price spoke on the various suggestions put forward with regard to Section meetings, and emphasised the need for occasional meetings confined strictly to members of the Association.

Speaking on the proposal for the distribution of reprints, Mr. Dunk suggested that, in order to economise labour and postage, the reprint should not be sent to members who are already subscribers to the *Chemical Trade Journal and Chemical Engineer*, and that such members should forward their names for reference to the Hon. General Secretary. *

CORRESPONDENCE.

(The Hon. Editor is not responsible for the views of correspondents, which are not necessarily the official views of the B.A.C.)

To the Hon. Editor, *British Association of Chemists*.

Dear Sir,—The question of chemist's agreements was discussed at the annual general meeting. It would be interesting to learn the validity of that most general clause, "That the employee shall not enter the employment of any firm manufacturing similar products for a certain (variable) number of years after the termination of the agreement with his present employer." In some cases this applies only within a radius of a certain number of miles. This is a serious handicap to a young chemist, or even a more experienced one, who wishes to obtain another post. Most advertisers demand of applicants that they "must have had similar experience." or, say, "one experienced in the manufacture of such and such an article essential." This seriously limits the field of experience of a chemist, and necessitates his specialising in his first subject. An all-round chemist, with works, research, and analytical experience, stands little chance of obtaining a post when a life-long devotee of the subject is being considered for the same post, although the former may be a better man. I do not know whether the remedy is within the scope of the B.A.C., but it seems to me to require attention. I hope the £350. minimum will become an established fact, for it is little enough for a married man in these days of high prices.—Yours, etc.,

WELFARE ENTHUSIAST.

[Our correspondent appears to have two distinct grievances in mind: Firstly, that employers always demand previous experience in an employee; and, secondly, having secured him, they bind him down, so far as they can, never again to go into similar work elsewhere. Obviously the employer cannot have it both ways, and young chemists must gain their experience somewhere, for experience is not heaven-born. We should be pleased to have the views of other members on this matter. The question of the legality of the usual form of agreement which a chemist is called upon to sign is at present engaging the attention of the Council.—Ed.]

Leeds and Bradford Section. Secretary: H. Jennison, Esq., Marlborough House, Marlborough Road, Idle, Bradford. A smoking concert will be held at the Midland Hotel, Bradford, on Saturday, January 10, 1920, at 7 p.m. During the evening a discussion will be held on the future policy of the Section.

PARLIAMENTARY NEWS.

Cornish Tin Mines.

In the House of Commons Mr. W. Thorne asked the President of the Board of Trade whether the Non-Ferrous Metals Act gives any power to regulate metal imports in such a way as to prevent the constant degradation of the standard of living of Cornish tin miners and other classes of British non-ferrous metal miners; is he aware that the average wage of the Cornish tin miner is only £8. or £9. per month; and can he state the amount annually of the present production of tin in Cornwall and the total number of men at present employed in the industry, both underground and in and about?

The Parliamentary Secretary to the Board of Trade (Mr. Bridgeman): The Non-Ferrous Metal Industry Act, 1918, does not give any power to regulate metal imports. I understand that the average wage of the Cornish tin miner is approximately as stated in the question. At the present time the production of tin in Cornwall is at the rate of approximately 4,000 tons a year, and the total number of men employed is about 5,000.

Metal Mines.

Mr. W. Thorne asked the President of the Board of Trade whether at various times in the last 100 years in the county of Cardigan over 260 metal mines have been in operation, and how many are working now; in Derbyshire over 194 mines in the production of lead ore, and how many are working now; in Cornwall as many as 259 mines for tin, lead, copper, and zinc, and how many are working now; whether in nine cases out of ten the cessation of the industry is due to the rent and royalty paid to landlords; whether the Non-Ferrous Metals Committee is inquiring into this aspect of the question; whether in their report they will give reasons why the recommendations of the Mining Royalties Commission of 1893 were never adopted; what is the reason for holding the Non-Ferrous Metals Inquiry in secret and excluding the Press; and when may either their report or an interim report with minutes of evidence to date be expected?

Mr. Bridgeman: I understand that the number of mines which have been worked in the last 100 years in Cardigan, Derbyshire, and Cornwall are approximately as stated, and that there are now working four mines in Cardigan, two in Derbyshire, and about fifty in Cornwall. The decline in the industry is due to a variety of causes now under investigation by a Departmental Committee which for some time has been taking evidence on three days of each week. I understand that the Committee decided that in view of the nature of the inquiry it was advisable that its sittings should be private. I am unable to anticipate the contents of their report, or to say when it will be presented, but the committee are proceeding with the inquiry as rapidly as possible.

Industrial Alcohol.

Mr. A. J. Balfour, in reply to Mr. R. McNeill, said: The recommendations of the report of the Interdepartmental Committee have been under consideration by the Department of Scientific and Industrial Research, and I am taking preliminary steps, in consultation with the Director of Fuel Research, to enable the Department to deal with the alcohol question in an effective manner.

Fertilisers.

Mr. Holier asked the Parliamentary Secretary to the Ministry of Munitions whether his Department receives, or has received, any and what difference in price per ton for phosphate rock, pyrites, or sulphate of ammonia, respectively, over the price per ton which his Department paid for it; and, if so, for what work done by his Department has this difference in price been received?

Mr. James Hope: I regret to say that there is no profit on these transactions; the second part of the question does not therefore arise.

Sir Arthur Boscawen, in reply to Sir J. Norton-Griffiths, said: The Fertiliser Prices Order, 1918, ceased to operate on May 31, 1919. Since that date maximum delivered prices of basic slag and sulphate of ammonia for home deliveries have been fixed by agreement between manufacturers and the Board of Agriculture. No maximum prices have been arranged for superphosphate on account of the varying cost of importing phosphate rock. Apart from these arrangements the production, distribution, and prices for home consumption

of these fertilisers are now free from control. Control of export of fertilisers is still maintained in order to secure sufficient supplies to meet home requirements. Export licences for any surplus are, however, freely granted. This control will be discontinued as soon as practicable, consistent with meeting the needs of British agriculture.

Matches.

Mr. J. Davison asked the President of the Board of Trade whether any restrictions on the import of matches into this country are still in force?

Sir A. Geddes: No, sir.

Cement.

Mr. Bridgeman, replying to Mr. J. Davison, said: I understand that prohibitions on the export of cement are in force both in Germany and Denmark. According to my information there are ample supplies of cement available in this country, and there should be no necessity to import it.

LEGAL INTELLIGENCE.

Sulphate of Copper Cargo and Ship's Plates.

Judgment was delivered by Mr. Justice Hill in the Admiralty Court in an action brought by the owners of a chemical cargo on the steamship *Yorkshire*, sailing out of Liverpool, against the owners of the vessel, in which the chemical action was discussed of a cargo of sulphate of copper on the keel plates of the vessel.

His Lordship said this was a claim against the owners of the steamship *Yorkshire*, under bills of lading of sulphate of copper and other goods shipped for a voyage from Liverpool to St. Malmo in October, 1917, for loss of or damage to the goods. A great part of the shipment was either not delivered at all or delivered damaged after the voyage had been broken up at Falmouth. The defence was perils of the sea. The plaintiffs' answer to that was unseaworthiness of the ship. Minor defences pleaded were not open to defendants in that court and would only become material if "perils of the sea" failed. The damage was caused by incursion of sea water into the hold during the voyage. The case turned on whether the ship was unseaworthy, and the onus of establishing that was upon the plaintiffs. Unseaworthiness was alleged in two respects—one allegation went to the whole of the damage, the other to part, and it might be the greater part of the damage. First, plaintiffs said that at the beginning of the voyage a lead pipe conducted through the hold to an opening in the ship's side was defective, and also that the storm valve to the opening in the ship's side was defective. By reason of these defects they said sea water entered the hold and, dissolving the sulphate of copper, produced an acid and highly corrosive solution which damaged more of the sulphate and other cargo. In the second place they said that some of the bottom plates of the ship were before the voyage thin and corroded, whereby the acid ate right through them and caused most serious leaks in two plates, which resulted in the hold being flooded and further damage being done, nearly the whole of the sulphate of copper being dissolved and other cargo being seriously damaged or destroyed. Defendants replied, first, that the pipe was sound and was cracked by sea perils during the voyage, and that the valve, though not absolutely watertight, was reasonably fit for its purpose, and, in the second place, that the bottom plates were sound and that the corrosion was entirely due to the acid and wholly caused during the voyage.

His Lordship, after a lengthy review of the evidence, said that the defence of perils of the sea succeeded and there must be judgment for the defendants with costs.

Chemical Merchant's Failure.

At the London Bankruptcy Court on Friday of last week, before Mr. Registrar Francke, the public examination was appointed to be held of George Edward Ellis Newton, chemical merchant, 203, St. James' Road, Croydon, and 74, Gt. Tower Street, E.C.1, who alleged his failure to have been caused through loss of business through shipping restrictions, the Government control of chemicals, and stagnation in trade following the Armistice. The Receiving Order was made against the debtor on October 29 last.

He commenced business as G. E. Newton and Co. in November, 1916, with a borrowed capital of £50. For the first 18 months the business was very successful, and yielded a net profit of £3,000, but in the middle of 1918, owing to the increasing restrictions on exports and the Government control over chemicals, his business fell away considerably, and on the signing of the Armistice had practically ceased. He returned his liabilities at £2,000, and the assets consisted of 10 tons of arsenic powder and 313 tons of a special vacuum salt held by creditors.

The Official Receiver said the debtor had not yet completed his statement of affairs, and he was not in attendance that day. He had attended for his preliminary examination, and although several letters had been sent to him he had never replied. The letters had, however, not been returned through the Post Office, therefore he presumed that debtor must have received them. He asked that the debtor be ordered to complete his statement of affairs within three weeks, and the examination was adjourned until February 13.

Acetic Acid Contract Dispute.

Lord Justice Bankes, sitting as an additional judge of the King's Bench Division last week, heard the case of *Reeve v. Hambrook*, an action by the plaintiff, a vinegar manufacturer, to recover damages against the defendant, a manufacturer of acetic acid, for the alleged breach of contract by the defendant in failing to supply in October and November, 1917, certain quantities of the acid, thereby preventing the plaintiff from making vinegar with it and thereby losing the profit thereon which he otherwise would have made. Plaintiff also claimed damages upon the ground that in consequence of not being able to make the vinegar he had lost customers.

The defence was a denial of liability.

It appeared that the difficulties arose through the Government, in October, 1917, taking control of the acid. Plaintiff, however, obtained permits from the Government Department for supplies of a certain quantity of the acid, and defendant made certain deliveries of the acid under them, and the main question in the case was whether or not the deliveries of the acid made by the defendant to the plaintiff on October 13 and 17, 1917, ought to be accounted as part of the contract quantity.

After hearing evidence Lord Justice Bankes held that under the contract there was a balance of about 2cwt. of the acid due to the plaintiff, and he awarded him £23. 3s. damages.

Judgment was entered accordingly.

THIRTY YEARS AGO.

From the "Chemical Trade Journal" of December 28, 1889.

Railway Rates.—The Railway Rates Inquiry is still dragging on its weary existence before the Board of Trade, and anyone with half an eye can see that without the traders make a desperate effort the companies and the lawyers will have the oysters, while the traders will be left with the shells. As we have said before in these columns, the whole question as far as the traders are concerned, hangs on the classification, and if they had combined to produce a natural classification of merchandise (which might easily have been done), the present difficulties would not have arisen. A very simple instance may be given to show how high railway charges will strangle and divert the course of trade, ruin manufacturers, and produce all manner of evil. We refer to the carriage of ammoniacal liquor, the waste water of the gas works. Three or four years ago we knew of several instances where, through being remote from the manufacturer, gas water was yielding to the producer of it but five shillings per thousand gallons, or about one shilling per ton. The railway charges on a ton of this liquor amounted to *seven and sixpence per ton*, or seven and a half times that which the producer of it was receiving. This led to the producers working it up on their own premises, which, of course, was the most sensible thing to do under the circumstances. Gas water is, we think, one of the most easily carried substances a railway company has to handle. The purchaser finds his own tank wagons, and keeps them in repair, so that the company's work is mere haulage, yet, in spite of this, in the new classification proposed by the railway companies, ammoniacal water has been placed in class —. There is no doubt its place is in Class A; will it find its way there?

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—There is no official confirmation of the enhancement of the selling price in Chili by the Producers' Association to 11s. per quintal f.o.b., the latest version being, in fact, that this body is out of the market for the present "for fear of congestion at the shipping ports." The reason seems somewhat far-fetched, considering that tonnage is so scarce that, as already stated in these columns, there is little chance of exporting this season—January to March, 1920—all the nitrate sold for such delivery. For forward positions freights have come down, 120s. to 150s. per ton being quoted for steamers to load in the second half of next year; but they are still extremely high for early boats, 207s. 6d. having just been paid to the United Kingdom. The average rate before the war was about 25s. per ton, and British steamers carried a large share of the "season" nitrate, whereas they are now shut out of the trade by a benevolent Government, foreign owners getting the benefit of the fancy rates offered by shippers. When the Chilean fertiliser itself is also much dearer on the spot, its cost "delivered in Europe" may readily be imagined, as also the reluctance of the British farmer and the country dealers to make forward purchases; they will wait till next spring to see if prices come down, and if not they will buy nitrate of lime for top-dressing backward crops. For ordinary purposes, sulphate of ammonia is more effective and cheaper. Nitrate of soda is said to be in good demand on the Continent, but the depreciation of the French, Belgian, and Italian currencies has pushed prices up to a positively fantastic level, and it remains to be seen whether the actual consumers will pay these when the time comes for use. In spite of the renewed valiant attempts to hearten holders of nitrate shares, the outlook for the industry is by no means clear.

Continental Phosphate Position.—In a review of the position of phosphates after the war, a French journal says that whilst the demand for phosphate tends to rise very considerably in Europe, the supply on the other hand continues very reduced. The importation of phosphates into Europe, which came before the war to the extent of two-fifths from the United States and the Pacific Islands, is now seriously handicapped by the heavy freights. North African phosphates, therefore, appear to be the only ones available for the supply of Europe. That is to say, that the producers have an almost unlimited market. There is every reason for expecting a great increase in the production of the North African mines, so that the phosphate interests in that region must become of increasing value.

The Reconstructed German Potash Syndicate.—The new association agreement of the German Potash Syndicate was made on October 10, accepted by the Government on October 21, and signed by State Secretary Richter on December 6. After the elimination of the Alsace works, and the adhesion of the previously so-called Sonderwerke, the Association now numbers 139 members (which is not identical with the number of shafts and factories). The previous separate works that are now in the Association are the Mercksche Guanowerke, Hamburg; the Stassfurter Chemische Fabrik-Vorster and Grünberg; the United Leopoldshall Concordia Chem. Fabrik, Leopoldshall Chem. Fabrik, Friedrichshütte, in Leopoldshall; Reit and Co., Stassfurt; Chemische Fabrik, Harburg-Stassfurt, Thörl and Heidtmann, Schachnow and Wolff, Leopoldshall.

Sulphate of Ammonia.—There is very little sulphate of ammonia available for export, and the values mentioned are showing a very wide range, being on one side as low as £28. and on the other as high as £35. per ton, net cash, f.o.b., British ports, in double bags. The prices fixed for home agriculture are £21. for the current month, £21. 7s. 6d. for January, £21. 15s. for February, and £22. for March delivery next year, net cash, delivered destination required by buyers in Great Britain. The present position of sulphate of ammonia here is that it is going into use almost as quickly as it can be produced. The amount for export is small, and the export trade generally inclined to diminish.

Basic Slag.—This material is having a good sale both at Hull and in Staffordshire. Orders from farmers, it is reported, will suffice to keep manufacturers busy for the first three months of the New Year. A further increase in the output is being urgently asked for.

Potash.—So far as potash is concerned, the market here is still very short of stocks, and in view of Continental buying

a further increase in prices would not be surprising. German potash producers apparently desire an understanding with the Alsatian producers and, it is declared, have made proposals to that effect through the most unexpected channels.

Bone Meals.—Stocks of bone meal on hand continue to be small, and again there is no immediate prospect of any substantial increase. Demand, however, at present is not great. Representative quotations are: Pure steamed 1 per cent. and 60 per cent. bone meal, in bags, £13. 10s. to £14.; and pure dissolved bones, 3 per cent. ammonia and 32 per cent. phosphate, £15. to £15. 10s., both ex works.

Meat Meal, Blood, and Tankage.—The market for meat meal is very firm, but again only small stocks are available. The nominal value is now given as 35s. per unit of ammonia. In tankage and dried blood also there is a shortage of available stocks, and prices as the year ends are firming up.

Other Fertilisers.—In the odds and ends of the manure market, castor bean cake unfit for food has been mentioned as likely to find a useful outlet as a fertiliser. The price, however, would apparently have to be much lower than the present figure of £18. per ton.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

The pressure in the tinplate trade continues, and it is gratifying to record that the outputs have slightly increased. Shipments are getting easier, and there is much less talk among manufacturers of American competition. The Far Eastern markets are being closely watched by the home makers, and so far they have been able to supply these without much trouble. Early next year more mills will be restarted.

Shipments in the patent fuel trade are practically normal. The Italians are taking large quantities of briquettes. Some large cargoes have left Swansea during the week, including one of 6,000 tons to Venice, 5,319 tons to Marseilles, 3,000 tons to Rouen, besides small cargoes to La Pallice, Havre, St. Brieux, and La Rochelle.

The coke ovens are working well, and the foreign demand for coke remains good, many cargoes having left Newport and Cardiff for Rouen, Oporto, and St. Malo. It is expected that during the early weeks of the New Year some 200 or more new coke ovens and by-product plants will be started. The output of sulphate of ammonia remains very good, and there is scarcely any difficulty in getting rid of it, so great is the home demand, and little or none is available for export.

The spelter trade is very active, and as there is now a good call for galvanised sheets the metal is required for this purpose locally in much greater quantities than at any time during the last six years. A direct consignment of Australian concentrates has reached Swansea, and 2,500 tons of zinc ore came in on Monday from Port Pirie.

The Swansea Technical College has obtained the status of a university, a charter having been granted to it, and it thus becomes a constituent college of the University of Wales. Local manufacturers who have interested themselves in the matter are to be congratulated upon the attainment of their efforts.

NEW COMPANIES.

Anglo-Eastern Oil and Mining Syndicate, Ltd.—Capital £3,000., in 2,500 ordinary shares of £1. each and 10,000 deferred shares of 1s. each. Registered office: 62, London Wall, E.C.

Colonial Oilfields, Ltd.—Capital £50,000., £1. shares. Registered office: 11, Queen Victoria Street, E.C.

West Hensbarrow China Clay, Ltd.—Private company. Capital £22,000., £1. shares. Registered office: 7, Birchin Lane, E.C.

Callose Tin Mines Alluvials, Ltd.—Capital £185,000., in 5s. shares. Objects: To acquire an interest in certain tin mining properties in Cornwall, and to enter into an agreement with the General Exploration and Finance Syndicate, Ltd. Registered office: Boston House, 63-4, New Broad Street, E.C.

National Dyes, Ltd.—Capital £350,000., in £1. shares (100,000 preference). Object: To carry on the business of manufacturers of dyes and intermediate and refined products, chemists, manufacturers of coal tar, oils, paints, pigments and varnishes, etc. Solicitors: Birkbeck, Yeo and Company, 20, Coptall Avenue, E.C.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

(Concluded from page 684.)

REPORTS OF COMPANIES.

Sapon Soaps, Ltd.

The secondary ordinary general meeting was held last week in London at Cannon Street Hotel, E.C., the Right Hon. the Earl of Denbigh, C.V.O. (chairman of the company), presiding.

The Chairman said: I think you will agree that the second year's trading, under the circumstances, is quite satisfactory, and the dividends which your directors recommend will, I hope, meet with your approval. The gross profit amounts to the sum of £26,614., which, I hope you will agree, is an excellent return on the amount of what I may describe as the productive part of our capital—equal to over 60 per cent. The at present non-productive portion will, I am confident, become remunerative as we proceed, and all new capital now introduced will be equally productive, and should show an even higher rate of earning power. During our second year we have added very considerably to our plant, and are now about to place on the market an entirely new form of our product, which we believe will find a ready sale amongst textile mills and laundries, as it contains in a remarkable degree the maximum of cleansing power and, at the same time, the maximum of lathering properties. After the Armistice orders from the Government rapidly ceased, due to the large stocks of soap they held. I am glad that the home demand has, since the Armistice, rapidly grown. As we can and are producing a soap of greater value in cleansing properties at a lower price—the saving in valuable fats and oils alone being over 50 per cent. and over 75 per cent. in the consumption of coal per ton of soap produced—it must inevitably follow that the waste and extravagance in the use of fats, oils, and coal in soap-making by the old and world-wide method will be greatly lessened as time goes on, and the advantages to be gained by the general use of "Sapon" soaps recognised. The raw material used by us has been more abundant during the year than during the previous year, but prices have enormously increased—oils and fats well over 100 per cent. This increase of that material has not affected us in anything like the same ratio that it has done the ordinary soap-maker, but he has the means of compensating this increase in cost by the addition of water to his boiled soap, with the result, however, that the value of his soap is greatly reduced as a cleansing agent.

At an extraordinary general meeting subsequently held a resolution was passed increasing the capital of the company to £300,000.; and a further resolution was approved offering new ordinary shares to the members in proportion of five such new shares for every two of the preference shares held by them respectively, and one such new share for every two of the existing ordinary shares held by them respectively.

British Cotton and Wool Dyers' Association, Ltd.

An extraordinary general meeting was held at Manchester on Friday of last week, Mr. Adolph Hoegger (the chairman) presiding. The requisite alteration of the articles of association was duly confirmed providing for the capitalisation of reserves, distribution of additional shares in accordance with the scheme outlined at the gathering on December 3, under which the Association's nominal share capital was raised from half a million sterling, in 5s. shares, to one million sterling of the same denomination. It was now resolved that £193,541., part of the Association's undivided profits at the credit of the reserve fund, be capitalised, and that a bonus in the shape of approximately one new ordinary share to every two ordinary shares now held to be distributed, the balance of the new capital powers remaining unissued for future requirements or developments.

Egyptian Salt and Soda Company, Ltd.

The net profits for the year ended August 31 were £(E)219,819, after providing for debenture interest, and £(E)141,847. was brought forward. A dividend of 45 per cent. (9s. per share) is proposed, adding £(E)19,304. to the depreciation fund, and carrying forward £(E)123,957. The net profits for 1917-18 were £(E)391,104., and the distribution was 60 per cent., £(E)29,520. being set aside.

DIVIDENDS.

AMERICAN CYANAMID COMPANY.—Dividend of 3 per cent. (£3. per share) on preferred stock in respect of six months to December 31.

LAURARO NITRATE COMPANY, LTD.—No interim dividend will be paid.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions. Orders, and Official and Other Notices.

Grays Chemical Works, Ltd., London, E.C.—Resolved December 8: That the company be wound up. A. N. Harper, 8, Queen Street, E.C., A.C.A., liquidator. Meeting of creditors, Institute of Chartered Accountants, Moorgate Place, E.C., December 29, at 2.30 p.m. Claims to liquidator by January 15.

Ildokani Oil Syndicate, Ltd.—Resolved November 19, confirmed December 5: That the company be wound up. F. F. Fuller, liquidator. Meeting of creditors, 638, Salisbury House, E.C., December 22.

Kemball, Bishop and Co., Ltd.—Resolved November 25, confirmed December 10: That the company be wound up. Lieut.-Col. A. C. Bishop, 61, Rutland Gate, S.W.; and J. E. Whitehall, Crown Chemical Works, Three Mill Lane, Bromley-by-Bow, liquidators, who are authorised to consent to the registration of a new company to be named Kemball, Bishop and Co., Ltd. Meeting of creditors, Crown Chemical Works, Three Mill Lane, Bromley, E., December 29, at 11.30 a.m.

North Brazilian Sugar Factories, Ltd., London, E.C.—Resolved November 13, confirmed December 1: That the company be wound up.

Trinidad Oilfields, Ltd.—Resolved November 25, confirmed December 10: That this company be wound up. R. G. Longcroft, 2, Broad Street Place, E.C., C.A., liquidator. Meeting of creditors at liquidator's, December 31, at 10 a.m. Claims to liquidator by December 31.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Victory Boot Polish Company (Sidney Clarkson and Raymond Bellamy), Victory Works, Old Foundry Wharf, High Street, Rochester, manufacturers of boot and other polishes. December 2. Debts by S. Clarkson. (December 9.)

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Germany.

A firm in Frankfurt-on-Main desire to represent United Kingdom firms for the sale of chemical products and drugs of every kind, fats and oils, ore and metals. (Reference No. 1260.)

A German inquirer in Cologne desires to secure the agency of United Kingdom manufacturers or exporters of soap. (Reference No. 1261.)

Morocco.

A firm of commission agents established at Fez desire to represent, in Morocco, British firms exporting chemicals. (Reference No. 1271.)

A firm of wholesale manufacturers of boot polishes in Casablanca desire to be placed in touch with United Kingdom manufacturers of ceresine, ozokerit and carnauba wax, turpentine and turpentine substitute or white spirit. (Reference No. 1270.)

BOOKS RECEIVED.

"Small Dwellings." Booklet containing points of interest regarding their lighting. Quite a useful guide to firms contemplating the erection of workmen's cottages. W. T. Henley's Telegraph Works Company, Ltd., Blomfield Street, London, E.C. 2.

Bradford Chamber of Commerce Year Book. Officially issued in the interests of the trade and commerce of Bradford and district, with classified trade index in English, Russian, and Spanish. Contains a mass of attractively displayed and well-compiled matter. Bemrose Publicity Company, Ltd.

Annual Report (1918) Metropolitan Borough of Poplar. By Fredk. Wm. Alexander, Medical Officer of Health. Leading feature being statistics of the very efficient Electrolytic Disinfecting Fluid produced by this municipality.

THE PATENT LIST.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Concentrating Ores. E. C. R. Marks, London. (A communication from Luckenbach Processes Incorporated, San Francisco, U.S.A.) British Patent, 133,498, of 1918.

An agent for use in concentrating ores by flotation is obtained from greasewood. The plant is macerated, and treated preferably with caustic soda, or with water or acid, or with steam followed by alkali. The agent may be used alone or with a mineral, vegetable, or animal oil, such as oleic acid, or a solution of rubber such as is described in Specification 133,277.

Sulphuric Acid. H. V. Welch, Los Angeles, California, U.S.A. British Patent, 134,015, of 1918.

In the production of sulphuric acid by the chamber process, sulphur dioxide gases from a source 1 are passed through an electric precipitator 3 having a number of tubular collecting-electrodes 6 extending between upper and lower headers and containing axial wire electrodes 4, thence into a Glover tower 16 with packing 20 supplied at 17 with nitric acid, and at 18, 19 with chamber acid and nitrous vitriol respectively, thence to a lead chamber 29 supplied with a water spray at 30, thence through electric precipitators 33, 39 having plate electrodes 42, 43 over which sulphuric acid of suitable temperature to keep the reactions going at the optimum temperature is distributed from perforated pipes 44, 45, thence to a lead chamber 96 supplied with a sulphuric acid spray 97, and finally to an electric precipitator 67, the tubular electrodes

69 of which are supplied with sulphuric acid to serve the purpose of a Gay-Lussac tower. Liquid collecting at the bottom of each tower and precipitator is collected in a suitable tank, that from the Glover tower 16 being used for the chamber 96 and precipitator 67, that from the chamber 29 for the precipitator 33, that from the precipitator 33 for the precipitator 39, and that from the precipitators 39, 67 and from the chamber 96 for the Glover tower 16. The precipitators are supplied with current from alternating mains 106, 107 through step-up transformers, and the current supplied may be unidirectional or alternating, or both superposed, as shown by the connections. The electric precipitator tubes may be of circular, square, rectangular, or polygonal section, and may be of frusto-conical or frusto-pyramidal form.

Aminophenol and Aminonaphthol Derivatives. O. Imray, London. (A communication from the Society of Chemical Industry in Basle; Basle, Switzerland.) British Patent, 133,433, of 1918.

Esters of N-monoarylsulphomonoalkylaminoxyaryl compounds of the general formula $R^2O.R.NR^1R^3$ where R =aryl, R =arylsulphonyl, R^2 =acydyl, including arylsulphonyl, and R^3 =alkyl, and the corresponding compounds in which R^3 is allyl or aralkyl, are prepared by treating bodies of the general formula $R^2O.RNHR^1$ with the usual alkylating-agents (alkyl chlorides, dialkyl sulphates, arylsulphoalkyl esters), or allyl or benzyl halides. According to examples, N-*p*-toluenesulpho-*p*-aminophenol-*p*-toluenesulphoester is methylated by means of methyl chloride or dimethyl sulphate; the properties of the corresponding ethyl, benzyl, and allyl compounds are also described. The corresponding derivatives of *o*- or *m*-aminophenol or aminonaphthols are also referred to. Alkyl-, allyl-, or aralkyl-aminoxyaryl compounds are prepared by the complete saponification of the sulphonamide esters described above—e.g., by hot strong sulphuric acid; an example is given of the production of *p*-methylaminophenol. Arylsul-

phonic esters of aminoxyaryl compounds are prepared by partial saponification by means of acids of sulphonamide esters of the general formula $R^2O.R.NR^1X$, where R =aryl, R^1 and R^2 =arylsulphonyl, X =hydrogen, alkyl, allyl, or aralkyl; according to examples, the *p*-toluenesulphonic ester of *p*-methylaminophenol is prepared from N-*p*-toluenesulphomethyl-*p*-aminophenol-*p*-toluenesulphonic ester, and the benzenesulphonic ester of 1 : 8 : 3 : 6-aminonaphthol disulphonic acid is prepared from 1-N-benzenesulphamido-3 : 6-disulpho-8-oxynaphthalene benzenesulphonic ester; the corresponding derivatives of other aminonaphthol sulphonic acids are also referred to.

Decolorising-carbon. R. W. Mumford, Baltimore, U.S.A. British Patent, 133,759, of 1918.

A vegetable carbon having great decolorising power and great rapidity of action, and capable also of removing finely divided suspended materials from solutions or liquids, is prepared by slowly heating an intimate mixture of moist vegetable matter, colloid material, and a mineral spacing agent, so as first to dry the material and set the colloid, and thereafter slowly to char it, the temperature finally being raised to above 800° C. The mineral spacing agent is selected so that during the charring process gas is slowly evolved, and this has the effect of cleaning the pores of the charred material, the object being to obtain a carbon of open cellular structure corresponding more or less closely to that of the vegetable matter originally taken. As vegetable matter, the following examples are given: Sawdust, peat, lignite, wood pulp, peat moss, bark, maize cobs, residues of alcohol distillation, and brown coal; as colloid material: Solutions of gelatine, potato or rice flour, cornflour, starch and gluten, and inorganic colloidal material such as clay, hydrated colloidal silicates, oxides and phosphates—for example, gelatinous tricalcium phosphate; as a mineral spacing agent: Dolomite, manganese dioxide, and a mixture of magnesium carbonate and phosphatic rock. In an example of the process, the vegetable matter is comminuted, washed with hot water, mixed with gelatinous tricalcium phosphate or boiled with potato flour or starch so as to form a paste, and finely mixed with finely powdered dolomite; the mass is then heated in a retort which can be slowly rotated; the temperature remains for some time at 100° C. until all the water is expelled and the colloid is set, after which it rises slowly until at 250° C. the mass is completely charred; the temperature is then raised to decompose the dolomite which evolves carbon dioxide gas, and this continues until a temperature of 800–900° C. is reached; the material is then dumped into water with the exclusion of air, and the product freed from mineral matters either by sedimentation or centrifuging, or by treatment with an acid; the product is dried and, if desired, ground. In order to control the temperature during the charring process it is convenient to use a reverberatory furnace heated on the surface combustion principle, the material to be charred being spread in relatively thin layers in metal trays which are placed on the sole or hearth of the furnace. Usually it is detrimental to the product to conduct the charring in the presence of steam or products of combustion from any other source, since these cause the carbon to waste away; but in the case of material of less open texture, such as lignite or brown coal, the introduction of steam is in certain cases advantageous. After use, the carbon can be revived by treatment with hydrochloric acid alone, or by washing first with hot water, then with caustic soda solution, again with hot water, and finally with hydrochloric acid; after drying, the product is ready for re-use, and heating in retorts is unnecessary.

Nitronaphthalene. E. de B. Barnett, London. British Patent, 133,918, of 1919.

Naphthalene, prior to nitration by treatment with a mixture of nitric and sulphuric acids, is suspended in sulphuric acid, which may contain 60–70 per cent. H_2SO_4 , or in spent nitrating acid, or in a mixture.

Refractory Materials. R. D. Pike, San Francisco, U.S.A. British Patent, 133,753, of 1918.

Magnesite is mixed with a small quantity of a deodoriser in the form of an iron alloy, such as ferro-manganese or ferro-silicon, and then heated to a temperature such as to cause a reaction reducing the total quantity of oxygen associated with the iron and more or less liberating the metallic iron. The magnesite is ground with water and with the powdered alloy and ferric oxide, and the moulded composition fired to

form refractory articles. The oxide of iron may be omitted in cases where it exists in sufficient quantity in the natural magnesite. Calcined magnesite can be used instead of the raw mineral, preferably with addition of the latter when making the mixture for moulding and firing.

Extracting Paraffin Waxes, Etc. K. H. V. von Porat, Stockholm. British Patent, 133,989.

Paraffin, waxes, oils, and fats are extracted from peat, straw, mosses, lichens, algae, grass, pine-needles, etc., by treatment with terpenes or derivatives thereof, such as turpentine oil and its higher fractions, preferably under heat and pressure.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Catalytic Hydrogenation. Dayton Metal Products Company, Dayton, Ohio, U.S.A. British Patent, 133,666. Convention date, October 5, 1918.

Relates to improvements in apparatus for the hydrogenation of unsaturated hydrocarbons, of the kind in which a mixture of the vapourised hydrocarbon and hydrogen is passed, in a continuous manner and under pressure, over a catalyst maintained at a regulable temperature. The improvements comprise: (1) A reaction chamber surrounded by a number of heating devices separately controlled; (2) arrangements for heat-insulating the whole or a part of the reaction chamber; and (3) a removable cartridge for carrying the catalyst. The apparatus is stated to be specially applicable to the production of cyclohexane from benzene. The hydrocarbon vapour and hydrogen are mixed in a chamber 13 and introduced through the pipe 12 into the reaction chamber 10 containing the catalyst 28. The products of the reaction escape by the pipe 50 to a condenser 51, unconverted hydrogen being returned to the reaction chamber by the pipe 70. A condenser 71 is fitted to the pipe 70 to prevent any loss of the starting-material. The catalyst is contained in a cartridge 26, provided with a flange which rests on a shelf

25 on the inner wall of the reaction chamber 10. As the top 11 of the reaction chamber is detachable, replacement of the cartridge 26 can readily be effected when the catalytic material becomes spent. Surrounding the reaction chamber are a number of electric heating coils 30, separately controlled by the switches 32. Each coil can be encased by heat-

insulating material, constructed in the form of semicylindrical sections 35 hinged together. The hydrogen is introduced into the mixing-chamber 13 from the reservoir 21, the pressure in which is maintained by a pump 22 automatically controlled by the pressure-valve 23. The material to be hydrogenised is forced into the chamber 13 by the pump 16, automatically controlled by the pressure-valve 18, and is vapourised by passage through a heater 17. The hydrogenised material falls from the condenser 51 into a vessel 53, and thence through a tube 54 fitted with a float-operated valve 55 to the tank 56. Some of the product may be diverted into a sampling tube 60 containing a hydrometer 61. A modification of the apparatus is described, in which the catalyst cartridge is withdrawn through the bottom of the reaction chamber, the heating of which is effected by an external steam-coil.

Washing Phosphates, Ores, Etc. C. Poupart, Seine-et-Oise, France. British Patent, 133,320. Convention date, June 20, 1917.

In an apparatus for separating phosphates or other ores or materials from fine matter or gangue of the kind comprising a number of vertically shaken travelling endless belts

on which the material is successively washed, each belt 3 comprises a portion 1 running on rollers 8, 9 so that its edges are upturned, and a discharge portion 2 running over straight rollers. A roller 4 between the two portions is vertically adjustable to vary the water level.

Evaporation and Crystallisation. Aktieskapet De Norske Saltverker, Bergen, Norway. British Patent, 132,787. Convention date, September 16, 1918.

Large crystals are obtained from solutions by ensuring the presence of comparatively large crystals in the zones of highest concentration. In one form of evaporating-apparatus comprising a tubular heater A over which the liquid is circulated upwards by a turbo-pump D, the large crystals settle out in a funnel N and are removed by a conveyor O, and the crystals of somewhat smaller dimensions remain in suspension and are circulated over the heating-surfaces. A rotating drum P with lifting-blades R may be used to restore any crystals that may be deposited to a state of suspension. Alternatively, the whole of the crystals may be deposited and removed from the apparatus, the large crystals being then separated, and the remaining crystals dropped into the evaporator immediately above the heating-surfaces. In another form of apparatus, the liquid is circulated downwards through the heater, and upwards through a separating chamber where the large crystals alone are allowed to deposit.

Purifying Liquids and Gases. P. H. A. Gaillet, Cysoing, Nord, France. British Patent, 133,971. Convention date, October 18, 1918.

Diaphragms built up of pyramidal surfaces are used in apparatus for separating impurities from liquids and gases—for example, for the purification of water, the removal of oil or water from steam, or of dust from coke-oven or blast-furnace gases. According to one method, a diaphragm element is formed by bending over the four corners of a square or rectangular metal sheet along lines parallel to the diagonals, the sheet itself being finally bent along one of its mid-lines. Elements so constructed, when arranged in rows along parallel horizontal supports and combined with another series on supports at right-angles to the first but at a slightly lower level, form a diaphragm of approximately pyramidal surfaces. Chambers through which the liquids or gases are passed are packed with these diaphragms. The diaphragms may be moulded or cast, and glass and porcelain are mentioned as possible materials.

MARKET REPORTS.

WEDNESDAY.

Benzole: London, 90%, 2s. to 2s. 1d.; North, 1s. 11d. to 2s.; 50%, 1s. 10d. to 1s. 11d.; North, 1s. 9d. to 1s. 10d., naked; pure, 2s. 9d. to 3s., naked at works. Carboic acid, crude, 60%, East and West Coast, nominally 2s. 3d. to 2s. 4d.; crystals, 39-40%, 10d. to 11d., f.o.b. Crude tar, London, 50s. to 55s.; Midlands, 50s.; North, 50s. per ton, ex works. Refined tar, 35s. per barrel. Pitch, 85s.; East Coast, 82s. 6d. to 85s.; f.o.b.; West Coast, 72s. 6d. to 75s. f.a.s. Solvent naphtha, naked, London, 90-190%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 95-160%, naked, London, 2s. 9d. to 2s. 10d.; North, 2s. 8d. to 2s. 9d. Crude naphtha, naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthalene, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Cresote, naked, London, 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 8d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: home trade, December, £21., basis 24½%. Nitrate of soda, £22. 10s. to £22. 15s.

FERTILISER MATERIALS

LIVERPOOL, WEDNESDAY.

Nitrate of soda is very steady, the quotation on spot for 95-96% quality remaining at £20. 17s. 6d. per ton, net cash, prompt delivery. East Indian bone meal: There is no change to report in this market, the quotation for January-March shipment being £15. per ton, net cash, ex ship Liverpool, for 1½% ammonia and 52% phosphates. On spot Liverpool, holders ask £16. per ton, net cash, for 4½% and 25% quality. Mineral phosphates are without alteration, and values at present are only nominal. Dried blood is scarce, and full prices are being paid for any parcels offering, the value being about 35s. per unit of ammonia per ton.

LONDON METAL MARKET.

WEDNESDAY.

Copper: Standard brands, £104. 5s. to £104. 10s., cash; £105. 15s. to £106., three months; electrolytic, £115. to £118. Tin: Standard, £324. 5s. to £324. 10s., cash; £325. 15s. to £326., three months; Straits, £324. 10s.; English £323. to £324. Lead: Soft foreign, £44.; English, £44. 10s. Spelter, £54. 5s.; hard, £39. Antimony English regulus, 90%, £47 10s. Aluminium, £150. Nickel, £215., ex warehouse. Quicksilver, £24. Bismuth, 12s. 6d. Platinum, 502s. per oz. Wolfram, 32s. 6d. per unit.

SWANSEA MARKET REPORT.

WEDNESDAY.

Tinplate prices have advanced, and are very firm at 47s. per box, f.o.b. Copper more active at £104. 15s. per ton prompt, and £105. 15s. forward. Tin prices are more regular and steady at £315. cash, and £316. 10s. three months. Lead, £39. 12s. 6d. for Spanish, and £40. 10s. English. Spelter very active at £51. 10s. Antimony, English regulus, 90%, £47. 10s. Nickel in better inquiry at £215., including free delivery London or equal. Zinc sheets remain firm at £73. for English, and £68. for American, f.o.b. New York. Aluminium, £150. Quicksilver, £24. per bottle. Arsenic in moderate demand; white powdered £65. per ton, f.o.b. Sulphate of copper steady, with small export trade, at £41. 10s. per ton, f.o.b. Sulphate of ammonia steady at £21. prompt, and £22. forward. Nitrate of soda firm, with strong demand for export, at £21. 10s. to £22. 10s. per ton, f.o.b. Turpentine firm at £6. 19s. per cwt. net. Oxalic acid selling better at 1s. 3½d. per lb. Pitch has advanced to £3 12s. 6d. per ton, ex ship.

MANCHESTER CHEMICAL MARKET.

WEDNESDAY.

Owing to the approaching holiday and preparations for stocktaking, business generally has a quieter tone, but values all round are firmly maintained, and makers well engaged with orders. For resale lots of caustic soda, 70%, £27. is quoted. Refined bicarbonate of soda £11. to £11. 10s. per ton, and 58% alkali £15. 10s. per ton. Bleaching powder in short supply, and price steady at £17. per ton, softwood casks. Chlorate of soda easy at 5d. per lb. Potash 1s. per lb. Roasted saltcake firm at 70s. per ton, carriage paid. Soda crystals unchanged. Sulphate of copper continues quiet, and quotation nominal at £40. per ton, f.o.b. Liverpool. Nitrate of soda still scarce and dear at £62. per ton. Phosphate of soda £32. per ton. Commercial hyposulphite of soda, bags, £19. per ton. Concentrated sodium sulphide has advanced to £26. 10s., in casks, with only small supplies

offering. White powdered arsenic is unaltered in position or value. Yellow prussiate of potash firm for English make at 2s. 1d. per lb. Soda 1s. 1½d. per lb. Makers are well sold ahead for the latter article. Carbonate of potash steady at £105. per ton, basis 85%. Lead salts are higher: White acetate at £84. 10s.; brown £67.; and nitrate £60. per ton. English brown and grey acetate of lime are scarce, and quotations firm at £15. 10s. and £26. 10s. per ton respectively. Acetate of soda in fair request at £51. per ton delivered. Miscible naphtha 10s. 6d. per gallon. Commencing with the New Year, salammioniac prices have advanced to £95. and £90. for firsts and seconds respectively. Oxalic acid dull at 1s. 5d. per lb.

LIVERPOOL CHEMICAL MARKET.

WEDNESDAY.

The inquiry for chemicals was well maintained until the closing of markets and offices for the Christmas holidays. The business done was mainly on 1920 account, and is reported to have been on a fairly large scale. The demand on export account improved, but the shortage of facilities for railway transport and shipment have latterly impeded the movement of consignments in this branch of the trade. Bleaching powder has again been in moderately active demand, but has been in short supply. For the home trade, £17. per ton, f.o.r. or conveyance, in buyers' packages; and for export, £15. to £18. per ton, are the quotations. Chloride of calcium has had a slow sale, and is £8. to £10. per ton, in casks, f.o.r. Caustic soda continues to meet with a good inquiry and has been scarce. Prices are £24. per ton for 76%; £22. per ton for 70 to 72%, and £21. per ton for 60%. Nitrate of soda has sold more readily, and is £21. 10s. to £22. 10s. per ton. Saltcake has again been in very fair demand, and is £7. 15s. per ton, in casks, f.o.b. Soda crystals have been well inquired for, and are £5. 10s. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been much in request, but has been in short supply. From £8. 5s. to £10. per ton, according to terms of delivery, are the quotations. Borax has been steadily called for. Ordinary is £39. per ton, and powdered, £40. per ton, in bags, less 3% for lots of not less than 50 tons. Ammonia alkali has met with an active inquiry, and is £6. 10s. to £6. 15s. per ton, f.o.r. Hyposulphite has been but little called for, and is £18. 10s. per ton for ordinary, and £22. per ton for pea crystals, in 1cwt. kegs. Sulphite of sodium has had a slow sale, and is £11. per ton for ordinary, and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Sulphide of sodium has been in quietly steady demand, and is £23. per ton in barrels, and £24. per ton in drums. Prussiate of soda has been but little in request, and is 1s. 0½d. per lb. Bichromate of soda has sold rather more freely, and is 10½d. per lb. Phosphate of soda has had a somewhat freer inquiry, and is £30. per ton. Chlorate of potash has been quieter, and is 1s. to 1s. 1d. per lb. Permanganate of potash has moved but slowly, and is 3s. 6d. per lb. Sulphate of potash has been but little in request, and is £23. per ton. Carbonate of potash has sold rather more freely, and is £95. to £100. per ton, for 80 to 85%. Caustic potash has met with a rather brisk inquiry, and is £110. per ton. Nitrate of potash has been in very fair request, and is £60. to £62. per ton for refined, and £40. per ton for ordinary. Canadian potashes have been inactive. Montreal first quality are £200. to £220. per ton, and second quality £190. to £210. per ton. Bichromate of potash has been in fair demand, and is 1s. 6d. per lb. Yellow prussiate of potash has been steadily called for, and is 1s. 10d. to 2s. 1d. per lb. Salammioniac has been in very fair request, and is £90. per ton for first quality lump; £85. per ton for second quality, and £5. per ton extra for crushed. Sulphate of ammonia has been rather more inquired for, and is £21. 7s. 6d. for January, 1920; £21. 15s. for February, and £22. per ton for March to May, 1920. Carbonate of ammonia has again been in very fair demand, and is 7½d. per lb. Muriate of ammonia has been very quiet, and is £45. to £50. per ton. Magnesia has been in quietly steady demand. Carbonate is £2. 5s. per cwt., and sulphate £11. to £16. per ton, according to quality. Alum has been in good request, but has been scarce. Prices are, for home trade uses £18. 10s. per ton, and for export £18. 10s. to £19. 10s. per ton. Aluminoferric has had a very limited sale, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has moved but slowly, and is £12. to £17. per ton, according to grade. Sulphur has been in good request. In English sorts flowers are £32. per ton; roll is £28. per ton, and rock £22. per ton,

in bags, f.o.r. In Sicilian, flowers are £28. per ton; roll is £22. 10s. per ton, and rock £17. 15s. per ton. Cream of tartar has met with a steady inquiry, and is £12. 15s. to £13. per cwt. Tartaric acid has sold more freely, and is 3s. 2d. to 3s. 3d. per lb. Boracic acid has had a moderate sale, and is £72. per ton for crystals; £74. per ton for powdered, and £2. to £3. more in casks. Oxalic acid has had a rather slow sale, and is 1s. 2d. to 1s. 3d. per lb. Citric acid has sold more readily, and is 4s. 4d. per lb. White acetate of lead has had a quietly steady sale, and is £84. to £85. per ton. Arsenic has been in slightly better request, white powdered being £65. per ton. Sulphate of copper has received rather more attention, but the business done in it for home trade purposes has been very small. The price for the home trade is £41. per ton, and for export £41. to £42. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Heavy chemicals are in good demand for both home and export trade, caustic soda and bleaching powder in particular being in strong request. Soda crystals locally are scarce and firm at £5. 10s. per ton, 2cwt. bags. Rock sulphur firm at £24. to £25. per ton.

The following prices are per ton net: Bleaching powder, softs and hards, £17.; caustic soda, 76-77%, £26.; do., 74-76%, £25.; do., 70%, £24.; do., 60%, £23.; recovered sulphur, 2cwt. bags, £25.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5. 10s.; sulphate of soda (salt-cake), £4. 10s.; pure white sulphate of alumina, £19. 10s.; blanc fixe, £22.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.

COALS.—Market is exceptionally firm, and with the prospect of short supply over the holidays very little new business is being transacted. The demand for home trade is enormous. To-day's export quotations, nominally: Best Northumbrian steam, 95s. to 100s. per ton; do., second qualities, 90s. to 92s. 6d.; Northumberland small coal, 75s. to 80s.; do., seconds, 70s. to 72s. 6d.; best Durham gas coals, 83s. to 85s.; do., seconds, 75s. to 77s. 6d.; Durham bunker coals, 70s. to 80s.; do., seconds, 65s. to 67s. 6d.; foundry coke, firm, 105s. to 110s.; gas coke, 105s. to 110s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, WEDNESDAY.

During the past week there has again been strong demand for all classes of heavy chemicals, and a feature of the market is the pronounced activity of both the home and the export trade. Prices, generally speaking, are showing considerable firming up, and some chemicals are to the short side as far as supply is concerned. As compared with the previous week, arsenic has advanced from £65. to £67. per ton; caustic soda from £27. to £27. 5s. per ton; cream of tartar from £12. to £12. 10s. per cwt.; salammmoniac (second lump) from £90. to £99.; and salammmoniac crystals from £70. to £72. Current prices (including the above-noted variations) are now as follows: Arsenic, £67. per ton, net, Glasgow; bicarbonate of soda, £10. 10s. and £12. 10s. per ton for 6-8 cwt. casks and 1cwt. kegs, net, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags; and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £27. 5s. per ton, net, Glasgow; chlorate of potash, 1s. 2d. per lb., net, Glasgow; chlorate of soda, 8d. per lb., net, Glasgow; citric acid, 4s. 2d. per lb., 5%, Glasgow; cream of tartar, 98%, £12. 10s. per cwt., net, Glasgow; paraffin wax, U.K. deliveries, 125°, 6½d. to 6½d.; 121-3°, 5½d to 5½d.; 118-20°, 5d.; 110-12°, 4d. to 4½d.; and 98-102°, 4d. to 4½d.; salammmoniac, £95. and £99. per ton, net, any port, for first and second lump respectively; salammmoniac crystals, £72. per ton, net, Glasgow; saltpetre, £3. 4s. per cwt., net, Glasgow; tartaric acid, 3s. 3d. per lb., 5%, Glasgow.

Among the sea oils the demand is also well sustained, and the year is closing as far as this market is concerned sharply and strongly. Dealings in whale oils are well up to the average, and the quotations for two of the varieties (brown and black) have respectively advanced from 78s. to 80s. and from 77s. to 79s. Yellow is still unobtainable, and pale keeps to its newest level of 98s. Newfoundland cod is still attracting buyers at 82s.; pale seal continues to go into consumption at 98s.; while Menhaden is in the forefront at 82s.—all these quotations being appreciably higher than a month ago.

Conditions are unchanged in the coal trade, and the year is finishing with a strong demand both from industrial and domestic consumers. There are no particular features at the moment calling for special attention, and it is largely the old story of the demand being more than equal to the supply.

SODIUM CYANIDE

Mazatlan, 265 pkgs.

SODIUM HYPO

Oporto, 18 c., £18.

SODIUM NITRATE

Syra, 12 pkgs.

SODIUM SILICATE

Adelaide, 114 bgs.; Auckland, 32 bgs.; Barcelona, 207 pkgs.; Barranquilla, 50 pkgs.; Bilbao, 20 pkgs.; Fremantle, 116 pkgs.; Melbourne, 140 pkgs.; Metelin, 64 pkgs.; Porto Alegre, 10 pkgs.; Montreal, 82 pkgs.; New Orleans, 1,000 pkgs.; Rosario, 100 pkgs.; Rio de Janeiro, 83 pkgs.; Victoria, W.C.A., 22 pkgs.

SODIUM SULPHIDE

Galatz, 2 t. 18 c., £140.; Madras, 2 c., £6.; Rio de Janeiro, 2 t. 14 c., £107.; Rouen, 20 t., £600.

STRONTIUM CARBONATE

Lisbon, 2 c., £3.; Oporto, 2 c., £3.

SULPHOCYANIDE

Barcelona, 2 c., £15.

SULPHURIC ACID

Auckland, 3 c., £15.; Demerara, 1 c., £1.; Falklands, 3 c., £2.; Hong Kong, 10 c., £40.; Suez, 42 t. 18 c., £660.

TANNIC ACID

Barcelona, 4 c., £104.; Helsingfors, 10 c., £210.; Odessa, 2 c., £125.

TAR

Punta Arenas, 3 c., £12.; Taltal, 1 t. 3 c., £45.

TARTARIC ACID

Char Reff, 5 c., £94.; Dunedin, 10 c., £160.; Hiogo, 3 t., £934.; Lytleton, 10 c., £160.; Penang, 5 c., £76.; Porto Alegre, 10 c., £160.; Valparaiso, 3 c., £64.

WOOD PRESERVATIVE

Hoilo, 3 c., £5.; Kano, 9 c., £10.; Singapore, 8 c., £12.; Tarkwa, 3 c., £5.

ZINC CHLORIDE

Bombay, 6 t., £279.; Chittagong, 1 t. 4 c., £59.; Duala, 5 c., £15.

ZINC SULPHATE

Odessa, 10 c., £31.

LONDON.

Week ending December 17.

ACETIC ACID

Barbados, 1 ek., £17.; Cape Town, 3 c., £22.; Genoa, 107 cks., £1,650.; Lisbon, 6 c., £47.; Monte Video, 4 crbys., £30.; Napier, 2 c., £9.; Pt. Elizabeth, 4 c., £27.

ACETO SALICYLIC ACID

Amoy, 5 c. (pt.), £8.; Batoum, 4 c. (pt.), £25.; Brisbane, 1 c. (pt.), £35.; Calcutta, 1 c. (pt.), £10.; Cape Town, 10 kgs., £239.; Piraeus, 9 c. (pt.), £71.; Pt. Elizabeth (F.), 1 c., £6.; Rotterdam, 2 c., £25.; Rouen, 10 brls., £198.

ACETONE

Brussels, 1 dr., £31.

ALUM

Bangkok, 5 c., £8.; Cape Town, 5 c., £6.; Delagoa Bay, 5 c., £8.; Durban, 5 c., £6.

AMMONIA

Italy (via Antwerp), 13 drms., £134.; Bombay, 20 cs., £90.; Buenos Ayres, 5 cs., £8.; Calcutta, 13 cs., £31.; Delagoa Bay, 10 cs., £19.; Durban, 30 cs., £47.; East London, 12 cs., £25.; Penang, 4 cs., £8.; Pt. Elizabeth, 8 cs., £15.; Singapore, 6 cs., £6.; Tientsin, 5 cs., £9.

AMMONIA (ANHYDROUS)

Batoum, 4 cs., £80.; Bombay, 33 cys., £309.; Lisbon, 1 cyl., £21.; Rangoon, 10 drms., £109.; Secondee, 1 cyl., £18.; Singapore, 20 cys., £163.

AMMONIUM ACETATE

East London, 2 cs., £6.

AMMONIUM BENZOATE

Rio de Janeiro, 1 cs. (pt.), £8.

AMMONIUM BROMIDE

Calcutta, 1 ck. (pt.), £20.

AMMONIUM CARBONATE

Bangkok, 8 c., £90.; Belawan Deli, 1 t. 7 c., £110.; Calcutta, 8 c., £44.; Cape Town, 4 c., £15.; Christchurch, 12 c., £42.; Hong Kong, 1 t., £89.; Kilindini, 1 c., £5.; Monte Video, 2 c., £15.; Penang, 1 t. 11 c., £190.; Rouen, 4 t. 18 c., £293.; Reval, 2 c., £10.; Rangoon, 2 t. 16 c., £304.; Shanghai, 1 t. 8 c., £267.; Singapore, 6 c., £38.

AMMONIUM CHLORIDE

Antwerp, 2 t. 9 c., £152.

AMMONIUM FLUORIDE

Demerara, 2 cks., £56.

AMMONIUM NITRATE

Colombo, 100 t., £3,200.; Nantes, 100 t., £3,200.

AMMONIUM PHOSPHATE

Amsterdam, 2 t., £185.; Barcelona (F.), 3 c., £357.

AMMONIUM SULPHOCYANIDE

Shanghai, 1 cs., £5.

AMYL ACETATE

Bilbao, 1 dr., £17.; Brussels, 1 cs. (pt.), £8.

ANTIMONY

Melbourne, 2 t. 3 c.

ANTIMONY SULPHIDE

Christiania, 6 cks., £98.; Melbourne, 24 cks., £776.

ANTIMONY TARTRATE

Rio de Janeiro, 1 cs. (pt.), £8.

ARSENIC

Calcutta, 1 t., £145.; Genoa, 1 t. 2 c., £70.; Monte Video, 14 c., £47.

BARIUM NITRATE

Bombay, 20 drms., 9 cks., £121.

BENZOIC ACID

Danzig, 2 cks., £60.

BENZYL ACETATE

Hong Kong, 1 cs., £35.

BISMUTH

Calcutta, 1 cs. (pt.), £20.; Piraeus, 5 cs. (pt.), £19.; Rio de Janeiro, 4 cs. (pt.), £69.

BISMUTH CARBONATE

Adelaide, 1 cs. (pt.), £11.; Cape Town, 1 cs., 1 cs. (pt.), £32.; Malacca, 1 cs. (pt.), £20.; Piraeus, 5 cs. (pt.), £24.

BISMUTH CITRATE

Adelaide, 1 cs. (pt.), £5.; Constantinople, 3 cs. (pt.), £17.

BISMUTH OXIDE

Constantinople, 3 cs. (pt.), £38.

BISMUTH SALICYLATE

Piraeus, 2 cs. (pt.), £8.

BISMUTH SALTS

Reval, 1 cs., £195.

BISMUTH SUBGALLATE

Batavia, 2 cs., £126.; Piraeus, 5 cs. (pt.), £25.

BISMUTH SUBNITRATE

Batavia, 1 cs., £91.; Danzig, 3 cs., £392.; Rangoon, 3 cs., £200.; Rostoff-on-Don, 2 c., £110.; Swatow, 1 cs. (pt.), £12.

BISULPHITE OF LIME

Bordeaux, 20 cks., £48.; Cape Town, 10 cks., £42.

BORAX

Switzerland (*via* Antwerp), 11 t. 5 c., £721; Calcutta, 5 c., £11; Constanza, 2 t., £104; Cape Town, 4 c., £15; East London, 3 c., £11; Havana, 5 t., £208; Madras, 3 c., £6; Rio de Janeiro, 4 c., £12; Rotterdam, 19 t. 16 c., £1,576; Vienna (*via* Rotterdam) (F.), 20 t., £785.

BORIC ACID

Auckland, 3 c., £17; Calcutta, 3 c., £14; Danzig, 1 c., £9; Foochow, 2 c., £7; Hankow, 2 c., £8; Rio de Janeiro, 6 c., £27; Singapore, 1 c., £6; Tientsin, 4 c., £19.

CACODYLIC ACID

Calais (F.), 1 cs. (pt.), £195.

CALCIUM CARBIDE

Penang, 6 t. 2 c., £155; Pt. Swettenham, 3 t. 9 c., £87.

CALCIUM CARBONATE

Rio de Janeiro, 2 cs., £6.

CALCIUM CHLORIDE

Boulogne, 7 c., £20.

CALCIUM GLYCEROPHOSPHATE

Constantinople, 3 cs. (pt.), £151; Piraeus, 3 cs. (pt.), £8.

CARNAUBA WAX

Antwerp, 5 c.; Lisbon, 3 t. 10 c.

CAUSTIC SODA

Brussels, 24 t. 16 c., £447; Colombo, 1 c., £7; Constantinople, 20 t. 14 c., £544; Perth, 6 c., £14; Rotterdam, 20 t. 7 c., £700.

CERESINE WAX

Antwerp, 2 t.; Melbourne, 1 t.

CHEMICALS (otherwise undescribed)

Bombay, 5 cs., £70; Dunedin, 1 cs., £5; East London, 1 cs. (pt.), £5; Gibraltar, 1 ck., £10; Jamaica, 4 cs. (pt.), £13; Sydney, 6 cs. (pt.), £91; Toronto, 1 cs., £25; Winnipeg, 2 cs., £38.

CHLORIDE OF LIME

Calcutta, 5 c., £30; Piraeus, 2 c., £5.

CHROMETAN CRYSTALS

Paris, 10 cks., £98.

CHIRYSAROBIN

New York, 1 cs., £70.

CITRIC ACID

Buenos Ayres, 2 t. 19 c., £1,269; Calcutta, 1 cs. (pt.), £6; Cape Town, 1 t., £446; Durban, 10 c., £217; Kobe, 5 t., £2,149; Montreal, 1 t., £426; Pt. Elizabeth, 2 c., £53; St. John, N.B., 10 c., £150; Singapore, 12 c., £303; Swatow, 1 cs. (pt.), £5; Suva, 1 c., £16; Toronto, 1 t. 10 c., £638; Yokohama, 5 t., £2,149.

COAL PRODUCTS

Alizarine

New York, 2 cks., £96.

Aniline Colour

Madras, 1 cs., £93; Nelson, 1 cs. (pt.), £17; Singapore, 1 cs., £70; Wellington, 2 pkgs., £98.

Bitumen

Bombay, 167 cks., £928.

Carbolic Acid

Amoy, 5 cs. (pt.), £28; Kobe, 79 drms., £960; Shanghai, 315 cs., £645; Socrabaya, 4 cs., £71; Tientsin, 1 ck., £10.

Cresosote

Malaga, 4 brls., £15.

Cresosote Oil

Calais, 515 brls., £1,000.

Cresylic Acid

Boston, 200 cks., £1,420.

Dyes

Auckland, 3 pkgs., £118; Boulogne, 3 cks., £315; Brisbane, 3 pkgs., £143; Brussels, 2 kgs., £27; Colombo, 3 kgs., £93; Genoa, 63 pkgs., £2,160; Lyttleton, 8 pkgs. (pt.), £333; New York, 1 kg., £90; Sydney, 1 kg., £30.

Naphthalene

Calcutta, 86 pkgs., £303; Penang 10 cs., £25; Pt. Swettenham, 20 cs., £50; Shanghai, 315 cs., £645.

Pitch

Alexandria, 150 brls., £149. Antwerp, 2,180 t., £8,825.

COAL PRODUCTS

Pitch

Boulogne, 455 t., £1,580; Calais, 1,000 t., £3,905; Dunkirk, 460 t., £1,840; Durban, 20 cs., £8; Rotterdam, 3,850 t., £11,745; Stockholm, 140 cks., £166; Treport, 145 t., £580.

Pyridine

Durban, 5 drms., £12.

Tar

Beira, 75 drms., £18; Chinde, 6 brls., £8; Delagoa Bay, 30 drms., £11; Durban, 310 drms., £44; East London, 600 drms., £55; Malaga, 10 brls., £30; Malmo, 38 cks., £63; Mossel Bay, 75 drms., £10; Pt. Said, 3 brls., £8; Sierra Leone, 20 drms., £8.

Toluol

Bangkok, 1 cs., £5; Switzerland, 32 cs., £300.

COPPER CHLORIDE

Amsterdam, 1 t. 16 c., £275.

COPPER SULPHATE

Bangkok, 10 t., £410; Novorossisk, 3 t. 2 c., £175.

CREAM OF TARTAR

Calcutta (F.), 2 c., £34; Calcutta, 2 c., £27; Cape Town (F.), 1 c., £16; Durban (F.), 3 c., £48; East London (F.), 1 cs. (pt.), £8; Geraldton, 2 c., £31; Hiogo (F.), 5 t., £1,300; Piraeus (F.), 3 cs. (pt.), £6; Pt. Elizabeth (F.), 2 c., £32; Rangoon (F.), 1 c., £20; Rio de Janeiro, 1 cs. ETHER

Penang, 1 cs. (pt.), £7; Rio de Janeiro, 1 cs., £9; Wellington, 1 cs., £5.

ETHER (METHYLIC)

Rangoon, 4 cs., £63.

FORMALDEHYDE

Madras, 2 cks., £56; Trinidad, 5 cs., £31.

FORMIC ACID

Montreal, 8 crbys., £43.

FULLER'S EARTH

Colombo, 7 c.; Rotterdam, £475.

GLUE

Pt. Elizabeth, 6 c.

GLUE, SIZE, AND GELATINE

Adelaide, 10 c.; Antwerp, 17 t. 14 c.; Bangkok, 1 t. 5 c.; Boulogne, 6 c.; Calcutta, 10 t. 1 c.; Cape Town, 1 c.; Copenhagen, 1 t. 10 c.; Durban, 11 c.; East London, 4 c.; Gothenburg, 3 c.; Kobe, 4 t. 10 c.; Lisbon, 6 c.; Mossel Bay, 2 c.; Rangoon, 1 c.; Rotterdam, 16 c.; Sydney, 2 c.; Tientsin, 1 t.; Wellington, 6 c.; Yokohama, 2 t. 6 c.

GLYCERINE

Batoum, 10 c., £65; Calcutta, 6 c., £47; Karachi, 2 c., £10; Paris, 9 t. 15 c., £1,174; Shanghai, 1 t., £168.

HYDROCHLORIC ACID

Iddo, 2 c., £9; Singapore, 6 c., £12.

HYDROGEN PEROXIDE

Alexandria, 9 cs., £31; Pt. Elizabeth, 1 c., £6.

HYDROQUINONE

Singapore, 1 ck. (pt.), £23.

IODINE (RESUBLIMED)

Calcutta, 1 ck. (pt.), 1 cs. (pt.), £39; Rotterdam, 2 cs., £202.

IRON AND AMMONIUM CITRATE

Rio de Janeiro, 2 cs. (pt.), £11; Rotterdam, 3 cs., £112; Sydney, 1 cs., £29.

IRON PHOSPHATE

Shanghai, 1 kg., £27.

LACTIC ACID

Sydney, 18 cks., £115.

LEAD ACETATE

Bombay, 17 cks., 40 drms., £470; Calcutta, 10 kgs., £42; Lisbon, 15 kgs., £74; Paris, 37 brls., £763; Rio de Janeiro, 2 cs., £40; Shanghai, 5 cks., £43.

LEAD CARBONATE

Rotterdam, 1 kg., £11.

LITHIUM BENZOATE

Rio de Janeiro, 2 cs. (pt.), £12.

LITHIUM CARBONATE

Rio de Janeiro, 2 cs. (pt.), £7.

MAGNESIA

East London, 2 cs., £6.

MAGNESIA (CALCINED)

Buenos Ayres, 2 cs., £28; Dieppe, 40 cks., 3 cs., £203; Santos, 2 cs., £28; Valencia, 2 cs., £15.

MAGNESIUM CARBONATE

Buenos Ayres, 1 cs., £12; Jamaica, 2 cs., £9; Lisbon, 10 cs., £37; Shanghai, 20 cs., £50; Valencia, 2 cs., £9.

MAGNESIUM CHLORIDE

Montreal, 5 drms., £36.

MAGNESIUM CITRATE

Brussels, 1 cs. (pt.), £12; Calcutta, 8 cs., £69; Piraeus, 1 cs., £11; Shanghai, 3 cs., £24.

MAGNESIUM SULPHATE

Auckland, 5 c., £10; Calcutta, 2 c., £6; East London, 9 c., £21; Porto Alegre, 1 t., £27; Wellington, 1 t. 6 c., £43.

MERCURIALS

Calcutta, 2 cks., 7 cs. (pt.), £220; Piraeus, 3 cs. (pt.), £13; Rio de Janeiro, 5 cs. (pt.), £86.

MERCURY BICHLORIDE

Rotterdam, 4 cs., £300.

MERCURY PRECIPITATE

Danzig, 3 cs., £199.

METHYL SALICYLATE

Batoum, 4 cs. (pt.), £11; East London, 1 cs., £6.

MINERAL WAX

Amsterdam, 20 t.; Lisbon, 2 t. 10 c.; Paris, 20 t. 18 c.

MURIATIC ACID

Piraeus, 2 t. 2 c., £65.

NICKEL AND AMMONIUM SULPHATE

Helsingfors, 2 kgs., £7.

NICKEL SULPHATE

Bombay, 2 cs., £7; Rotterdam, 26 cs., £212.

NITRIC ACID

Bangkok, 10 c., £44; Buenos Ayres, 1 c., £5; Piraeus, 1 c., £13.

OLEIC ACID

Reval, 1 ck., £15.

OXALIC ACID

Boulogne, 9 cks., £412; Constanza, 3 kgs., £150; Kobe (F.), 4 cks., £160; Lisbon, 5 kgs., £36; Rio de Janeiro, 1 cs., £20.

PARAFFIN WAX

Amsterdam, 15 c.

PHOSPHORIC ACID

Antwerp, 5 cts., £50.

PHOSPHORUS CARBONATE

Wellington, 1 cs., £7.

PHOSPHORUS SESQUISULPHIDE

Barcelona, 20 cks., £324; Valencia, 20 cks., £321.

PITCH (BONE)

Melbourne, 11 c.

PLUMBAGO

Amsterdam, 1 t.; Lisbon, 6 c.

POTASSIUM ACETATE

Calcutta, 1 cs. (pt.), £6.

POTASSIUM BICARBONATE

Bangkok, 1 kg., £11; Calcutta, 1 cs., £8.

POTASSIUM BICHROMATE

Brussels, 7 c., £61; Lisbon, 1 c., £10.

POTASSIUM BINOXALATE

Durban, 1 cs. (pt.), £6.

POTASSIUM BROMIDE

Adelaide (F.), 1 cs. (pt.), £6; Cape Town (F.), 1 cs. (pt.), £6; Calcutta, 2 cs. (pt.), £26; Jamaica (F.), 1 cs. (pt.), £13; Piraeus, 2 cs. (pt.), £7; Piraeus (F.), 2 c., 1 cs. (pt.), £56; Rio de Janeiro, 2 cs. (pt.), £23; Shanghai (F.), 3 cs. (pt.), £22; Singapore, 1 cs. (pt.), £6; Sydney, 1 cs. (pt.), £7.

POTASSIUM CARBONATE

Shanghai, 1 cs. (pt.), £6.

POTASSIUM CHLORATE

Cape Town, 15 t. 14 c., £915; Delagoa Bay (F.), 1 t. 10 c., £250; Piraeus, 2 c., £17.

POTASSIUM CITRATE

Cape Town, 2 cs. (pt.), £26; Rio de Janeiro, 1 cs. (pt.), £8; Sydney, 1 cs. (pt.), £9.

POTASSIUM CYANIDE

Bombay, 1 cs., £15; Calcutta, 2 cs., £31; Foochow, 1 cs. (pt.), £6; Rio de Janeiro, 2 cs., £32.

POTASSIUM IODIDE

Calcutta, 2 cks. (pt.), 1 cs., 1 cs. (pt.), £283; Cape Town, 1 cs., £174; Santos, 1 cs., £66; Shanghai (F.), 3 cs. (pt.), £22; Sydney, 1 cs. (pt.), £20.

POTASSIUM METABISULPHITE

Calais, 5 c., £60; Cape Town (F.), 5 kgs., £62; Lisbon, 4 c., £60; Montreal, 80 pkgs., £1,153; St. John, N.B., 1 ck., £14.

POTASSIUM OXALATE

Buenos Ayres, 10 cks., £124.

POTASSIUM PERMANGANATE

Boulogne, 5 c., £115; Bangkok, 5 kgs., £171; Genoa (F.), 1 c., £51.

POTASSIUM PRUSSATE

Lisbon, 4 c., £46.

POTASSIUM SULPHATE

Rio de Janeiro, 1 cs., £11.

POTASSIUM SULPHOGALICACOLATE

Calcutta (F.), 3 cs. (pt.), £13.

PYRO ACID

Swatow, 1 cs. (pt.), £7.

QUININE

Bombay, 421 ozs.; Calcutta, 335 ozs.; Singapore, 147 ozs.

RESORCIN

Cape Town (F.), 1 cs. (pt.), £7; East London (F.), 1 cs. (pt.), £5.

SALAMMONIAC

Buenos Ayres, 1 c., £5; Calcutta, 1 c., £9; Durban, 3 c., £14; Monte Video, 2 c., £11; Sydney, 3 c., £13.

SALICYLIC ACID

Bombay, 1 cs., £15; Lisbon, 1 cs. (pt.), £9; Melbourne, 10 cs., £140; Piraeus, 1 cs. (pt.), £8.

SALT

Colombo, 1 t.; Madras, 4 t.; Singapore, 4 c.; Tientsin, 4 c.

SALTCAKE

Ghent, 100 t. 19 c., £454.

SALTPETRE

Adelaide, 2 t. 3 c., £166; Barcelona, 3 t., £165; Brisbane, 3 c., £11; Lisbon, 1 t. 9 c., £78; Paris, 1 t., £54; Rio de Janeiro, 2 c., £13; Singapore, 2 c., £10; Valencia, 2 t. 1 c., £117.

SHEEP DIP

Buenos Ayres, 94 t. 2 c., £4,582; Christchurch, 18 t. 17 c., £917; Oamaru, 1 t. 10 c., £74; Pt. Elizabeth, 10 t. 3 c., £463.

SILVER NITRATE—
Piraeus, 1 cs. (pt.), £18.

SOAP—
Aden, 6 c.; Alexandria, 15 t. 10 c.; Amsterdam, 15 c.; Antwerp, 105 t. 15 c.; Auckland, 2 t. 2 c.; Bangkok, 6 c.; Batum, 6 t. 11 c.; Bilbao, 19 t.; Beira, 1 c.; Bombay, 3 t. 5 c.; Bordeaux, 47 t. 17 c.; Boulogne, 1 t. 13 c.; Buenos Ayres, 17 c.; Calcutta, 1 t. 7 c.; Cape Town, 8 c.; Channel Islands, 15 c.; Christiania, 10 c.; Christiansund, 5 c.; Cologne, 42 t. 16 c.; Colombo, 10 t. 3 c.; Constantinople, 2 c.; Copenhagen, 1 c.; Danzig, 13 c.; Cyprus, 2 c.; Durban, 4 c.; Delagoa Bay, 3 c.; Genoa, 6 t. 11 c.; Hamburg, 60 t. 6 c.; Hong Kong, 3 c.; Jamaica, 1 t. 8 c.; Kilindini, 1 c.; Karachi, 7 c.; Lisbon, 4 c.; Manila, 9 c.; Montreal, 9 c.; Mossel Bay, 1 c.; New York, 3 c.; Oporto, 3 c.; Ostend, 4 t. 16 c.; Palermo, 4 c.; Paris, 6 t. 14 c.; Perth, 3 c.; Piraeus, 4 t. 5 c.; Penang, 12 c.; Pt. Said, 1 t. 8 c.; Pt. Swettenham, 1 c.; Pt. Elizabeth, 10 c.; Pt. SODA CRYSTALS—
Beyrout, 5 t., £31.; Cape Town, 3 t., £25.; Jaffa, 5 t., £31.

SODIUM AND POTASSIUM TARTRATE—
Calais, 5 cks., £62.

SODIUM ARSENITE—
Durban, 4 t. 1 c., £220.

SODIUM BENZOATE—
Calcutta, 1 ck. (pt.), 3 cs. (pt.), £37.; Lisbon, 1 cs. (pt.), £30.

SODIUM BICARBONATE—
Auckland, 3 c., £5.; Beyrout, 10 t., £110.; Buenos Ayres, 2 c., £12.; Calcutta, 1 t. 11 c., £83.; Durban, 6 c., £10.; Jaffa, 5 t., £55.; Monte Video, 12 c., £40.; Mossel Bay, 4 c., £7.; Rio de Janeiro, 4 c., £8.; Santander, 2 c., £6.; Shanghai, 1 t., £33.; Swatow, 1 c., £8.

SODIUM BISULPHITE—
Buenos Ayres, 3 t. 1 c., £95.; Suva, 1 c., £7.

SODIUM CACODYLATE—
New York, 1 cs., £114.

SODIUM CITRATE—
Pt. Elizabeth, 1 cs. (pt.), £7.; Rio de Janeiro, 1 cs. (pt.), £14.

SODIUM CYANIDE—
Fremantle, 6 t., £558.

SODIUM HYPO—
Hankow, 7 c., £16.

SODIUM IODIDE—
Calcutta, 2 cs. (pt.), £15.; Piraeus, 5 cs. (pt.), £15.

SODIUM METABISULPHITE—
Montreal, 80 pkgs., £1,153.

SODIUM NITRITE—
Barcelona, 4 t. 19 c., £395.

SODIUM PYROPHOSPHATE—
Florence, 1 t. 19 c., £159.; Rotterdam, 1 cs., £6.

SODIUM SALICYLATE—
Bombay, 1 cs. (pt.), £21.; Calcutta, 3 cs. (pt.), £9.; Cape Town, 1 cs. (pt.), £20.; Piraeus, 8 cs. (pt.), £26.

SODIUM SULPHATE—
Gothenburg, 5 c., £9.; Hong Kong, 7 t., £60.

SODIUM SULPHATE (GLAUBER SALTS)—
East London, 11 c., £8.

SODIUM SULPHIDE—
Bordeaux, 28 t. 18 c., £725.; Calais, 38 t. 14 c., £1,050.; Melbourne, 19 t. 18 c., £497.

SODIUM SULPHITE—
East London, 6 pkgs., £11.; Soerabaya, 3 cs., £15.; Winnipeg, 1 c., £7.

SODIUM TARTRATE—
Adelaide, 1 kg., £11.; Calcutt., 1 kg., £8.; New York, 2 t. 10 c., £313.

STEARINE (PITCH)—
Christiania, 1 t.

STRONTIUM CARBONATE—
Paris, 2 cks., £30.

STRONTIUM LACTATE—
Calais (F.), 1 cs. (pt.), £15.

STRONTIUM NITRATE—
Bombay, 19 drms., 12 cks., £208.

SULPHUR—
Lisbon, 1 t. 1 c., £32.; Madras, 1 t., £39.; Paranagua (F.), 1 t. 16 c., £52.; Rio de Janeiro (F.), 2 t. 19 c., £87.; Santos (F.), 1 t. 4 c., £34.

SULPHURIC ACID—
Iddo, 6 c., £38.; Singapore, 6 cs., £10.; Wanganui, 2 c., £5.; Wellington, 1 c., £5.

SUPERPHOSPHATES (otherwise un-
Colombo, 50 t., £750. described)

TANNIC ACID—
Lisbon (F.), 4 kgs., £98.; Piraeus (F.), 1 kg., £5.; Suva, 1 kg. (pt.), £5.

TANNIN ALBUMINATE—
Switzerland (F.), 1 kg., £20.

TARTARIC ACID—
Barbados, 1 cs., £9.; Bombay, 1 t. 4 c., £445.; Durban, 8 c., £156.; Kobe (F.), 5 t. 8 c., £1,870.; Malaga, 2 c., £34.; Melbourne, 1 t., £347.; Montreal, 1 t., £310.; Rangoon (F.), 8 c., £185.; Rio de Janeiro, 4 c., £86.; Yokohama (F.), 8 t. 1 c., £2,755.

THEOBROMINE—
Piraeus, 5 cs. (pt.), £12.

WAX—
Antwerp, 1 t. 10 c.; Barcelona, 3 c.; Bordeaux, 1 t.; Buenos Ayres, 1 c.; Calais, 12 c.

WHITE LEAD—
Bangkok, £11.; Boulogne, £1,785.; Calcutta, £145.; Calais, £250.; Durban, £60.; Lisbon, £122.; Malaga, £10.; Mombasa, £34.; Melbourne, £310.; Oran, £13.; Pt. Said, £10.; Naples, £56.; Pt. Elizabeth, £68.; Punta Delgada, £7.; Ostend, £22.; Singapore, £361.; W'lington, £50.

ZINC SULPHIDE—
New York, 2 cks., £90.

MANCHESTER.

Week ending December 17.

ACETIC ACID—
Antwerp, 7 cks.; Smyrna, 11 cks.

ALUM—
Dunkirk, 70 brls.; Boston, 250 cks.; St. John, N.B., 10 brls.

ALUM (CHROME)—
Antwerp, 10 c.

ALUMINA SULPHATE—
Antwerp, 100 bgs., 432 cks.; Bordeaux, 230 bgs.

ALUMINA SULPHOCYANIDE—
Rouen, 4 cks.

ALUMINO FERRIC—
St. John, N.B., 918 slbs.

AMMONIA—
Bordeaux, 17 drms.; Rouen, 44 drms.

AMMONIUM CARBONATE—
Antwerp, 10 cks.; Gothenburg, 90 kgs.; Salonica, 15 brls.; Rouen, 35 cks.; Tunis, 5 pkgs.

AMMONIUM MURIATE—
Rouen, 100 cs.

BLEACHING POWDER—
Dunkirk, 32 cks.; Bordeaux, 135 cks.

BORAX—
Antwerp, 248 cks., 30 bgs.; Rouen, 50 bgs.

CARBON BISULPHIDE—
Gothenburg, 8 drms.

CAUSTIC SODA—
Dunkirk, 29 drms.; Gothenburg, 50 cs.

CHROMIUM OXIDE—
Boston, 1 kg.

COAL PRODUCTS (otherwise undes.)
Antwerp, £9,212.; Aviles, £4,518. Bordeaux, £2,583.; Calcutta, £548.; Boston, £1,200.; Dunkirk, £248.; Havre, £50.; Rotterdam, £100.; Rouen, £720.; San Esteban de Pravia, £3,635.

COAL PRODUCTS—
Creosote Oil

Dunkirk, 50 cks.

DISINFECTANTS (otherwise undes.)
Bombay, 50 cks.

DYESTUFFS—
Sumac Extract

Bombay, 5 cks.

FATTY ACIDS—
Antwerp, 40 brls.

FERRO MANGANESE—
Bordeaux, 4 brls.; Philadelphia, 750 t.

GLUE—
Antwerp, 40 bgs.

GLYCERINE—
Dunkirk, 4 drms.

LEAD ACETATE—
Constantinople, 2 cks.

MAGNESIA—
Tunis, 2 cs.

MAGNESIA (CALCINED)—
Antwerp, 1 cs.

MAGNESIUM CHLORIDE—
Bordeaux, 66 kgs.; Ghent, 22 drms.

OXALIC ACID—
Dunkirk, 12 cks.

PARAFFIN WAX—
Christiania, 8 brls.

PITCH—
Antwerp, 1,012 t.

POTASSIUM BICHROMATE—
Rotterdam, 1 ck.

SALAMMONIAC—
Salonica, 15 brls.; Smyrna, 2 brls.

SALT—
Ghent, 10,000 bgs.; Gothenburg, 3,105 bgs.

SALTCAKE—
Christiania, 500 t.; St. John, N.B., 1,680 pkgs.; Gothenburg, 330 pkgs.

SALTPETRE—
Bordeaux, 3,284 bgs.

SOAP—
Antwerp, 955 cs., 100 pkgs.; Bombay, 29 cs., 60 bxs.; Haifa, 150 cs.; Rotterdam, 5 cs.

SODA ASH—
Bombay, 22 cks.; Gothenburg, 3,280 bgs.

SODA CRYSTALS—
Alexandria, 102 brls.; Gothenburg, 50 bgs.

SODIUM BICARBONATE—
Rotterdam, 10 bgs.; Gothenburg, 120 bgs.

SODIUM HYDROSULPHITE—
Gothenburg, 18 pkgs.

SODIUM SULPHATE—
Bordeaux, 148 drms.; Calcutta, 5 cs.

SODIUM SULPHIDE—
Christiania, 27 cks.; Rouen, 88 drms.

STEARINE—
Gothenburg, 61 brls.

SULPHUR—
Gothenburg, 6 brls.

WAX—
Antwerp, 40 bgs.

ZINC CHLORIDE—
Bombay, 34 cks.; Antwerp, 7 cks.; Ghent, 5 drms.

MIDDLESBROUGH.

Week ending December 20.

AMMONIUM SULPHATE—
Kobe, 956 t., £20,607.; Yokohama, 100 t., £2,186.

COAL PRODUCTS -

Naphthalene

East London, 1 t., £17.

DISINFECTANTS (otherwise undes.)
Natal, 6,370 galls., £1,274.

PITCH—
Antwerp, 836 t., £2,976.; Calais, 416 t., £1,352.; Rotterdam, 1,848 t., £6,006.

SALT—
Algoa Bay, 2 t. 10 c., £103.; Cape Town, 3 t., £109.; East London, 1 t., £41.; Natal, 1 t. 10 c., £69.

SODIUM SILICATE—
Kobe, 40 t., £485.

SODIUM SULPHATE—
Gothenburg, 288 t., £937.

WOOD PRESERVATIVE—
Natal, 9 c., £21.

NEWCASTLE-ON-TYNE

Week ending December 20.

ANTIMONY—
Goth'burg, 1 t.; Copenhagen, 2 t.

BLEACHING POWDER—
Antwerp, 25 t.; Copenhagen, 5 t.; Gothenburg, 24 t. 18 c.; Rotterdam, 112 t.

BORIC ACID—
Gothenburg, 2 t.

CARNAUBA WAX—
Bergen, 6 c.

CAUSTIC SODA—
Canea, 10 t.; Genoa, 206 t.; Gothenburg, 40 t. 6 c.; Rotterdam, 11 t.

CERESINE WAX—
Bergen 10 c.

CHEMICALS (otherwise undescribed)
Bergen, 1 t. 12 c.

CHINA CLAY—
Bergen, 21 t. 5 c.

CHROME ORE—
Rotterdam, 20 t.

COAL PRODUCTS—
Pitch

Antwerp, 747 t.

GELATINE (EDIBLE)—
Copenhagen, 5 c.; Bergen, 3 c.; Copenhagen, 8 c.

GLUE—
Copenhagen, 5 t. 3 c.

RED LEAD—
Antwerp, 1 t. 9 c.; Copenhagen, 1 t. 6 c.; Gothenburg, 16 t. 1 c.; Rotterdam, 15 t.

SOAP—
Antwerp, 20 t. 17 c.

SODIUM HYPOSULPHITE—
Antwerp, 1 t.

SODIUM SULPHATE—
Gothenburg, 4 t. 17 c.

SODIUM SULPHIDE—
Antwerp, 21 t.

SULPHUR—
Gothenburg, 10 t.

SULPHURIC ACID—
Bergen, 4 c.

WHITE LEAD—
Antwerp, 5 t. 3 c.; Rotterdam, 2 t.

N. & S. SHIELDS.

Week ending December 20.

RED LEAD—
Stockholm, 20 t. 10 c.; Malmö, 10 t.

SWANSEA.

Week ending December 20.

AMMONIUM CARBONATE—
Naples, 9 t. 16 c., £618.

CHEMICALS (otherwise undescribed)
Rouen, 3 c., £4.

NICKEL SULPHATE—
Genoa, 8 t. 5 c., £490.; Rouen, 3 t., £190.

SAL ACETOS—
Rouen, 3 t., £585.

PRICES CURRENT.

WEDNESDAY, Dec 24, 1919.

PREPARED BY MESSRS. HIGGINBOTTOM AND Co, 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified
The prices in different localities may vary

Acids:—

			£	s.	d.

BEAUMONT'S CENTRIFUGAL PUMP.

SEE CATALOGUE FOR
REGULUS METAL
TURBINE PUMPS.

It will pump any thick, hot, heavy, or sedimentary liquid. It will suck from 11 ft. to 25 ft., and deliver from 5 ft. to 75 ft., according to size of pump.

It will lift ten times as much as any bucket or force pump, size for size.

It will pump Liquid Acid **more economically** than any other system. All parts of this pump are made to a standard gauge, so Repairs can be done quickly and cheaply. It is noted for great capacity, powerful suction, and slow speed. **These Pumps always kept in stock.**

SPECIALISTSin the manufacture of
"HIGH PRESSURE"**ANTIMONIAL
LEAD PIPES**for use in Chemical Plant where
high pressures are encountered.Very great care is taken in the
manufacture, and the pipes pro-
duced combine great rigidity and
strength with high acid-resisting
properties.Please consult us concerning your
requirements.**COOKSON & COMPANY LIMITED,**
NEWCASTLE-ON-TYNE and LONDON.**Help Your Chemists
to Efficiency**

IF there is an absence of a regular flow
of good gas in your laboratory you
are handicapping your staff—they are
striving against unfair odds and they
cannot give of their best. It may be
difficult to obtain ordinary gas, but

**The Willett Petrol-Air Gas
System for the Laboratory**

has been devised to meet every requirement of the
chemist in this direction. All lighting and heating needs
are well supplied by the free-from-trouble, weight-driven
Willett Generator. Entirely automatic in action and not
requiring expert attendance, it works without vibration,
noise, or smell, generating whatever quantity of gas is re-
quired at the moment.

If you are working at a dis-
advantage, don't tolerate it
any longer; send to-day for free
Booklet A.Y., which describes in
detail the Willett System for the
Laboratory.

FILTER CLOTHS OF BLUE ASBESTOS

HAVE YOU TROUBLE WITH YOUR ACID FILTERS ?

C.T.S.

THEN use Blue Asbestos, which is acknowledged throughout the chemical trade to be a vastly superior acid-resistant than white asbestos. After two hours' immersion in sulphuric acid, at a temperature rising from 15° to 110° C., it shows a loss in weight of only 2½% as compared with 40% in the case of white asbestos. With hydrochloric and nitric acids a greater proportionate difference is noticeable. Thus is shown the advantage of *Blue Asbestos* filter cloths and bags.

NEW CHEMICAL PLANT FOR SALE.

All to be seen near Manchester.

Low Prices will be accepted.

1 BELT CONVEYOR, 18in. wide, C.I. sectional side, frames 38ft. long, 10 double iron roller carriers, fast and loose pulleys, etc.
6 SWAN NECK 60in. Watson Laidlaw HYDROS, self-balancing, suspended. Water turbine driven, 24in. turbine. Control valves, brakes, water connections, No. 18627 upwards. Practically new.

2 DUPLEX STEAM DRIVEN PUMPS, suitable for driving above hydros, by Watson Laidlaw, steam cylinder 14in. dia., 10in. stroke, 8in. plunger, with air vessel, 2½in. stop valve, 2½in. auto shut-off valve, spring relief valve, sight feed lubricators.

1 M.S. SPIRAL CONVEYOR, 37ft. long, 7in. dia., worm in rivetted casing, supported by 3in. by 3in. M.S. Channels, 5 hangers, 4 jockey pulleys.

2 RIVETTED STILL, 8ft. dia., 9ft. high, 7/16in. plate fitted, 90ft. 3in. W.I. steam coil, level gauge, etc. Mounted on 4 C.I. columns, 4½in. dia. by 4ft. 6in. high.

WET VACUUM PUMPS (Edwards' Air Pump), rope drive, single throw, 9in. dia. cylinder by 15in. by 10in. stroke (160 cubic feet free air per minute). Rope pulley 3ft. 7in. by 6½in. 4 grooves.

1 BELT CONVEYOR, 24in. wide, 3 flanged C.I. driving pulleys, 18in. by 6in., 14 C.I. roller carriers and 7 return ditto, 6in. dia. C.I. side and frames, 58ft. 6in. long.

One new gas-heated CASCADE CONCENTRATOR, consisting of 20 acid-resisting dishes, with number of spare dishes.

40 GALVANISED CRYSTALLISING TANKS, 6ft. by 4ft. by 1ft. 6in.

Three NEW VACUUM DRYERS complete with Pumps and Condensers. American make—lying in New York. Prompt Shipment. First-class make. Guaranteed by advertisers. Plans, Price, etc. Delivered here.

Four LARGE ROTARY CONTINUOUS VACUUM FILTERS (New). Latest pattern, capable of doing the work of 20 large frame presses without any labour. Thorough extraction. Filtrate drain through wet vacuum pump or dry vacuum system can be used. Cake delivered automatically on to Band Conveyor.

One 8in. ROTARY PUMP. Harland Engineering Co., with half coupling.

NEW GAS JACKETED CASES AND BURNERS, by Fletcher, Russell & Co., Ltd., for two 100-gallon pots and one 200-gallon pot.

(NEW 1919) ONE MAGNIFICENT DRYING INSTALLATION, Motor, Fan, Ideal Boilers, Radiators, Air Ducts, Racks and 5,000 Plywood Trays. Capable of drying 100 tons weekly. Cost over £3,000. Low price. Can be seen running.

1 Oliver CONTINUOUS VACUUM FILTER, for Acid. Filtering capacity, 40 tons per day.

Large quantity CAST-IRON TANKS, all sizes, for sale at £10 per ton. Good condition.

1 WEIGHBRIDGE, by Hodgson and Stead, 10-ton capacity. No. 5880.

NEW FULLER 42in. CENTRIFUGAL BALL MILL, 60 H.P. required, grinds and delivers at one operation up to 200 mesh 4 to 6 tons per hour of hard rock, like Cement, Pyrites, Rock Lime, etc. Can be seen running by appointment.

1 NEW RAYMOND IMPACT PULVERISER, 0000 size. This machine grinds 200 to 1,000 lbs. hard material per hour, separates and delivers the material by air separation up to 200 mesh, is absolutely dustless, and specially suitable for changing from one material to another without cleaning. 6 H.P. required to grind and sift. Floor space 5ft. by 5ft. Specially suitable for wholesale druggists.

1 NEW VACUUM SHELF DRYER, 12 shelves, each 42in. by 42in., total shelf surface available 121 sq. ft. (one side), complete with belt-driven pump and suitable condenser. Packed ready for ralling. Guaranteed in every respect. American make.

1 NEW VACUUM PUMP, water jacketed, 400 cubic ft. displacement per minute. Single Cylinder, 14in. by 8in. 11-15 H.P.

1 Nearly New WET VACUUM PUMP (Single-throw Edwards' Air Pump), 26in. dia. by 12in. stroke, C.I. flywheel, W.I. belt pulley, 36in. by 12in., capacity 737 cubic ft. per minute. Shafting and 3 pulleys, coupling, etc., for above.

1 C.I. VACUUM RECEIVER, 4ft. 6in. dia. by 5ft. deep.

2 CYLINDRICAL MIXING VESSELS, approximately 7ft. dia. by 14ft. 6in. long, constructed of mild steel plates, steam jacketed all round, and having an 18in. manhole on top and 10in. outlet valve at the bottom. A strong shaft is fitted inside, having stirring arms arranged zigzag along its length. Shaft is driven by fast and loose pulleys through double-reduction spur wheels; the vessel is carried on strong C.I. cradles, and the driving gear on concrete pliers; overall dimensions, including driving gear, are approximately 21ft. 6in. by 8ft.

1 BUCKET AND CHAIN ELEVATOR, 27ft. centres, 12in. buckets fitted with feed hopper, with controlling slide and grid and delivery shoot, chain drive, 2 countershafts, 2 belt pulleys, 4 pedestals, wall box, 2 brackets, and 2 rolled steel channels; 1 spur driving wheel.

1 DUPLEX STRAIGHT LINE STEAM-DRIVEN AIR COMPRESSOR, 2 steam cylinders, 11in. dia. by 12in. stroke; 2 air cylinders, 20in. dia. by 12in. stroke; 5½in. dia. crank shaft; C.I. flywheel, 6in. dia. by 10in. face; stop valve and lubricators; on C.I. bed; by Reavell, Ltd.

1 CHAIN ELEVATOR, 20ft. centres, M.S. buckets average 9½in. by 6in. by 6in. deep, C.I. shoe with hopper and delivery shoot, spur driving gear and belt pulley, and 76ft. of 6in. by 3in. rolled steel channels, angle and flat bar iron framing.

9 M.S. VACUUM FILTERS, 5ft. dia. by 5ft. 6in. high, ½in. plate; upper portion removable; fitted with trunnions for lifting and perforated bottom for filtering; with branches for vacuum and discharge.

1 VERTICAL STEAM ENGINE, 12in. dia. cylinder by 12in. stroke, 2½in. dia. piston rod, 4in. dia. crank shaft; C.I. flywheel, 5ft. dia. by 10in.; C.I. belt pulley, 18in. dia. by 12in. face; Tangye governors and stop valve, cylinder lubricator, and C.I. framing by Tangye.

1 TWIN HORIZONTAL VACUUM PUMP, cylinders 10in. dia., 12in. stroke; C.I. flywheel, 4ft. 6in. dia. by 5in. face; C.I. fast and loose driving pulleys, 4ft. dia. by 5in. face; and W.I. belt-shifting gear, C.I. box bed.

3 48in. WATER-DRIVEN HYDRO EXTRACTORS, brand new condition, with water motors mounted on framing of rolled steel joists and plates, starting gear and safety covers and swivel shoots, from delivery; by Pott, Cassels, and Williamson.

1 HORIZONTAL DUPLEX STEAM PUMP, for above Hydros; steam cylinders 16in. dia. by 10in. stroke; pump barrels, 8in. bore; C.I. air vessel and pressure gauge; stop valve; C.I. suction pipe, strainer and sluice valve.

3 NEW ELEVATORS (by Robinson, of Rochdale), complete with Balata belt and buckets.

2 NEW RUBBER BAND CONVEYORS, in wood casings (by Robinson, of Rochdale), including brush to sift the material, 25ft. each.

2 NEW WOOD FEEDING SHUTES, with permanent magnetic.

2 NEW SIFTING REELS (by Robinson, of Rochdale), 2ft. 6in. dia. by 12ft. 0in. long.

SO₂

THESE FURNACES

ARE ENTIRELY

MADE IN ENGLAND

WITH BRITISH CAPITAL

BY

BRITISH LABOUR.

15,000 IN DAILY USE.

The complete plant for making SO₂ solutions consists of air pump, air reservoir, sulphur burner, and counter current cooling apparatus, and as each plant is carefully made to suit the capacity of the burner (which is made in six sizes), it forms a small and compact plant, saving space and labour as well as giving enormous economy in the amount of sulphur burned—usually one-half.

COMPLETE INSTALLATIONS

For General Bleaching and Preserving, especially for
Bleaching Liquid Sugar, Glue, Gelatine,
Flour, Cereals, Offal, Fibre, Straw Hats,
&c., &c.

Patent Sulphur
Furnace with
combined water
cooling, lighting,
feeding, and
cleaning
arrangements.

SO₂

Advantages.

- Simple Manipulation.
- Guaranteed Efficiency, 95 per cent. of Sulphur Burned.
- Saving of 50 per cent. of Sulphur.
- No smearing or clogging of Pipes.
- Burning Sulphur visible from the outside.
- Easy and Effective Cleaning without taking to pieces.
- No escape of the SO₂ during working.
- Complete immunity from gas poisoning by the workman in-charge, even by continuous working.
- No masonry required.
- No expense in mounting.
- No trouble in lighting.
- Greatest durability.

are usually supplied, but when desired we can supply burner alone. We have testimonials showing that over 99½ per cent. of efficiency is obtained from the sulphur by our system, and a **SAVING of 50% in SULPHUR.**
